
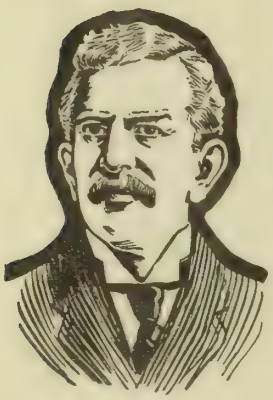
"Use My New 'George' 100 Year Metal Shingle on the Roof and My Zinc Covered Corrugated Iron on the Walls of your Barn"

This is the Shingle I Recommend for Barns

"My son, George H. Pedlar, Jr., invented this big shingle, just before he died. He planned a big shingle for big roofs to lay in one-tenth the labor time needed for cedar. We made up and tested them for three years. Now we place them on the market. The "George" is 24x24 ins. and saves labor on big roofs. The "Oshawa" which is used all over the world, is 16x20 inches. It is used on ordinary size roofs or complicated roofs."

"I recommend the "George" Shingle for good size barns. It costs the same as my "Oshawa" shingle per square. Both are in 100-year metal. Both cutclass cedar, rolls, etc., as my shingles are fire-proof, lightning-proof and sure-proof. These two shingles are the triumphant result of 50 years of labor in making good barn roofs. With the recent rise in cost of labor and wood, my metal shingle is now the most economical roof in Canada."

GEORGE H. PEDLAR.



"I Have been making metal shingles for farm barns for half a century. I found recently a hundred-year metal for my shingle. It surpasses and outclasses anything else in the world that a man can use for a barn roof. You want a 100-year roof on your barn, at about the cost of cedar shingle, don't you? Of course, you do."

"Well, that means my shingle. My metal shingle will cost any farmer less to-day, and be lighter and stronger than cedar shingle. This is because my shingle saves many dollars for labor cost in laying. My shingle needs no paint. Once this cost advantage did not exist. But now-a-days labor cost of laying is very high. Wood shingles are of poorer quality and advanced cost. All told my roof on the barn itself is the utmost value your money can buy—is to-day's most economical roof."

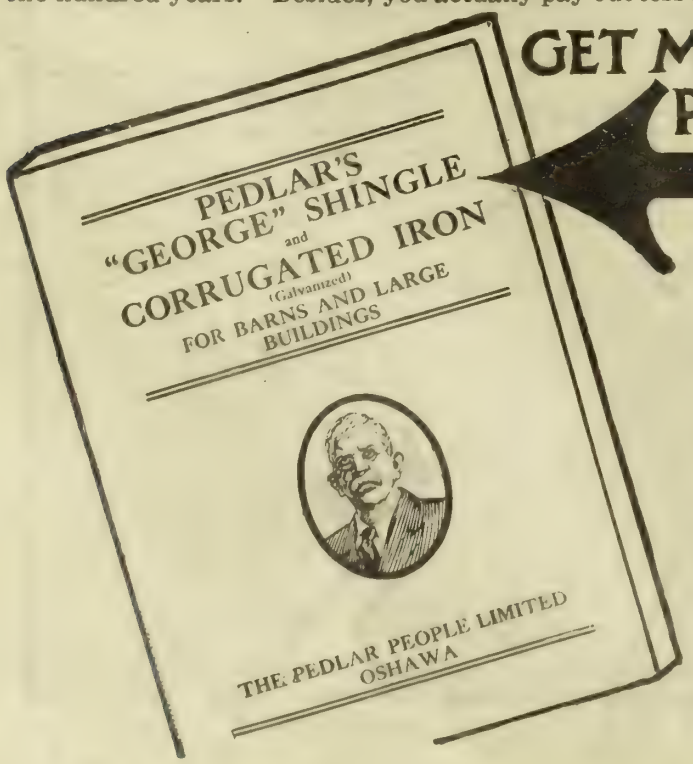
"A barn built without my shingle is going to cost you more in actual dollars to-day, and next year, and every year, that you need to spend. It is going to be a leaky barn sooner or later. You will pay higher fire insurance. You will take bigger fire risk. You will either pay out money for roof repairs, or see your hay and grain rot year after year from poor roofing material. Only my shingle in metal will stop these troubles from the beginning. It will give service for one hundred years. Besides, you actually pay cut less money for my roof when laid, than for a cedar-shingle roof laid and painted properly."

"But that is not all in lowering barn cost. The time has come to stop using lumber sidewalls. Labor and lumber is too expensive. Use my galvanized, corrugated iron for the walls. It is fireproof and strong. It is applied swiftly in 8-ft. sheets, saving days and days of wages. Besides cutting out painting, every sheet of my iron is a brace that strengthens your barn framing against sagging and wind pressure. A barn with my shingle and my sidewalls in metal cost less than the same barn with cedar shingles or roll roofing and lumber walls, when you figure in labor and paint. Use my corrugated iron for your barn walls, and my metal shingle for your roof—save money, get a lightning-proof barn, and get a longer-lasting barn than any other way.

"Write my nearest office about your new barn or remodelling your present barn. Tell us the dimensions. We will tell you what shingle and walls in metal will cost you and what they will save in labor and paint."

"Send them a letter to-day. I now have two sizes of metal shingle for you. My big shingle, the "George" is 24x24 inches. My "Oshawa" is 16x20 inches. According to the size of your barn, we will tell you the right shingle to use. Even the big "George" Shingle does not cost more per roofers "square"; your roof and its shape determines the size you need. My corrugated iron goes with either shingle."

G. H. Pedlar



GET MY NEW PEDLAR BOOK FREE

Why not have my little book? It shows how a barn is built with my shingle and corrugated iron siding. It is a straight talk about making a better barn at less cost than the old way, and making it fireproof as well.

My nearest branch will send you this book free. I have just written it. It is my personal message to you. A post-card will bring it.

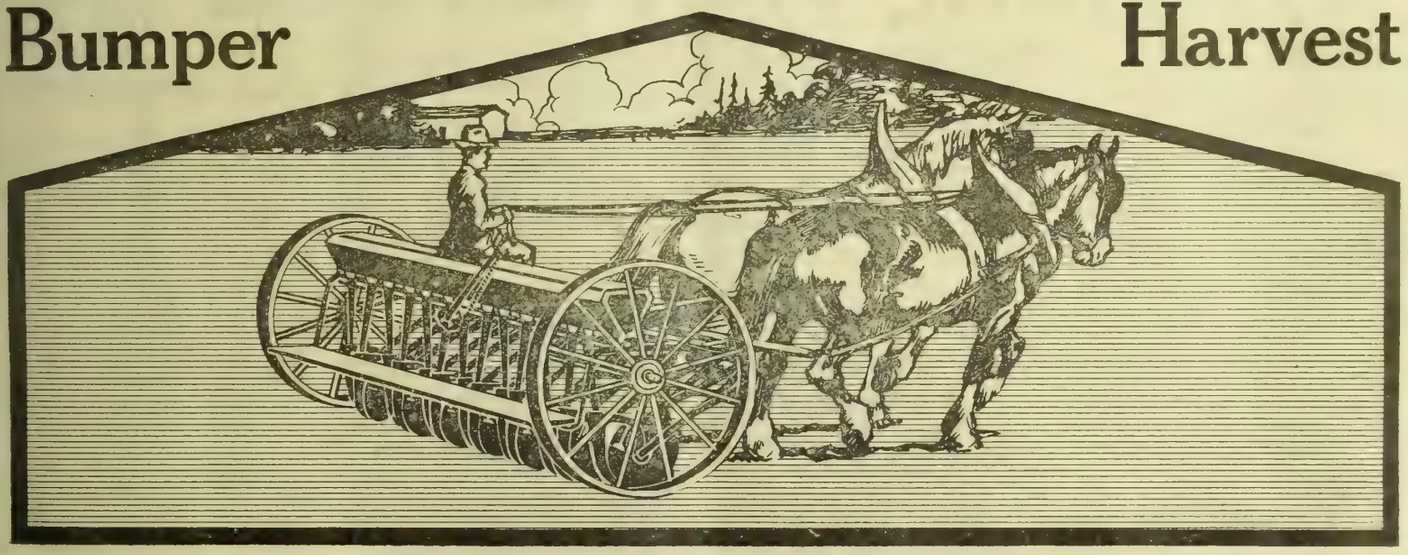
A "Cockshutt" Drill Makes a Bumper Harvest



GET a Cockshutt Drill. You will benefit for many years. You will give your seed and your land a fair show.

You sow in rows six inches apart. This means you get three to five extra bushels, just by using a Cockshutt drill. Remember this is profit. These extra bushels are found money for every acre you seed with a Cockshutt.

Plan right now for a new seeder—write us a letter asking for details. Remember, this means $50 to $100 of extra profit for you for years to come.

SEND US A POSTAL!

Write us a card. Say "I want more information on Cockshutt drills." This does not obligate you to buy. It will get you facts about the Cockshutt—show you how perfectly designed it is. This is one of the lightest draft drills on the market. That alone ought to give it the preference. But when you consider its effectiveness—the harvest it brings you, the crop it protects, the early spring growth it insures, the Cockshutt Seeder is THE DRILL. Write that card to us to-day, please. Now is the time to investigate.

THE Cockshutt Drill is made with a strong I-beam frame that keeps all discs at the same height. It is carried on wide-tired wheels revolving on short axles with renewable bushings. The draft is always light. The discs are self-cleaning. They drop trash automatically. The boots cannot clog with mud. The discs are self-oiling. The feed won't smash, break or bruise the kernels--is always accurate

Your Crop Needs a "Square Deal"

The Cockshutt Feed gives you perfect control of the seeder. The feed is always just right for your land. The "I"-beam keeps your drills up, without sagging. This means that you sow just enough seed at just the right depth for a quick start. You get prompt, early, even growth—half the battle for a big harvest.

KEEP YOUR TEAM GOING

The Cockshutt Disc "draws away" from the trouble-proof grain boot. As trash rises on a disc, it simply falls off, instead of wedging. This keeps your drills running steadily. You have no stops. You sow without an hour's delay from the day you start seeding till you are done. This means big money saved in wages, and full advantage of spring growth.

GUARD AGAINST DROUGHT

The close-set rows seeded only six inches apart are protection against drought. Your crop shades your land so well in June and July that drought trouble is minimized. The Cockshutt Drill brings you the full benefit of summer rains, simply by giving a compact crop that uses every drop of rain for growth.

Get Five Extra Bushels Per Acre

With the Cockshutt your crop gets an even, early start. It grows compactly. It takes full advantage of summer rain. It ripens evenly. It gives the same crop on six acres that you now get from seven acres. You get five extra bushels per acre per year using a Cockshutt Drill You don't pay a cent extra for seeding--in fact, you pay less wages and do the seeding quicker.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Llght" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

SUSSEX, N. B.

We do not sell these burners but each subscriber may get two beside one we furnish free by sending 35 cents for each additional one wanted.

DE LAVAL
CREAM SEPARATORS

There's no good reason why you should wait till spring before getting one

On the contrary you may buy a DE LAVAL NOW and save half its cost by spring. Moreover, if you can't conveniently pay cash you can buy a DE LAVAL machine on such liberal terms that it will actually pay for itself.

As to your NEED of a separator, if you have the milk of even a single cow to cream you are wasting quantity and quality of product every day you go without one. This waste is usually greatest in cold weather and with cows old in lactation, and it counts most, of course, when butter prices are high. Then with the separator there is always the sweet warm skimmilk, and saving of time and labor, in addition.

When it comes to a choice of separators DE LAVAL superiority is now universally recognized. Those who "know" buy the De Laval to begin with. Those who don't "know" replace their other separator with a DE LAVAL later—thousands of users do that every year. If you already have some other machine the sooner you exchange it for a DE LAVAL the better.

Why not start 1913 right in dairying? SEE and TRY a DE LAVAL NOW when you have plenty of time to investigate thoroughly. The nearest DE LAVAL agent will be glad to set up a machine for you and give you a free trial of it.

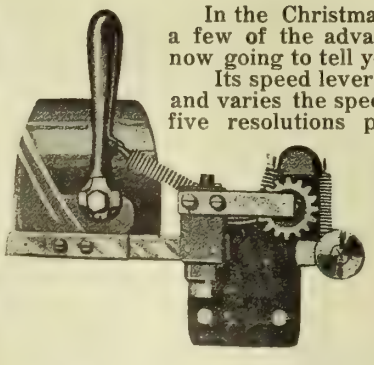
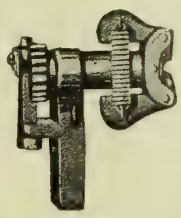
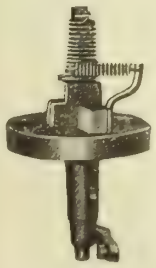
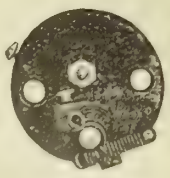
STRONG POINTS OF THE WATERLOO BOY

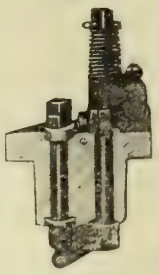


Speed Lever







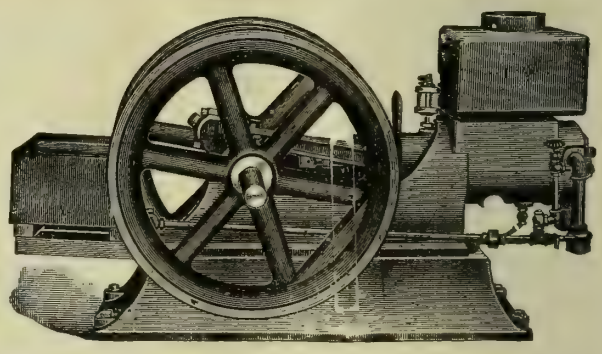


Igniter

In the Christmas Number of this paper we mentioned a few of the advantages of handling our engine. We are now going to tell you a few of our engines strong points.

Its speed lever works like the throttle of the locomotive and varies the speed ***while running*** from fifty to seventy-five resolutions per minute. The old reliable fly-ball governor keeps the speed absolutely steady, no matter how much the load varies and the automatic fuel regulator uses fuel ***only*** when needed for power, ***making it the cheapest engine to run.*** We have an improved patent mixer that does away with the expense and bother of a pump and, our new patent igniter is as simple and positive as a pair of scissors.

The Waterloo Boy is the simplest engine made—has the fewest parts, least chance to get out of order, easiest to manage, and is the nearest automatic in action and "fool proof" in construction, frost proof and starts easiest in coldest weather—no bucking or stalling. All working parts interchangeable—made by skilled workmen in a factory with a capacity of 140 engines complete a day—in the biggest and best equipped factory in the world devoted exclusively to gasoline engines. Every part is exact in size and finish, made of the best material and heavier and stronger than will ever be required.



This great engine is advertised in the leading farm papers ***everywhere*** Right now we are telling your customers about its advantages and about its recent great International victory. They are going to want the Waterloo Boy and we are going to bring them RIGHT INTO YOUR PLACE OF BUSINESS, TO GET IT—enthusiastic prosperous ***men with the money to buy.*** We will back you up squarely, fight with you against every rival—we absolutely guarantee the Waterloo Boy, not only to you but ***to your customer, too.***

Here's a big line— a size for every need. Let's get together—***Are you with us?*** Then write for our proposition today—tomorrow your competitor may be in the band wagon and ***the man with the Waterloo Boy is the one that WILL GET THE BUSINESS.***

Remember we have a winning offer ready for you, so fill out the coupon or pin it to your letterhead and mail to-day.

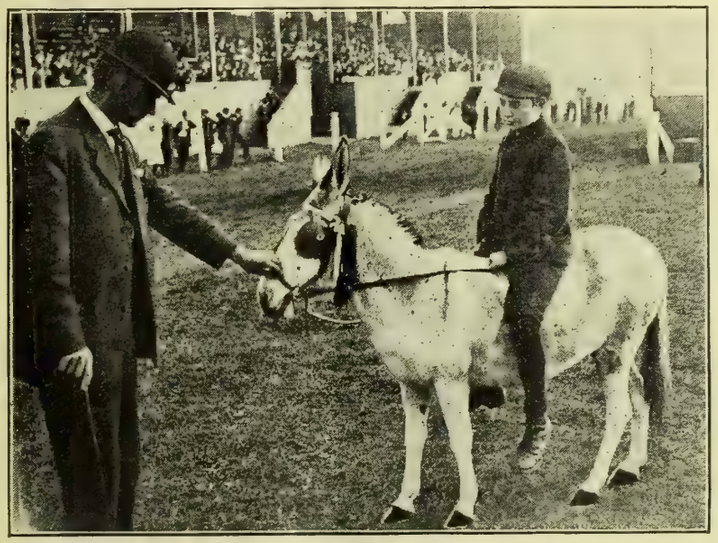
Care and Application of Stable Manure

A Practical Farmer's Methods

By W. M. Lea, P. E. I.

NO branch of farm work is more important and probably none so carelessly handled, as the saving and application of stable manure. Few indeed, seem to consider the almost inestimatable value of fresh stable manure to our Maritime soils. Valuable not only for the amount of plant food contained, but also for its varied beneficial actions on every kind of soil.

A wise provision of nature has so composed the make-up of soils, that no greedy man can completely crop out and impoverish a farm, then pull up stakes and move on in his work of destruction. Only certain elements or proportions of plant food can be removed. When the supply is cut off no more can be made available without the application of some form of fertilizer or stimulant. Fresh stable manure, as a fertilizer, is in a class by itself not only in the content of the elements of fertility in the best balanced proportions for every variety of farm crops, but in the myriads of bacteria that have such a beneficial effect in assisting the liberation of much fertility—and also in adding humus, that great moisture retainer, to the soil.



Posing a Prize Winner

Every farmer knows, or should know that manure contains its greaest value the day it is voided from the animal, and every day it is kept under conditions favorable for decomposition or for leaching out in any form its fertility becomes less. Believing such to be correct what method of saving and application should we adopt to prevent the smallest possible amoumt of loss between the time it is voided from the animal, until absorbed by the soil? We must have tight stable floors, and for this purpose nothing equals a concrete floor. It does not take many years of the liquid leakage through old wooden floors to pay for a good concrete floor, this is one of the very first improved short cuts to wealth that should be attempted. Then decide on some system for handling the droppings daily.

Many farmers advocate the hauling of manure to the fields to be spread at once, and where this can be conveniently attended to it has much to recommend it, up till the time when frost and snow are on the ground. After this I do not approve of spreading manure broadcast as we lose entirely too much fertility by leaching.

In this climate it is no trouble to keep manure in perfect condition until spring. Just do as our commission men do with perishable food products, "put it in cold storage." So long as it is frozen hard no fertility can escape. This is the practice I have followed for several years and I find it most satisfactory. The stables are daily cleaned into a sleigh and drawn directly to the fields, where we keep the pile spread very thin so that all damp manure is frozen hard. We can drive up on the pile. The frost stays in the heap until the manuer spreader can be started in the spring. If all manure is in the field where it is to be applied we can, with a spreader, make a much quicker and better job than by any other method. We used to use a shed for storing but found it hard to keep the manure from heating. If it was piled too deeply much leaching was occasioned by the great pressure. Heating and leaching cau se great loss. We also have tried the several years, spreading directly on the field from the stable, and although our fields are level, we always found that when manure was spread on snow and there was any depth of frost in the ground, we had a noticably lighter crop than when the balance of the field was finished off in the spring.

In Winters, when we happen to have little or no frost in the ground there seemed to be little difference, but when spread on frost and ice the loss was very great. However, this method seemed to be popular with many of our most progressive farmers in other provinces so I persisted in trying it until thoroughly convinced that on our farm at least, we lost greatly by applying manure in winter.

Where manure has been carelessly handled in and around the barn, or partly clear of the stable door and allowing what snow happens to fall to be composted with it to wash out fertility during the thaws of spring, probably the loss is no greater than when it has to waste on the frozen field, but neither should ever be practised.

I think it will pay every farmer to use a manure spreader, either as his own property or if too expensive for his circumstances, as a jointly-owned machine with his neighbors.

Of all the machines usually found on a farm I consider the manure spreader the most profitable. Where good farming is carried on, is where each year's quantity of manure is greater than that of the last. The spreader is a necessity. It is a great labor saver, next to the binder, the greatest labor saver we use. It is also a money-maker as well, in so far as we get much greater value from the manure when handled by this machine.

We often see a deep trench filled level with manure immediately before the root crop is planted on it, and the assurance given us for this heavy interment, I can't call it dressing, "that despite all these theories we always find that we get the biggest crops where we put the most manure." Probably they do, but they don't know the great waste of fertility thr ugh this practice. P. E. Island soil is principally a sandy loam with good natural drainage, a soil that responds readily to good culture, but is a poor retainer of manure. We cannot manure for future generations. Our best practise is to manure as often as possible with as light a dressing as will grow a paying crop, consistent with the fertility already available and the variety of crop we intend to grow. We must not bury manure in a trench. You may plow most of the bulk of it up again but much of the fertility is washed down with the subsoil.

For corn land we top-dress some kind of grass land, allowing as great a growth as possible of grass before ploughing, but for roots we apply as eary as convenient in the spring, plough lightly, just enough to cover the manure, then when we start to cultivate immediately before planting. The land will so absorb the finely and evenly distributed manure that we hardly find any traces of it. The little we do apply is thus made immediately available for the crop. We may not have as heavy a crop but we invariably have a paying uniformly good crop, but double or treble the acreage of the farm will get a badly needed dressing. Where we give even a very light dressing of manure we can always depend on getting a catch of clover, so our policy is to get over as great an acerage every year as possible. We topdress grain land that we are seeding down to clover. Here is another place where the spreader can be used to great advantage, we always apply manure after the grain has appeared, partly for the reason that in the rush of spring work we find it impossible to get at it earlier, and partly for the reason that I think it does really better this way as the manure is washed evenly around the plants with any rains we may happen to have, and mulche the damp land below. The lightest dressing is easily noticed in both grain and clover crops, 8 to 10 loads of a 40 bu. spreader will, on what is considered poor run down Island soil, bring a good crop of grain and I have often observed that where a spreader was available many odd acres of land were given a dressing with the scrapings and leavings of manure found around a yard that but for the use of the machine would be wasted.

Good farming in the Maritime Provinces will include the returning of all crops back to the soil in the form of stable manure, and if this is accomplished as soon as possible withou any loss of fertility our farms will rapidly become more fertile by the extra gain of the action of bacteria on

the physical condition of the soil, on the liberation of inert fertility contained therein, and on the amount of fertility being yearly added by the growth of clover made possible by this dressing of manure. In conclusion I would say: See to your floors, if they are concrete well and good, use all the absorbant you can; but if wooden, and open do something even this winter to remedy it. I have found dry clay that can always be had in cellars at this season to be a good absorbant, and in time to calk a floor. Then put your manure in cold storage as quickly as possible, and in the spring make an effort to get the use of a spreader. If you have never used one before have patience at first, both you and the horses will get used to it, and like it, especially yourself. If your farm is rolling or hilly put your pile in the highest corner and spread down, and and if your horses are light put plenty of them on. When you get to know it, you will find a way to work it anywnere.

Home Grown Seed Superior to Imported Seed

Since the organization of the Canadian Seed Growers' Association the old belief "that in order to grow good crops it was absolutely necessary to change the seed every two or three years" is fast dying out. Farmers are beginning to see that they can grow as good, and even better crops from seed produced on their own farms than from seed brought from a distance although there are still many farmers who believe that it pays them to change their seed every few years. This has not been my experience.

Five years ago I adopted the system recommended by the Canadian Seed Growers' Association for growing seed wheat and oats. I obtained pure seed from members of the association in an adjoining country. The wheat had been selected for 7 years and the oats for 3 years before I got them. I have been using the product of this seed ever since and it is improving every year. At least I can assure you, it has no notion of taking the old disease commonly called "running out."

When we consider the fact that this wheat after being grown in Nova Scotia for 12 years won first prize in the standing crop competition in Colchester with the highest score of any field in the province. It should convince the most doubtful one that the farmers of Nova Scotia can successfully grow their own seed and with a little care in selecting seed will improve instead of "running out."—R. D. MacKay, Balmoral Mills, N. S.

Four Years Experience in The Hand Selection of Seed Potatoes

By the crop reports that our New Brunswick Government send out, we find our average crop of potatoes for the Province of New Brunswick runs about 180 bushels per acre. Granting that there are 10,000 hills in one acre of potatoes this would give 1 1-12 pounds per hill. This, of course, as we all know is easily beaten by probably every farmer in this room. However, these reports are made up from actual conditions throughout our entire province and therefore must be taken as a basis for comparison.

There are several points that have come under my observation in my work with potatoes these last four years that I trust I can make of interest this afternoon.

The C. S. G. A. work attracted my attention and upon studying the situation I decided to take up the work of selecting potatoes. Four years ago, much to the amusement of some of my neighbors, I planted a few hills of potatoes according to the rules laid down by the Association. The result in the Fall was a most remarkable one to me and those interested. Many hills were only fit for feeding while others were of fine type and had many individual, marketable tubers. These, of course, were saved separately with a proper record until the next year. My next year's work showed very few hills not desirable. The third year's work were all of very desirable quality. At digging time I invited the neighbors to come and see. One of my best hills when dug and weighed at this time was found to weigh 11½ pounds. This has been my best record. That particular hill had a good chance as the season was favorable and a good record was made. This season not being so favorable I did not excel last year's work.

One thing in my work has been very noticeable—that my fourth year's records show my best hills to come from my best hills of the first year, plainly proving "like begets like."

Coming back to the first part of my remarks about crop and yield per acre, I may state that my best hills the first year weighed three pounds and by breeding up, the average at present is from six to seven pounds per hill. Comparing this with the average yield per acre for the Province of New Brunswick we see a vast difference and one worthy of a great deal of consideration by our thinking farmers.

In giving my explanation of these results I can say to you strongly—take up this line of work, meaning at the same time to make it a success, and perhaps even greater results will be granted you. The rules of the Association are simple, the product of your labors are yours and your satisfaction and reward will come in digging out of Mother Earth such hills as these.

To prove to the meeting that such results from a few year's work as I have been telling you about can be duplicated or even excelled, I have had these few hills brought here for this afternoon. They are from "Acadie Farm," Memramcook, owned by Emlie Legere. Mr. Legere got his few selected potatoes from me two years ago. This is the result of his second year's work. Mr. Leger is to be congratulated upon the accomplishment of such results. He is calling the attention of many of his neighbors to the results and I have no doubt but that the work will spread rapidly in his section. Another proof of the benefit of selected seed I have here in my hand from Louis A. Green, Fox Harbour, N. S. Two years ago he wrote me for my method of growing and selecting potatoes. In the fall of the same year I received a letter saying that he had beaten every record in that part by producing 315 bushels per acre. This letter dated Nov. 11th states that when he gets his rotation properly going he believes the 500 bushel mark can easily be reached.

Men! these are results worthy of our best consideration and while we acknowledge the soil for potatoes may be better in one part than another, they will adapt themselves to a variety of soils and what has been done can be done again. From England we read of one and two thousand bushels per acre and we wonder how such results are produred. Perhaps we can see now how the result may be accomplished .

My aim would be reached if by these few rambling remarks this afternoon I can help some brother farmer to grow two potatoes where one grew before.—C. Fred Fawcett.

Editor's note: A letter from Mr. Louis A. Green appears on another page of this issue. Mr. Green reached the 400 bushel mark this year,

Royal Seal

Comments Re Potatoes

Comments upon the potato crop this year would lead one to believe that there are some remarkably heavy yields. The writer also was told some glorious stories of good yields of potatoes in 1911, while doing judging in the standing crop competition of Victoria Co., N. B. and the yield of 1912 threatened to be quite as good as that of the previous year.

We hear of potatoes of about two lbs. in weight, and of some goodly numbers per hill. One exhibitor gave the information that his crop would average eight potatoes per hill, and he picked a number off the top of the bin when done harvesting that averaged two lbs. each. It would have been nice to induce the judge to believe that good potatoes would average along about twelve lbs. per hill. It apparently never occured to the exhibitors to count up and find how many pounds potatoes do average per hill.

It surprises many people to know that two lbs. per hill as potatoes are generally planted will produce about 120 bbls. per acre.

In selecting in my own field this fall to obtain some good producers for seed for next year, I found some good hills. The heaviest single hill weighed six and one-quarter lbs. and they were not plgnted far apart either. Fifteen inches was the distance between hills. Hills will produce twice as much if twice fifteen inches apart, and from selected seed. Why can't we get such yields from all the hills? —Wm. H. Moore, Scotch Lake, N. B.

The Object of the Canadian Seed Growers' Association and How to Get Farmers Interested.

The Seed Growers' Association came into existence to meet the demand for better seed and therefore for better crops all over the country.

What is good seed and how can we get it? What I would call good seed, and I think everyone that grows good seed will agree with me, is a large plump kernel which has body enough to supply sufficient nourishment to feed the young plant after germination, until such time as the small rootlets reach out into the soil to get plant food there. Such seed should also have come from strong, vigorous parents in order that it may be able to transmit its good qualities. We know by experience that large, well-developed kernels will produce strong and vigorous plants if they have the right conditions. You will often see in a field some plants standing above the others. What is the reason for this? As far as I can find out it is due to the large plump kernels that had good vitality and breeding and was thus able to push ahead of the others and take more plant food from the soil.

The next consideration is How to get this good seed? I do not know of a better system than that adopted by the Seed Growers' Association, with which you are all familiar. Although with the majority of the farmers it is not known nor understood so well as it should be. The production of good seed grain is one of the best means for improving the agricultural conditions of a country; but in this work of seed selection the soil cultivation must be considered. The farmer, by the judicious use of selected seed, thorough cultivation of the soil, rotation of crops and the use of farm manures can materially improve

the yield and quality of his crops, secure a larger income for his labor, and conserve and utilize to better advantage the soil wealth of his farm.

Some one has said "feed is half the breed" in the case of animals. Is this not also true with plant life? Yes, just as true. A great many of our grain growers are prone to put their seed into the ground and trust to luck that there may be plenty of food in the soil to carry the plant on to a complete development. They never realize that a quick, vigorous growth is just as essential for the production of a good plump kernel of high vitality as it is in the development of a prize animal. The first important step before chosing the foundation stock of seed for any crop is to ascertain the variety best suited to the locality where it is to be grown. Not only should the best variety be selected, but the best seed of that variety that can be obtained should be secured.

You will often hear the remark: "My seed has run out, I will have to make a change." So far as my experience goes this is not necessary, and we have abundant proof from ex- [illegible] seed growers to the same effect. Sometimes a change of seed is a dangerous practice. The theory that seed necessarily 'runs out' and requires a change from locality to locality is misleading.

To explain what I have said I will give you one or two illustrations from reliable sources. First, I would refer to the Macdonald Robertson seed competitions, which were conducted three years in which the awards were based upon the number and weight of kernels per hundred heads. In regards to total yield, in Spring Wheat, there was a gain of 19 bushels per acre. Another object lesson showing the advantage of selected seed is given by Prof. Zavitz, of Geuelph, whow showed that from large plump seed the yield was 16 bushels more per acre than from small plump seed. One of the objects of our Association is to direct the actions and minds of the farmers in general in the direction that will profit them most. I would strongly recommend that the system that is adopted by the Canadian Seed Growers' Association, be taken advantage of—a system which will be found practicable and profitable by every farmer. It has been said by some one "give the farmer the idea that he can add very much to the proceeds of his farm and he will at once try to find out how the increase can be made." So the first thing we must do is to impress upon him that he can do such a thing on his farm by following intelligent methods. Talking is of little use in convincing the majority of our farmers; but if we can show him through some object lessons how other farmers have accomplished the desired results—they will catch on as quickly as any other class.

It seems to me that more general attention might be paid to Seed Fairs, the making of displays of improved seed growing by members of the association at the regular exhibitions, the offering of special prizes for exhibits with details as to how samples were grown and increase, if any, from former years, would be beneficial. One other thing I would like to see, and that is the offering of prizes to farmers' sons for competition on judging grain. A great deal may be done also in interesting the farmers through the Field Competition in standing grain. I know from experience that all who enter the competition are always willing and glad to hear all the judge has to say. In my estimation, the judge in the Field Competition has a great privilege for giving information to the farmer about good seed and how to get it.

There is another matter that I would live to hear a discussion on at this meeting. Last February at our annual meeting in Ottawa, a question came up in regard to the selling of registered seed. The question was, if I remember rightly, "Should any farmer that bought registered seed from a member of the C. S. G. A. and sowed it, be allowed to register the product without becoming a member of the association and having a seed plot for one year?" It was not decided at the meeting and it will come up again at the next annual meeting. As there are some members here who will likely be there, they could express the views nf this meeting on the subject. In conclusion I would urge the preaching of the gospel of good seed anywhere and every- Show the advantage to be gained by the use of good seed and you will find a demand for such seed arising all over these Provinces. Men will always be found ready to produce an article which people want and for which the public is prepared to pay a good price.

Paper read by D. Innes, before the Maritime Branch, C. S. G. A., at Amherst.

Potato Growing on Clover Hill Farm, Lunenburg Co., N. S.

In the summer of 1912, the Government of Nova Scotia offered ten prizes for a potato growing contest, open to farmers all over the province.

Wallace Rhodenizer

Proprietor Clover Hill Farm, Bridgewater, N. S

Wallace Rhodenizer's Oxen Hauling 70 Bushels Potatoes

The fourth prize in this contest was awarded to Clover Hill Farm, Bridgewater, N. S. of which Mr. Wallace Rhodenizer is the proprietor.

The area entered in competition was one-half acre of loam soil ploughed in August 1911. Part of the field was sod land and the remainder new land that had been broken two years ago and on which a crop of oats had been grown in 1911. The plot had been harrowed a number of times in the autumn of 1910. Mr. Rhodenizer does not believe in cultivating too much in the fall as he considers that there is a tendency to liberate too much plant food that may go to waste during the winter and early spring before the plants send out enough rootlets to make use of it. He, however, finds it necessary, in some cases, to harrow in the fall in order to destroy as much couch as possible.

The plot was manured in May at the rate of twenty tons of barn yard manure per acre spread as evenly as possible.

Mr. Rhodenizer planted some early potatoes on a portion of his plot early in May; the balance was planted with late varieties in June.

The sets were dropped in every second furrow—furrows five inches deep.

For commercial fertilizers, Mr. Rhodenizer prefers to buy the chemicals and mix them at home. For his potato crop he uses 4 cwt. Nitrate of Soda, 4 cwt. Potash and 12 cwt. Acid Phosphate mixed and distributed on top of the potato sets at the rate of 10 cwt. per acre after which the manure and earth are raked in to cover the rows.

The potatoes used were of the Carman variety, cut two eyes to a set, and sprinkled with slaked lime as soon as cut. The potatoes used in planting this plot were selected from the best producing hills at digging time in 1911—a system of selection to which Mr. Rhodenizer pins a great deal of faith for improving the producing quality of seed.

Six days after the sets were planted he harrowed the plot with a spike tooth harrow and before the tops broke through the ground he harrowed again.

As soon as the tops could be distinguished in the rows the cultivator was started until during the season the plot was cultivated eight times

He sprayed when the tops were six inches high and at other stages four times during the season. The last spraying was made about the time the tops covered the rows and interlocked branches. Potato bugs were quite plentiful on the early varieties but the sprayings kept them in check. From one acre treated as above, Mr. Rhodenizer harvested a crop of 440 bushels of marketable potatoes.

In regard to the season Mr. Rhodenizer says that after the middle of July rains descended in little noods as if preparing to float another ark. Notwithstanding the wet weatner the potato crop in Lunenburg County was excellent although a little rot showed in some sections.

The cut of ox team on this page is Mr. Rhodenizer's five-year-old team girting 7 feet 6 inches on which he captured second prize at the local exhibition. In the cut they are hauling a seventy bushel load of potatoes.

In Lunenburg County the farmers think a great deal of their ox teams. Mr. Rhodenizer can plow an acre with his pair in six hours.

Feeding Scabby Potatoes to Stock.

In the study of potato scab at the Maine Experiment station no published data could be found regarding whether the germs of the disease were killed in the passage of the digestive tract of domestic animals. That is, can scabby potatoes be fed to the horse, cow, sheep, etc., without having the manure of these animals carry the germs of the disease?

It is a well-known fact that potato scab will persist in infected soils for an undetermined period, at least 25 years or more. It has also been demonstrated repeatedly that the application of fresh stable manure to the soil, immediately before planting, tends to increase the amount of scab on the resulting potato crop.

Following two experiments the station now reports: It would seem that germs of potato scab are able to pass the digestive tract of both the horse and the cow and go into the manure pile without being destroyed, but much more readily in the case of the former than with the latter animal. The manure of horses fed on scabby potatoes is very likely to carry the germs of the disease. On the other hand manure from cows fed a moderate quantity of potatoes which are not excessively scabby, is probably not a serious source of contamination.

Much of Maine's best potato land is either free from or only slightly affected with scab. Owners of such land should realize that this is a valuable asset and should strive to keep it in this uncontaminated condition. The common practice of depending largely upon commercial fertilizers and of plowing under clover to supply humus in growing potatoes not only helps to prevent the introduction of the scab germs into the soil, but also tends to make the soil conditions unfavorable to their development. Even here, there is a great danger from using scabby tubers for seed purposes Experiments conducted at this station and elsewhere have repeatedly demonstrated that the only safe course to follow is to use nothing but clean, healthy tubers for seed and these should be disinfected with formaldehyde before planting.—N. E. Homestead.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said :—"I saw" your adv. in the MARITIME FARMER.

YOUR FORTUNE FOR 1913

The desire is universal, as we stand on the threshold of a new year, to know something of the fate and fortune that await us in the twelve months ahead. That man who could foretell the events of the coming year and could see in advance the pathway we shall later tread, would be able to bestow a prize benefaction on the human race.

But as yet, in spite of all the advance made in occult science, it is not given to any one of us to penetrate the veil of the future. For some reason, doubtless most wise, we are compelled to walk on without knowing on the evening of one day what shall transpire on the morning of the next.

Still, it is possible by the recognition of certain underlying laws in the moral universe, to be able to predict more or less definitely the character of the coming year. Without being any kind of occult seer or professed fortune-teller or reader of closed secrets, one may predict with fine certainty concerning the future, reading the sequel of the chapter of life that opens on New Year's day.

It is time we realized that fortune is no mere matter of chance. Indeed, there is no chance. All things are but the inevitable working out of primary causes which are in every case at our control. Chance, luck, fortune, fate, exist only as names. Everything is to be commanded. Luck is only the sequence of stalwart and brave effort Chance is but the result, whose connection with the cause is not perceivable. And fate is something ordained, by ourselves.

Wise is that man who in the opening of the new year realizes that he is its master. Not unless he so chooses will he be made a pawn upon the chessboard of life, to be moved hither and thither by the influence that chance to play upon it and him. If he is swept off the board by any influence seemingly stronger than himself, it will be because he has permitted his own power to lie dormant and has not excercised the full forces that are inherent in himf

Its weal or woe will be but the result of the willing, wise or unwise, of this present time. Next December will but fill the order placed in January by each one of us. The year will give back to each man only what he, in purpose and determination, puts into it. It is now simply an unmarked sheet upon which each man may trace the lines of beauty or mar by his careless touch.

To understand the laws of life is to become master of one's fate. To know what causes will result ultimately in failure and sorrow. A man desired is to hold the key to the fortune of the future. Without holding this key one may knock the futile hand upon the locked gate of fortune. With this key it swings open before each of us, admitting to the greatest good and fairest fortune that life can have in store for us.

The one law, perhaps, that needs to be written large and clear is that he who gives, gains. Social isolation is social suicide. To keep one's self apart, not sharing one's joy and optimism with his fellows, is to adopt a course which must result ultimately in fai,ure and sorrow. A man can no more possess happiness for himself than he can catch and hold the sunshine in his closed fist or keep a plant alive under a glass dome.

The pe(sonal benefits of 1913 will depend almost entirely upon the benefactions we bestow. Who locks up, loses. Who divides his treasure, multiplies his pleasures. Who gives away, gets in return and with good interest. In the realm of ethics the usual arithmetical tables are turned topsy turvy but to our eternal advantage.

Another law to remember is that inspiration comes of an ideal. The new year will be as good to us as is the ideal for which we still struggle. Everything will be worth while, or worth enduring, if by it we are enabled to approach a little nearer to the high goal. Everything depends upon the largeness of purpose. All else will be magnified pr diminished in accordance with it. A man is willing to endure hardship or struggle against obstacles, or to risk life and fortune, if that for which he struggles is transcendantly great.

Indeed, it may be truly stated that we in Canada, at the beginning of a new year in a new era of national life and action, need a clearer perception of a new ideal which shall be more fully consistent with the splendor of our opportunity and the greatness of our national task. In this year ahead we shall lay the foundations af Canada's greatness or else, by careless building, expose our country to future fal,. Everything depends upon a high ideal of personal life and public attainment and having it so clearly limned before us that we shall not for one instant forget, even amid the heat and haze of political conflict, the glory of its form and the greatness of its claim upon us.

Delighted With Xmas Number

P. E. I., Dec. 28, 1912

Editor Maritime Farmer:

I was delighted with your Christmas Number which contained so many good photos of prominent stockmen's properties and their herds with very interesting articles on their methods of obtaining success in their respective callings. Your report of the Winter Fair Dairy Test was also a most complete and instructive article that should be preserved by all interested parties for future reference and guidance.

Wishing you the compliments of the season and still more prosperous years for the "Farmer," I remain,

Yours sincerely,

W. M. LEA.

GET KNOWLEDGE

The farmer who thinks he knows it all, who believes that farming is a combination of luck, brute strength and awkwardness, can never make any progress, or at least can only make that slow progress which comes from his own hard-earned experience. The farmer who realizes that this is a big world and that agriculture is a great big science and a most comprehensive and far reaching art, cannot be kept down.

The first farmer does all he can to keep himself doRn. Ignorance is weakness; knowledge is power. It is a fearful thing when a farmer does what he can to make himself weak among his fellow men. Yet we know hundreds of farmers who do that very thing. They spend no money, make no effort, to grow in knowledge. They have fat hogs and starved minds.

This is all useless. There is not a farmer in the land who can read but who can educate himself in a short time to understand the best agricultural literature. There are thousands of such farmers today who had only three months' winter schooling a year in a country school for a few years, but they kept their minds bright by constant reading of the best farm papers and books. Today they are strong, successful farmers and leaders of men.

No man gets to this point, however, who thinks he knows more than other men around him. The Good Book says' "In a multitude of counselors there is safety." Nowhere does it say that one man can know it all by himself.

We have too many farmers who have no hunger or thirst for knowledge. They want money bad enough to work like slaves for it in a blind way, but not enough to think, read and study for it. It is just that lack of a desire for better farming knowledge that holds them down, and it always will hold them down. The farmer is no exception to other men. No man ever increased in fortune and estimation of his fellowmen by reason of his lack of knowledge.

By the time this issue of the Maritime Farmer reaches our readers there will be hundreds of our young men in attendance at the N. S. A. C. Short Courses. These young men go there to get knowledge: They belong to the class of farmers who realize that agriculture is a great, big science and far-reaching art.

LET YOUR LIGHT SHINE

On another page of this issue will be found an article on the "Winter Care of Stable Manure" by W. M. Lea, of Prince Edward Island. Mr. Lea gives the gist of his own experiences. He tried and proved several methods until he ascertained which was most suitable for the conditions existing on his farm.

We would like to hear from a great many more of our readers on questions of this kind. We feel assured that the reading of Mr. Lea's article will benefit some of our readers. It may be that an account of your experience might help. Mr. Lea. Let us hear from you occasionally. Give your fellow farmers the benefit of what you have learned by experimenting. Do not hide your light. Let it shine.

The Nova Scotia Farmers' Association will meet this year in Sydney on January 21st and 22nd. We have not received a copy of the programme but feel assured that it will be up to the high standard of other years. Many of the charter members of the association are dead and gone and younger men are taking their places, but the good work carried on by these fathers of agriculture lives after them and no more fitting monument remains to mark their memory than the N. S. A. C. on the hill in Truro.

Tuberculosis is not an imaginary disease or one that you can have in your herd for years without knowing it as some men will argue. Many farmers have found that it is real indeed. Afeter it has become thoroughly established in a herd the financial loss each year would be so great that any profit would be out of the question. It is a disease that no self-respecting man will allow on his place, for it will disgust and dishearten the most enthusiastic breeder, and it is a disease which no man with even the semblance of a conscience would care to pass to his neighbor.

If you have faith, preach it; if you have doubts, bury them; if you have joy, share it; if you have sorrow, bear it. Find the bright side of things and help others to get sight of it also. This is the only and surest way to be cheerful and happy.

The Value of Co-Operation From the Farmers' Standpoint.

There are so many things in which the farmers can co-operate it is hard to tell which is the most important. For instance, we have the co-operative cheese factory and creamery system, and farm implements that are used only for a few days per year such as turnip seeder, manure spreader and even binders and cultivators can be used to advantage by two or more neighbors on small farms. An implement that is wanted in this community and one that being rather expensive for the individual to buy alone, should be got on the co-operative plan is the Clover Huller.

The buying of seed is a great drain on our farmers and could certainly be helped if they would take the trouble to sow clean seed and gather it right and in large enough quantities to sdpply home demands.

Farmers should stand together to look after their rights as do the manufacturers and middlemen. For instance the Governor of New Brunswick sent out a commissioner to inquire into the needs of the farmers and if the farmers had co-operated and asked for cheaper money they certainly would have got it, but no, they seemed perfectly contented to pay six, seven and even eight per cent on money and left it to the opposition leader (a lawyer) to demand it for them.

In Germany they have the Reiffessen banking system of Agricultural Co-operative Credit Societiesf It requires a law passed by the legislature enabling co-operative societies to borrow money for farm improvements for a short time on their collective quantities, at a low rate of interest as the larger manufacturers pay.

If the farmers of New Brunswick were awake to their own needs they certainly would see the advantage of a system such as that and they will as certainly never get what they don't ask for.

Again, the Gov. Report of 1910 laid before the farmers the advantages of under-drainage and where a certain number petitioned for it they would buy the traction ditcher and pay for the underdraining and the farmers would pay it back in small instalments. How many took advantage of that affer? Not one that I ever read or heard of and last year the offer was not repeated.

There are many farmers who do not need to borrow the money and these should co-operate and buy ditcher and tiles and do work together to a great advantage.

Along the shores of New Brunswick, Westmorland County in particular, there is a strip of country from one to two miles from the shore that seems by nature to be made for growing potatoes. In fact, I think we can banter the world for both quality and quantity of tubers. Why are there not more potatoes grown? Certainly not for want of fertilizer as there is no place in Canada where manure is so easily obtained but because the shores are generally as far from the railroad that it necessitates long hauls on the bad fall roads, and we in Botsford and Westmorland parishes must pay freight over two lines of railroad and by the time middlemen's profits are deducted the farmer has very little left.

Now our Government Reports say that Cuba is our best potato market. Why cannot the farmers along our shores co-operate and get a steamer and take the potatoes direct from the farms in scows to steamers and then to market without so much handling? A few farmers could go to look after sales etc. at the others expense and thus cut down commission, I have not taken the trouble to study how loads of produce are registered but cannot see why it could not be done by farmers as well as the larger potato dealers. Then if the farmers wanted fertilizer it could be handled by boat and save long hauls and salesmen's profits.

The same plan could be applied to the buying of feed and seed grain and seed potatoes, which would be bought in larger quantities on the co-operative plan instead of paying out large sums in merchants' and middlemen's profits.

In this part of our country the sheep and cattle are what may be classed as scrubs. Why? Because the farmers will not hold together to produce the same breeds. One year an Ayrshire bull is used. The next a pure-bred Durham and perhaps the next a Jersey will be the only one in a neighborhaod. Although they are each good in their place a mixing such as we have can only be productive of scrubs.

To attract the best buyers a community should turn out a uniform article whether it is beef cattle or those of milking breeds.

One of the crying needs of the farmer to-day is more laborers and why can that not be helped by co-operation. A farmer will get one man from the old country and keep him about a month when he will leave for want of companionship. Now if the farmers would club together and get enough help at once from the old country to be of company one to the other it would help to keep men in the place who could be got for a days work, and by the farmers planning their work right there would be work for several men in each community the year round.

Some may say the helping of one another to do plowing, threshing, harvesting etc. is a great advantage but although it is alright if each will do the right thing by the other, but in most cases the greedy ones get the best of the bargain.

For instance, in threshing one man will work for another and stay at the tail of mill while his work will be returned by a boy or poor man who can only cut bundles or do the other

Above all the farmers should have easier jobs.

more to say in the Government of our country and they never will until they co-operate as one man is very little good alone no matter how large his ideas are.—Prize Essay by Thos. A. Oulton at the Port Elgin Fair.

A Sheep Account.

Editor Maritime Farmer:—

The following is a summary of accounts of receipts and expenditures of a small flock of sheep owned by the writer:

The amounts charged against the sheep for feed may not be correct, but it is above the average charged in accounts of other flocks that are published as correct. However, I do not think the charge is excessive.

I have put nothing to their credit for destroying noxious plants, but will let this go to balance housing in winter which heretofore has not really cost anything as they have only used space that eariier in the season was used for storing other farm products.

As for the amount of percentage profit I will leave that to be figured out by some person more proficient in figures than myself.

In the accounts is given the yearly membership fee to the Agricultural Society through which a start was made in registered stock. There were other advantages derived from this same membership fee but it is all being charged to the sheep.

The registered stock is of the Shropshire breed. The scrubs are also pure.

The terms of the Agricultural Society was that the member bidding in stock should have his money refunded at the end of the year, when the stock was returned to the society to be again sold. So if the stock was returned alive and hearty all the bidder was out was the use of the money for the year.

This has been charged at 6 per cent,

EXPENSES 1910 A. D.

Subscription to the Agricultural Society	$2.00
Interest at 6 per cent. on $13.00 paid the Agricultural Society for sheep	.78
Feed for two ewes one year	4.00
1911. A. D.	
Subscription to Agricultural Society	2.00
Interest at 6 per cent. on $5.00 paid to the Agricultural Society for sheep	.30
Feed for four sheep one year	8.00
1912 A. D.	
Subscription to Agricultural Society	2.00
One Shropshire ewe purchased	5.00
Six long wool lambs bought in 1911 at $3.25 each	19.50
Registering three sheep	2.50
Feed for six ewes for one year	12.00
Total	$58.08

RECEIPTS 1911, A. D.

9½ lbs. wool @ 23 cents per lb.	$2.19
1912, A. D.	
63 lbs. wool @ 06 cents per lb.	10.08
1 lamb @ $5.00	5.00
1 lamb @ $6.00	6.00
1 shearling ram @ $12.00	12.00
1 scrub ewe @ $4.00	4.00
On hand at present 12 ewes	
3 grade lambs @ $4.50 each	13.50
5 scrub ewes @ $4.50 each	22.50
2 pure bred ewes @ $7.00 each	14.00
1 pure bred ewe @ $8.00	8.00
1 pure bred lamb @ $8.00	8.00
Total	$105.27
	58.08
Balance	$47.19

York Co. N. B.

How to Make Agriculture More Practical.

It is an astonishing fact that the very important study of agriculture has been omitted from our common school curriculum. Truly, it is time we are awakening to make it a more practical study. But how can this be accomplished?

First by teaching our teachers to attend schools where they can obtain a fuller knowledge of the subject, by paying better salaries.

Among the schools which are within reach of New Brunswick are: Truro Agricultural College, where short courses are held during vacations, and the Summer School of Science for the Maritime Provinces. Both of these schools do very creditable work.

Every boy and girl should be taught the names, uses and habits of our common trees and shrubs. Also the names, habits and methods of eradication of our noxious weeds. What could be more profitable than an hour or two each week during fall and spring spent in tramping through the fields and woods, gathering leaves, flowers, etc. and enjoying Nature in all her beauty.

The pupils with the assistance of the teacher should press and mount specimens of weeds, leaves, mosses, lichins, etc. They should be encouraged to bring any plant which they cannot name to the school.

Another interesting branch of Nature study work is the study of butterflies, moths, beetles, etc. Would it not be a good plan to make a collection of the insects and mount them for future reference? The pupil should become familiar with the common names, in what way they affect the plants, and method of treating of most common insects. Cocoons FARM

should be gathered, put in cool places, and watched develop in the Spring.

Lastly to make Agriculture more prartical, supply the schools with gardens. Let every child have his or her own plot of land in which seeds are planted. The children will be very glad of the privilege of cultivating it.

They should experiment with different kinds of seeds, fertilizers, and methods of cultivation, taking notes of expenditures and returns, thus gaining valuable information concerning profitable seeds, fertilizers, etc.

The plan of the garden should be worked out during the Winter by the teacher and pupils.

Summing it all up, we must have more efficient teachers, willing pupils and a school garden.

"There is a pleasure in the
pathless woods,
There is rapture on the
lonely shore,
There is society where
none intrudes,
By the deep sea, and
music in its roar."

—Prize Essay by Miss Amy Lamb at the Port Elgin Fair.

Potatoes at the Rate of Four Hundred Bushels Per Acre.

Editor Maritime Farmer:

Enclosed you will find $1.00 for my renewal subscription to The Maritime Farmer. I would not be withaut The Maritime Farmer as I get a great deal of information from it. About two years ago I read in it an article that Mr. C. Fred Fawcett wrote on potato growing. Being interested in that crop I wrote The Maritime Farmer for information and my letter was forwarded to Mr. Fawcett. I cannot say too much in favor of that gentleman for his kindness to me in answering my questions. The first year I tried his methods I raised three hundred and fifteen bushels of potatoes from one acrel By using the best potato fertilizer on the market this year I have beaten that by eighty-five bushels, reaching the 400 mark. I will be only too glad to give any brother farmer any information I can in regard to my experience.

In thses parts the land is somewhat of a heavy clay soil and does not dry out very early in spring. Some of my neighbors seem very anxious to get their potatoes planted first thing in the spring.

In my experience I find the best way to do is to plough my ground in the fall and plough pretty deep, say five to six inches, and in the spring as soon as it is fit to work I give it a through harrowing with disc harrow and let it lay for six or seven days after which I give it another good harrowing and let it lay again another six or seven days when I go at it again. Some may say that by this time it would be too late to plant. This year I did not plant my patatoes until the twentieth of June. I find that by planting too early I get more potato bugs than potatoes. In dealing my way with the land and using ten to twelve hundred pounds commercial fertilizer to the acre I have grown 400 bushels of good potatoes per acre.

HORTICULTURE.

Early Fruit Culture in the Maritime Provinces.

Editor Maritime Farmer:—

A subject which will interest a great many of your readers is that of the early culture of fruit in the Maritime Provinces.

In 1000 A. D. Lief Erikson visited the Acadian Valley and gave to it the name of Vinland because of the various kinds of wild fruit growing there. Many of the old Indian names along the Atlantic coast attest the abundance of various kinds of wild fruits.

To the French we owe the discovery of the adaptability of the soil to fruit growing but to the English we are indebted for the promotion of that culture.

In 1605 De Monts in his removal from St. Croix was delighted with the clusters of wild grapes growing at the base of the limestone cliffs of the St. John river. Sailing un the "French Bay" as he called the Bay of Fundy he says in his narrative of the expedition, "We entered one of the finest harbours I had seen along these coasts in which two hundred vessels might lie in security, the entrance is eight hundred paces broad; then we entered a harbour two leagues long and one braad which I have named Port Royal."

Port Royal must be regarded as the northern settlement of Acadia and to this sheltered valley snugly ensconced between two sheltering mountain ranges must be awarded the distinction of the first experiments in horticulture in tne Maritime Provinces if not the first garden in Canada. For when Champlain came to Canada in 1605 he brought with him some apple shoots from France. These he planted at Port Royal and the little plot of land to this day is known as the "French Garden."

It is difficult to trace the history of this particular branch of agriculture from year to year as it is rarely spoken of in history, probably on account of the continual changes of rulers of Acadia and the almost continual petty wars.

The Jesuit Fathers did much to promote fruit culture in the various parts of New Brunswick, Nova Scotia and Prince Edward Island where they were stationed. They varied the monotony of their work and added luxuries to their scanty tables with the vegetables and fruit grown in their gardens among the pine stumps. They bestowed special care upon the fruit trees they had raised from seedlings brought from France.

They introduced grapes from France which were larger and of a much firmer flavor than the native grapes. To this species belong the various kinds of currents which were probably introduced at the same time.

In 1633 we hear of apples growing along side the Gasuereaux river where they had been planted by the French. In 1664—twenty-nine years after Champlain's death the Abeniki of the East as the Indians called Acadia "the land of the dawn," the raising of fruit had passed beyond the experimental stage and the valleys of the Cornwallis and Annapolis (Port Royal) rivers were fringed with apple trees. Much large and varied fruit being raised proving the adaptability of the soil to fruit culture by the combined efforts of nature and man.

However, it was soon discovered that the fruit culture was limited as the climate was not suited to the growth of the citrous fruits. Apples were more extensively raised than any other fruit because of the hardiness of their nature, the sure crops and the many different ways in which they could be used as a food and were a great boon to health. They also required little attention. But even this fruit though much ahead of that already grown was inferior in quality to the later fruit.

In 1761 Cornwallis was settled by people from New England, they found many apples growing and set out large orchards from the sprouts coming from the roots of the trees. One of these New England settlers, Col. Burbsidge, introduced several new varieties and was one of the first to practise grafting for which purpose the vigorous trees of the French settlement was well adapted. He introduced two new kinds which exist to the present day, these are the Nonpareil and the Golden Russet.

Rev. Dr. Inglis, first Anglican bishop, about the close of the eighteenth century, imported the Yellow Bellefleur from the state of New York. It spread rapidly through the two valleys and is now generally known as the Bishop's Pippin.

About 1812 the Hon. C. R. Prescott went to Cornwallis and devoted his wealth, energy and common sense to the development of apples and pears. He introduced the Golden Pippin the Ribston Pippin and the Blenheim and had in his orchard over one hundred varieties of apples and fifty varieties of pears. In 1828 the Baldwin apple made its appearance

Although the principal orchards were at Annapolis and Tornwallis nearly every inhabitant of every settlement owning land in the Maritime

The Nova Scotia Fruit Growers' Convention

The Nova Scotia Fruit Growers Association will meet this year in the town of Middleton, on January 28th, 29th and 30th.

Identified with the Association are the most successful and practical fruit growers in Nova Scotia—men who are accomplishing results not only for themselves but for generations yet unborn. The fruit growers have built a sure and solid foundation for a superstructure which has already attained magnificent proportions in the eyes of the fruit consuming world. This superstructure is being pushed skyward to completion until capped with the dome of union and co-operation it stands a monument to good fruit, honest packing and a business integrity that will remain firm throughout the ages in the minds of a discriminating class of consumers.

Prof. J. P. Stewart, of the Pennsylvania State College will be with the fruit growers at Middleton and will deliver addresses on "Spraying and Orchard Fertilizers.

The Provincial Entomologist, Dr. Matheson, will read two papers, one on the San Jose Scale and the other on the Brown Tail and Gipsy Moths.

The question of Thinning, Marketing, Co-operation and other subjects of general interest to fruit growers will be discussed by men who have tried and proved the methods which will be recommended.

"A systematic fight against fruit tree pests" is the slogan of the fruit growers and we expect the 1913 meeting at Middleton will be a record breaking muster that will rally around any banner that leads to progress in the advancement of better marketing methods and to the extermination of the fruit growers' foes.

Will you be at Middleton? In numbers there is strength.

Maple Syrup Makers

Enter this Contest

Cut Out This Coupon

THE demand for genuine and high grade goods so enhances the market price of Maple Sugar and Syrup that we have decided to open a competition to educate the consumer who is more familiar wiih the second or third grade article. To attain this result we offer $500 in gold for the best made syrup and sugar.

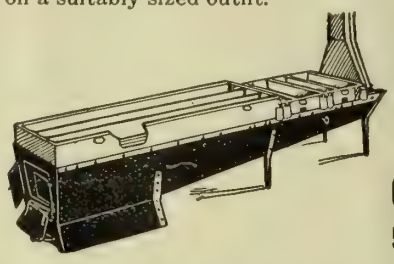
SYRUP AND SUGAR ON EXHIBITION IN MONTREAL

The object of making a display of this kind is to show the public the products of the very best Maple Syrup and Sugar Makers in Canada and must undoubtedly result in unlimited benefit to you should you be one of the exhibitors. All syrup must be made on a Grimm "Champion"—will be judged impartially—must be of a light color to stand a chance of winning a prize—will be paid for if you enter the contest, or returned after contest is over if you so desire.

The entries will be exhibited in the magnificent Show Window of the "Montreal Star."

Why not properly equip yourself to be a WINNER in this contest?

State number of trees you tap, and we will give you price on a suitably sized outfit.



For all conditions and particulars, Address Prize Contest. Don't forget Coupon.

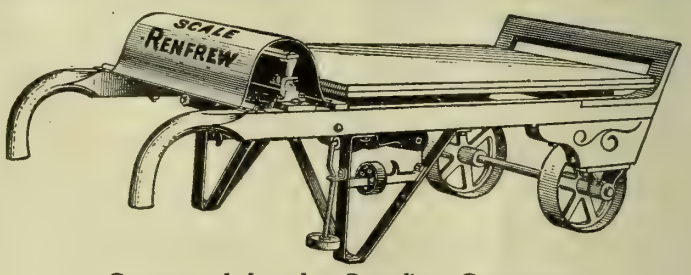
THE FARM SCALE THAT SAVES MONEY FOR FARMERS

THE "RENFREW" HANDY TWO WHEEL TRUCK SCALE



Guaranteed by the Canadian Government

The Renfrew saves every cent of profit for the farmer on everything he sells by weight—because of its absolute accuracy.

It saves for him time and labor,—simply wheel the Renfrew to what you want to weigh.

It saves for him because it is built to last,—and weighs everything from one pound to 2000 pounds.

Does your scale do these things? If not it is time to buy a Renfrew,—the farm scale built to suit your requirements.

MAIL THIS COUPON NOW FOR FREE BOOKLET

Mail Coupon For This Free Booklet—"The Profit in The Last Ounce." It tells interestingly about the business side of farming,—and how money is saved with the Renfrew Handy Two-Wheel Truck Scale.

Provinces had a small orchard set out for home consumption.

From these beginnings have sprung the modern fruit orchards of the Maritime Provinces.—Hazel L. Baxter.

The Culture of Roses.

The rose may well be considered the queen of flowers\ but unfortunately there are many parts of Canada where only a limited number of the hardiest varieties ean be successfully cultivated. For this reason many who would grow roses are debarred from doing so because of a lack of knowledge of which are the most hardy sorts and the treatment that should be given them. To supply this information in ready available form, the Dominion Horticulturist, Mr. W. T. Macoun, has prepared a pamphlet of a dozen pages entitled "Hardy Rose Culture in Canada." It is designated Pamphlet No. 9 of the Experimental Farm and may be had free by applying to the Publications Branch, Department of Agriculture, Ottawa.

This pamphlet divides the roses usually cultivated in Canada into four groups according to the degree of hardiness possessed by each. The hardiest group includes Rosa rugosa and hybrids; Austrian briars, Province or Cabbage roses, Damask roses and Moss roses; next come Hybrid Perpetuals, climbing roses and dwarf Polyantha roses; then Hybrid Tea roses, and last of all Tea roses. It is stated that roses of the first group may be grown in some parts of Canada with little or no protection.

The pamphlet treats in a very practical manner of the culture of roses under the following heads: site and soil, plants and planting, cultivation and watering, manuring, pruning, enemies and how to treat them. Then follow lists of the best varieties of the various classes with a brief winter protection, insects and fungus description of each as regards form, color and fragrance. In the preparation of this treatise the conditions in all parts of Canada were kept in view so that prospective rose growers in every province may receive valuable information from its pages.

Letter From Prof. Caesar.

Guelph, Canada, Nov. 28, 1912.
Mr. Manning K. Ells, Sec. N. S. F. A.
Port Williams, Nova Scotia.

Dear Sir:—I have telegraphed you today in regard to your kind invitation for January 21st, 22nd and 23rd. I am very sorry indeed that a number of things prevent my being able to get away this year. I have always had a desire to meet the Nova Scotia fruit-growers and see the Annapolis Valley as it is very famous as an apple growing district. I should be very glad on some future occasion, if you desire it, to attend some of your meetings and help in any way that I can.

There has been nothing new that I know of in the line of lime-sulphur during this last season except that if it is applied say three or four weeks after the time for the Codling Moth spray on a very hot day it is inclined to produce sun-scald of apples. Again we have found that it cannot be combined with kerosene emulsion or with any substance that contains soap because this tends to break down the sulphur. We have been getting just as good results with the lime-sulphur in the control of Apple Scab even in such years as this as we could with the Bordeaux mixture. However, it is only the people here who give the sprayings at the proper times and make them exceptionally thorough that are getting real clean apples. In most parts of Ontario three thorough sprayings will control Apple Scab. Of these the most important by far is the one just before the blossoms burst and the one right after the blossoms have fallen. I am in favor of wetting epery part of the tree at that time. Most people would consider that it was a waste of spray material but the results that we got from this very thorough and very heavy spraying certainly justify us in urging it upon our fruit-growers. In districts like the St. Lawrence Valley three sprayings will not control Apple Scab in a season like this. Those who failed to put an application on early in August found that no matter how clean their apples were up to that time they became badly scabbed before the end of the season. I do not know your conditions sufficiently well in Nova Scotia Scotia but I should think that a careful inquiry of results in various parts would enable you to discover just what measures would have secured for your clean fruit. I do not believe that there is any reason for losing faith in lime-sulphur as a means of controlling Apple Scab. No mixture could have give more satisfactory results than we obtained in most orchards in Ontario where the work was done properly. Again regretting that I am able to be present at your meeting which I should enjoy very much, I am

Yours sincerely,
L. Caesar.

Canadian Apples Arriving in New Zealand.

This month the character of imports from Canada changes somewhat. Fruit is now coming in. Your Commistioner is pleased to report that apples from British Columbia are arriving in first-class condition. A consignment by the Marama caused great satisfaction. They were examined on the floor of the auction room, and they were certainly a choice lot.

A feature of this shipment of importance is, that a few hundred cases which missed the Zealandia on her last voyage, were placed in cold storage at Vancouver, and remained there until the sailing of the Marama, twenty-eight days afterwards. These apples were in as good a condition as those which came through without delay.

It will be remembered that a number of apple importers of New Zealand were placed in touch with apple exporters of British Columbia some time ago. The result is that the demand exceeds the available supply. There is ample opportunity for other shippers to enter this trade. During a certain period of the year, say three months—October, November and December, if Vancouver can supply the fruit, the buyers here will do most of their business with Canada. There are several large fruit importers whose orders would be regular and substantial. The British Columbia apple has certainly become very popular here.

PEACH EXPERIMENT POSTPONED.

In consequence of the failure to connect with the Zealandia, the trial shipment of peaches did not arrive. It is to be regretted that this experi' ment of shipping peaches to New Zealand must be postponed for another season. The experience of the past two seasons has demonstrated that New Zealand will be a constant and increasing market for British Columbia fruit. When the suggestion was first made to the exporter to send a trial shipment on consignment, there was some hesitation to do so. Now the prices realired are so satisfactory that the shipper is just as eager to send on consignment as he was formerly to sell outright. This is the best evidence which can be advanced as to the quality of the goods.

Mature your crop early

HOW?

The market gardener gets the top of the market for early produce, and the general farmer saves many dollars from early frosts by using a **soluble,** high-grade complete fertilizer, like one of our Stockbridge manures. There is no mystery about it. A crop, like a calf, will grow quicker and healthier on a full ration, **but the ration must be right.** The

Stockbridge Manures

offer this sort of ration for crops.

The Stockbridge Manures were formulated by the late Professor Stockbridge of the Massachusetts Agricultural College and were introduced forty years ago. They have been improved and kept up-to-date. The Stockbridge and all the other Bowker brands are soluble, active, sure. They are made from the best materials by special factory methods. Prompt service and moderate prices go with them.

We want Agents in unoccupied territory. Write today for prices and terms; this may mean a good business for you if your act at once.

Write anyway for our illustrated catalogue and calendar. We want you to know what we can do before you buy your spring fertilizer.

BOWKER FERTILIZER COMPANY

76 Lyman Street, Buffalo, N. Y. 42 Chatham Street, Boston, Mass.

Original and largest manufacturers of special fertilizers.

British Apple Trade.

The Canadian High Commissioner reports that the frequency with which letters and special articles appear in the daily and weekly press on the subject of the English apple, may be taken as evidence of the growing interest which is being taken in the effort to improve the quality of the fruit and to market it in a more attractive manner.

Associations have been found and others are in contemplation, for the purpose of promoting the more general growth of the apple on scientific lines, and with a view to advising growers as to varieties best suited to different districts, and instructing and helping the members in regard to packing and marketing. Each year is showing some improvement, and the most progressive growers are now packing the choicest of their fruit in boxes.

ments were made a few weeks ago to

It was in this way their consign- South America and Cape Colony. Some of the shipments are reported to have arrived in good order but others were not so satisfactory, probably owing to defective cold storage on the ship.

The fruit brokers state that the Nova Scotia apples which are now arriving in London are, speaking generally, good both as to quality and condition, but that prices are not so satisfactory (14s. to 18s. per barrel), the reason suggested being the large quantity of English apples still on store, however, the actual quotations the market. At a large west end are as follows:—

Barrels—

Kings	19s. 6d. to 21s.
Wellingtons	24s. 6d.
Newtons	37sf 6d.
King Tompkins	21s.
Ribstons	28s.

Boxes (British Columbia)—

Newton Pippins	13s. 6d.
Baldwins	12s. 6d.
Winter Banana	16s. 6d.
Cox's Orange	20s. 6d.
Ribston	12s. 6d.
Jonathan	13s. 6d.

It may be noted that there is now no interregnum between the various apple seasons, the Australian, with the aid of the cold stores, having this year extended their season well beyond the time when the English apples came in, Australian Jonathans in excellent condition and of the fine appearance and flavor being on sale as late as October.—Trade and Commerse Report, Dec. 30, 1911.

DAIRYING.

Buying Feed for the Dairy Cow.

On the farm where the winter milk production is given special study and attention, the buyiag of supplemental grain foods is one of the most important factors in determining the profits from the business. It is the largest item of expense. The general adoption of various kinds of commercial by-product feedstuffs as a source of protein has greatly complicated the feeding problem, and increased the danger of injuring the animals by improper methods of feeding. There are many brands of dairy feeds on the market, varying in price from $25 to $40 a ton. Some are good and some are bad. Many dairymen have no real knowledge of feed stuffs, and are likely to buy an inferior brand that is cheap in preference to a high-class product. It is not always ton price, which would be bad enough, but bulk rather than kind or quality of nutrient that guides in the purchase. A much larger quantity of the ready mixed feeds, guaranteed to meet all conditions of feeding, are bought rather than those standard by-products which result from the manufacture of oils, sugar and starch and which are much richer in digestible protein than the original grains, and serve to directly supplement the home-grown feeds. Not only is this much so, but the situation in many dairying communities shows that buyers are paying nearly as much for a ton of feedstuff that carries from 10 to 15 per cent of protein and much more of crude fibre, as they do for feeding materials contaiaing 20 to 40 per cent of protein and a low percentage of crude fiber.

Feedstuffs of low protein and high fiber content are not always unwholesome, nor are they always unprofitable where winter roughage is scarce and high in price; however, they are sure to be made up, in large measure, from bulky by-products which could not be sold under their true names, but when skillfully mixed with more or less of the highly concentrated protein feeds, make mixtures that are palatable and digestible. The point is, however, that in buying such feeds, even when free from dangerous substances, the buyer obtains large quantities of substances which he does not need to enable him to derive the maximum benefits from his home-grown feeds. We make a mistake when we invest in these high-priced feedstuffs when we have already on our farms an excess of a large proportion of the food nutrients which they contain.

The dairyman who wishes to buy a feeding material to supplement his home-grown supply should first of all understand the character of any material to which his attention is called and not depend upon the manufacturer or dealer for this information. A good dairy feed depends as much upon the quality of the grains and by-products as it does upon the amount of food nutrients it contains. All materials in a mixed feed should be of the best quality.

Owing to the high prices of oats and corn, together with the advice from the chemists of experiment stations, farmers have wasted a vast amount of money by selling their good grains and paying a much higher price per ton for manufactured feeds that were less valuable. The only safe plan is to buy no feeds whose chemical composition and origin cannot be correctly ascertained. Honest manufacturers are glad to impart this information and your experiment station will be glad to assist you in determining its accuracy.

While it is very important that buyers of feed stuffs should have an knowledge of the percentages of protein and fat in such materials yet this knowledge does not always show their real character and value. It is possible to make up a feedstuff by the use of hominy, oat-hulls, corn and cottonseed meal that appears to be of high value as measured by the percentages of protein and fat, that is really of inferior value because it contains an excess of highly indigestible fiber. It is for this reason that buyers of dairy foods should not rely entirely upon the guarantees of protein and fat. One of the most significant facts in this connection is that a large number of feedstuffs now on the market are compounded for the purpose of mixing some cheap and bulky ingredient in order that it may be sold at grain prices when otherwise it would be unmarketab,e.

The surest way of detecting inferior ingredients in feedstuffs is by a microscopic study of the various mixtures. In this way an excess of oat-hulls, the presence of corn cobs, weed seeds and other ingredients may be ascertained. Special examinations made of various feedstuffs in New York showed ten brands of wheat by-products adulterated with ground corn cob. Ground cob is not easily detected by an untrained eye and in this way many buyers are paying grain prices for a mixture that contains as high as 500 pounds of ground cob in each ton.

Ground alfalfa is a prominent constituent in many mixed feeds. In some cases it is accompanied by cracked corn, ground oats and other feeding materials. In some brands nothing else but molasses and common salt is present. Ground alfalfa is a valuable feedstuff; however, it cannot be properly classed as a grain food and sold at grain prices. Dealers who buy alfalfa at hay prices and sell it at grain profits are making large profits.

From a study of the chemical composition of some of the popular brands of mixed feeds one is greatly impressed with the grand work a few of the feed manipulators are doing to assist in working out the problem of conserving our natural resources; however, their efforts are not always in harmony with the teaching of the good book. Because farmers waste large quantities of straw, cornstalks and weed seeds it does not necessarily follow that these philosophic gentlemen should be licensed to add such harmful substances as ripe hulls, peanut and coffee shucks, corn cobs and weed seeds to their grain mixtures and sell them for sound grain prices. If the presence of such materials were clearly stated no charge of dishonesty could be made to hold against the manufacturer. In such cases the buyer would be to blame, because if he were willing to pay grain prices for such materials he himself would be responsible. However, the bulk of these feeds are purchased by unsuspecting dairymen who are really least able to stand the financial losses entailed by their use.

Some of the molasses feeds now prominent in our markets would be excellent feedstuffs if the materials were always of the best grade, but the writer has lived within a few miles of several firms who buy elevator sweepings and by-products from breakfast food plants for from $10 to $14 per ton; after manipulating these waste feeds and giving them some high sounding name they are sold to the consumer at prices approaching $25 to $30 per ton. Buckwheat hulls, a worthless feeding material, are now appearing in molasses feeds. The presence of a little sweetening to add palatability does not add any unusual or superlative properties, nor does it make up for the presence of inferior materials.

There are so many feeds of varying value on the market that the prudent buyer must now purchase them only ue,
on the basis of their real feeding value, always keeping in mind that a high-priced feed that is rich in digestible substances is a better investment than a cheaper feed that is made up of woody, indigestible, fibrous hulls and trash.

Cows vary more in the amount of grain they will consume than in the amount of roughage. The idea is to get a cow to eat only what grain she is capable of handling at a profit.—Successfhl Farming.

Mr. Dairyman in Account With Mr. Farmer.

The dairy farmer should be a farmer as well as a dairyman. The growing of feed crops belongs to the farm, and these crops should be grown at a profit, and sold to Mr. Dairyman as a special market.

Mr. Farmer who produces feed-crops is entitled to a reasonable profit as a farmer. The farm must have its profits for producing the raw materials.

Mr. Dairyman is a manufacturer. His business is to take the raw products from Mr. Farmer and convert them into milk, butter and cheese and unless he can show a reasonable profit, after paying a reasonable price for the raw material, and the expense of operating his plant, he is not making a success as a manufacturer.

NOVA SCOTIA FARMERS'
ASSOCIATION
THE SEVENTEENTH ANNUAL CONVENTION will be held at
Sydney, C. B.
JANUARY 21st & 22nd, 1913

An unusually attractive programme is being prepared and vital matters relating to the advancement of Agriculture and Rural Life will be discussed.

Delegates and others going by No. 17 train (I. C. R.) which leaves Truro at 8.30 p.m. Monday, January, 20th, will be in time for the opening session. They should pay one First Class Single Fare to Sydney and ask Agent at Starting point for a Standard Certificate which when signed by me will entitle bearer to return ticket, free.

The Standard

Remarkable Skimming Records Reported by Eastern Dairy School

CANADIAN Dairymen look upon The Eastern Dairy School at Kingston with great respect, and know that the School's reports are always accurate and reliable. One of the late reports of the School is of great interest to dairymen as it shows some remarkable skimming records made by The STANDARD Cream Separator.

Test No. 1 (printed on right side of ad) shows that the No. 4 STANDARD skimmed at the rate of over 520 lbs. although listed at only 450 lbs. capacity of milk per hour. Not only skimmed at nearly 100 lbs. over its rated capacity, mind you, but skimmed down to .025 per cent., which represents the loss of but 1-4 lb. of butter fat in 1,000 lbs. of milk.

Other makes of separators, skimming at their listed capacity, average about .10 per cent., which represents the loss of 1 lb. of butter fat in 1,000 lbs. of milk. The STANDARD, skimming at away over its listed capacity, saves 3-4 of a lb. more butter fat in every 1,000 lbs. of milk.

Test No. 1 therefore goes to show that the owner of a STANDARD 450-lb. machine could open it up to skim 550 lbs. per hour and still do equally as good or better work than any other separator running at only its listed capacity or less. In other words, if you would be satisfied with the skimming that ordinary machines do, a 450-STANDARD will skim equally as much as any other 550-lb. machine, and will give as good or better results.

Standard

But if you desire to skim more closely than an ordinary separator will do, just run the STANDARD at its listed capacity as it comes from the factory. You will then secure results such as shown in Tests Nos. 2 and 3 at right, which results cannot be secured by any other separator. Running on the basis of Tests Nos. 2 and 3 you will be making with an ordinary herd of cows an extra profit (as compared with other separators) of almost enough to pay for the STANDARD in two years' time, or an extra profit (as compared with deep-setting or pan-skimming) of sufficient to pay for the STANDARD in one year.

The STANDARD is indeed "The World's Greatest Separator." And the machine you will select if you go into the separator question thoroughly and buy a machine solely on its merits.

Let us send you booklets containing further records of STANDARD tests and proofs of its superiority. Send us your name and address today.

TESTS OF STANDARD
Size No. 4 Listed Capacity, 450 lbs.

Test No. 1 April 23rd

Minutes running	23
Temp. of milk	90 deg. Fahr.
Lbs. of milk seperated	200
Per cent. of butter fat in skimmed milk	.025
Per cent. of butter fat in cream	27.5

Test No. 2 April 24th

Minutes running	25
Temp. of milk	90 deg. Fahr.
Lbs. of milk separated	200
Per cent. of butter fat in skimmed milk	.01
Per cent. of butter fat in cream	39

Per cent. of butter fat in skimmed milk	.01
Per cent. of butter fat in cream	41

The Renfrew Machinery Co., Limited

Head Office and Factory, RENFREW, Ont. Sales Branches, Winnipeg, Man., SUSSEX, N. B.

The primary function of the farm is to raise the feed to supply the manufacturer with the raw materials to manufacture into finished products.

There are many times when Mr. Farmer, who furnishes the raw material, and Mr. Dairyman, who manufactures the finished products, should get together, compare accounts and do a little reasoning about the next year's business.

Mr. Farmer may have a field that will yield 400 bushels of oats that will be worth $160 to Mr. Dairyman to run through his manufacturing plant and convert into milk, butter and cheese. On the other hand, this same field, is planted to potatoes will yield 1,200 bushels that will sell for $800. Mr. Farmer would be $640 ahead, to say to Mr. Dairyman.

"You take $160 and buy your feed, and I will plant my field of potatoes. I cannot afford to grow oats for you this year."

The whole science of successful hairy farming consists of growing crops at less cost than they will sell for in the market, and then feeding them to cattle that are capable of turning them into finished products that will yield a manufacturer's profit, and thus making two profits; one for Mr. Farmer and one for Mr. Dairyman.

As a class, dairy farmers are raising feed-crops at less cost than their average selling price, and could they all be sold directly after harvest, they would, in most instances, pay a handsome margin over the cost of production. But when they come to manufacture these crops into dairy products on the farm, so that they will have the valuable by-products from their manufacturing business to maintain the fertility of their land, instead of realizing an additional profit from their manufacturing business they find the balance on the wrong side of the ledger, if they keep one.

Too many support their cows from the farm, instead of making the cows support them. Every dairy farmer should keep a record of his farming, as well as of his dairying, to determine whether he is making money from his crop growing or dairying. It would be of great assistance in search ing out leaks and putting the business on a sound money basis.—W. Milton Kelly.

Buttermakers Difficulties.

Sleepy cream is a trouble which the buttermaker has to deal with more in winter than at other times of the year. Cream is termed "sleepy" when it fails to yield up its fat as butter, or only does so with some difficulty. If the various causes of cream going sleepy are known, the trouble can be eliminated to a great extent. In the first place, it is desirable to properly ripen the cream, and regulate it to the correct consistence and temperature before churning. Sweet or sweet and ripened cream mixed is more liable to go sleepy than is cream which has soured uniformly, to the extent that it contains from 5 to 6 per cent. of acid.

If the churning temperature is too low, which is sometimes the case in winter, the cream becomes viscid. This causes it to adhere to the churn, and then, of course, it does not receive the necessary concussion to turn cream to butter. When the cream is too warm at the time of churning, it may swell and froth to such an extent that proper churning is out of the question. Another cause of cream going sleepy is having too much cream in the churn at a time. If the churn is much more than a third fall, it will probably make the cream go sleepy, and it is better to churn the cream in two lots than to over-fill the churn.

When the cream is too thick, it sticks to the sides of the churn, and, after churning for about ten minutes, the cream will be found to be sleepy, on account of not receiving the necessary concussion to convert it into butter.

Cream contains several gases, which are liberated when the process of churning is commenced. If these gases are retained in the churn, the cream froths and becomes sleepy. The cause of sleepy cream can be avoided by keeping the churn well ventilated, especially during the commencement of churning.

When sleepy cream is not due to some fault in the treatment, or churning of the cream, the trouble will appear from time to time throughout the year. Sometimes sleepy cream is caused by an abnormal condition of the milk, which often takes place in early spring and autumn, when the cow's food is subjected to a sudden change. When the cows are first turned out on fresh grass in the spring, and in winter, when the stall foods are changed too suddealy, it causes the cream to go sleepy.

When cows are stale in milk the fat globules are very small in size, and this makes the cream very difficult to churn. In this case one or two newly-calved cows in the herd will remedy matters to a great extent.

If the trouble of sleepy cream exists through no fault of the butter-maker it may be overcome by scalding the cream to 160 degs. F., and then ripening the cream with some pure culture starter keeping the cream at a temperature of 62 to 65 degs. F.—C. W. Walker-Tisdale.

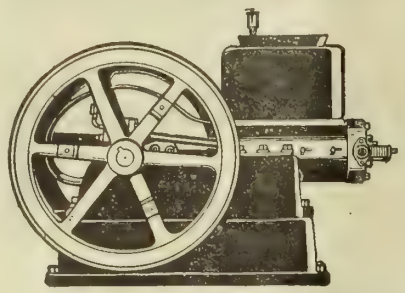
Turnip Flavor in Butter.

A good way to prevent the taint of swedes or turnips appearing in butter is to scald the cream a couple of days before churning. This is doae by putting the cream vessel into a furnace of boiling water, and allowing it to remain there until the cream reaches a temperature of 170 deg. F. The cream must be frequently stirred during tae process, or the sides and top will be many degrees warmer than the interior. When the cream is removed from the furnace, it should be passed through a strainer, and then be put in a place where dust and dirt cannot get in, for scalded cream does not strain easily after it gets cool. But it is a mistake to give everything to the cows which comes out af a root field, as many do. Roots which have been forced too fast by abundant dressings of artificial manure are often decaying when they are brought into the cow shed, and food of this kind is not suitable for milch cows. Decayed leaves, too, are sure to taint the butter worse than wholesome roots alone. But if sound swedes alone are given in moderate quantities, the milk supply will be maintained, and if the cream be scalded as above directed, there need be no fear of taint. —Staffs, in Farm and Home, England.

If you pay as much attention to your advertising as to your bank balance, you will soon be doing better advertising and the bank balance will take care of itself.—Standard Advertising.

A good soft bed is as much appreciated by the cow as by the cow's owner.

GILSON ENGINE "GOES LIKE SIXTY"



Anybody can operate the simple "GOES LIKE SIXTY" Engine. Ready for work the moment you get it. Built strong and solid to last a lifetime. Will give long, unfailing satisfaction. Gas, gasoline or kerosene can be used for fuel.

Gilson quality gives full value for your money—dependable service, great durability, highest economy and perfect satisfaction; freedom from trouble, delays and expense.

Every engine ABSOLUTELY GUARANTEED. You can try this engine on your own farm before settling for it. You take no chances.

The "GOES LIKE SIXTY" Line has an engine for every purpose. All styles and sizes from 1 to 40 h.p.

LIVE STOCK.

Summary of Winter Fair Dairy Test.

The number of cows entered in the Ontario Provincial Winter Fair Dairy Test at Guelph in December was 59 as comapred with 90 at the Maritime Winter Fair, at Amherst.

The sweepstakes cow at Amherst was the purebred Ayrshire cow, Milkmaid 7th, owned by A. McRae & Sons, of Price Edward Island, having produced 188 lbs. milk containing 7.73 lbs. butter fat in three days.

The sweepstakes cow at Guelph was the grade Holstein cow, Cherry, owned by Mr. Geo. E. Ryan, Courtland, Ont., who sold her and his first prize three-year-old grade cow for $320.00. Cherry produced 206.6 lbs. of milk containing 7.85 lbs. of butter fat in three days. Cherry's mother was a good average milker of nondescript breeding, but her sire was a purebred Holstein.

At Amherst: The highest scoring purebred Holstein was Samuel Dickie's Artis Rosia, shown in the aged cow class, with a record of 223.1 lbs. milk and 6.71 lbs. butter fat in three days.

The highest scoring Guernsey was Hugh A. Dickson's Beauty's Bell in the aged cow class with a record of 144.9 lns. milk and 7.69 lbs. butter fat in three days.

The highest scoring Jersey was H. S. Pipes & Sons' three-year-old Bonnie Blue with a record of 138.4 lbs. milk and 6.40 lbs. butter fat.

The highest scoring Shorthorn was Geo. M. Holmes' Miss Amherst, in the aged cow class, with a record of 127.8 lbs. milk and 4.09 lbs. butter fat.

The highest scoring grade cow was Fowler Bros.' Mary, a Holstein Grade shown in the aged cow class. Her record was 206.2 lbs. milk and 7.52 lbs. butter fat, just .4 lbs. milk and .31 lbs. butter fat less than the record of the Ontario champion.

The highest scoring three-year-old cow was F. S. Black's Ayrshire Neta. Record 160.1 lbs. milk and 6.65 lbs. butter fat.

The highest scoring two-year-old was H. S. Pipes & Sons' Jersey Blood's Choice. Record 121.0 lbs. of milk, 6.31 lbs. of butter fat.

The highest scoring one-year-old was Logan Bros.' Holstein, Island Lassie. Record 112.6 lbs. milk and 4.28 lbs. butter fat.

Dickie's aged Holstein cow produced the most milk 263.1 lbs. and the most solids not fat, 18.41 lbs.

McRae's aged Ayrshire produced the most butter fat 7.73 lbs.

The highest butter fat test for one individual milking was 7.6 per cent. made by Roper Bros.' Guernsey, Beauty of Eastview.

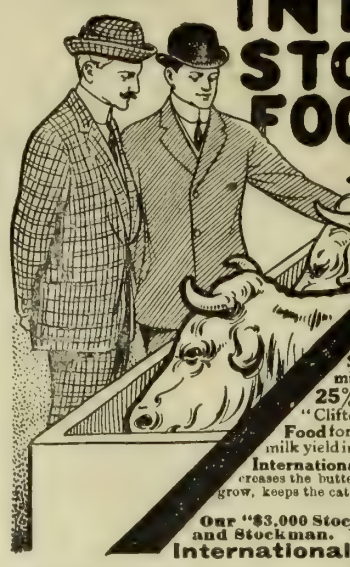
Pig Reply.

Castrating Pigs.—Could you give me a few hints on the right way of castrating young pigs? Are there books on the subject?— Constant Reader.

The best plan is to have a practical demonstration, either by carefully watching the methods employed by an expert in operating or arranging for a special lesson. This will be of more use to you than a page of written description, for, although the castration of the pig is exceedingly simple, and presents no difficulty to a person of ordinary aptitude, it is not possible to describe it minutely without the use of technical terms. From four to six weeks, while the pigs are still with the sow, is the best age for castration, and the operation should preferably be performed in the morning, before the pigs have been fed. The sow should be turned out of the pen, shut up some distance away if vicious or inclined to be nasty, since sows are very much upset when their pigs begin to squeal, which they do even more vigorously while being caught and held than during the operation, which an expert will get through in less than a minute. An assistant is needed to catch and help hold the pigs. There are several methods of holding pigs for castration, the most common being for the operator to thrust the pig handed to him by the assistant between his legs head downwards and abdomen forward, grasping it securely with his knees at the shoulders. The assistant holds the hind legs, with the hocks bent, and keeping them apart and backwards, which exposes the region to be operated on, the operator then pushes the testes up towards the anus, so that the skin is tightly stretched over them, and makes two bold incisions, when they pop out, and then, having freed them from their membranes by a process of twisting and drawing, each cord and artery is broken. The pig is then released by putting it outside the pen with any gilts that may have been captured, so as not to be hunted about in the business of securing other young boars. When all have been finished, the sow should be allowed to rejoin her offspring, and given her breakfast. The knife used should be surgically clean and sharp. There are no books devoted specially to the castration of pigs; the subject is not big enough for a book.

Winter Feeding for Stock.

It is said that there is four times as much animal sickness in winter and early spring as there is in summer and autumn. There must be a cause for this. What is it? Cold weather has little to do with it, but not much. The change from summer to winter feeding does not necessarily cause illness. The real cause is the change to unnatural rations. To maintain health the system requires albuminoids or flesh-formers, and carbohydreates or heat-formers in cerbohydrates, and the food will not all be digested unless taken into the stomach in the required proportions. An excess of either passes off as waste mattee. If too large a quantity of albuminoids is given, it is apt to create diarrhoea, and, if too much carbohydrates, constipation ensues, for the reason that the carbohydrates produce too much heat, make the animal feverish, and this has a tendency to dry up the juices of the system, and the waste matter becomes dry and difficult of evacuation. Let the stockowner ask what effect a constant diarrhoea or continuous constipation of the bowels would be likely to have upon himself. Human beings are always frightened at either, and set about remedying the difficulty at once lest a worse and perhaps fatal trouble ensue. Either one of these conditions weakens the system, and prepares the way for worse difficulties. Stock are subject to the same physical laws. When spring returns and stock are turned out to pasture, four-fifths of their diseases disappear like magic, and this is because grass of itself is a suitable ration. Animals crave it because they know by in-



INTERNATIONAL STOCK FOOD

THE GREATEST MILK PRODUCER IN THE WORLD

We are going to prove this to you by quoting from letters received from men who have tested this wonderful cattle tonic and know what it will do.

Gave 33⅓% More Milk. T. O. Stewart, the famous breeder of Jerseys, says: "I fed **International Stock Food** to my cows all winter, and the milk yield was at least **two-thirds greater**, and the cows are looking better than ever before."

Extra Gallon Every Day for 10c. a Month. L. J. Koch writes: "A three-year old cow was giving a gallon of milk morning and evening when put on dry feed and one tablespoonful of **International Stock Food** per day. She is now giving two gallons of milk each milking and the milk is 50% richer."

25% Increase in 10 Days. Woods & Murphy, owners of the "Clifton Herd" of Holsteins, state: "We used **International Stock Food** for a cow that was run down and a poor feeder. After 10 days the milk yield increased 25%. It also gave grand results with a 2 year old heifer."

International Stock Food increases milk from 15 per cent. to 25 per cent., increases the butter fat, removes taint from milk, butter and cheese, makes calves grow, keeps the cattle well and vigorous, and saves one-fourth the feed. 77

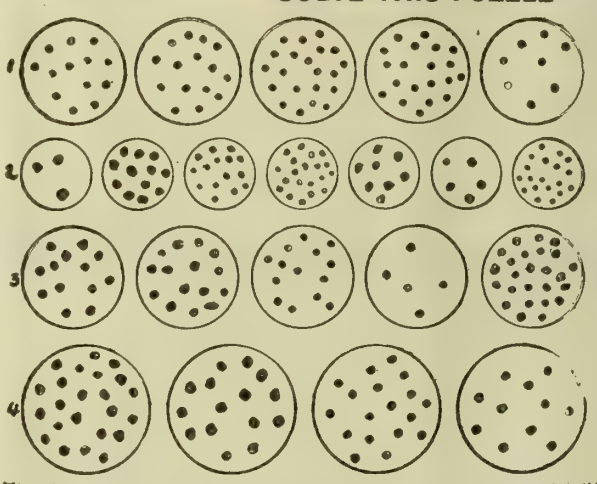
IN THE GREAT DOT PUZZLE CONTEST
A Genuine Contest for WISE HEADS!

SOLVE THIS PUZZLE



1 Something we all have

2 Something we all wear

3 Something we all like to have

4 Something we all do

The above 4 lines of circles containing dots represent the name of 4 different things described after each line. What are they?

HOW TO SOLVE THIS GREAT PUZZLE

Each circle of dots represents 1 letter of the word and the number of dots in each circle determine the letter in its relation to the alphabet. For instance: A is represented by 1 dot because it is the first letter in the alphabet, B is represented by 2 dots because it is the 2nd letter in the alphabet, C is represented by 3 dots because it is the 3rd letter in the alphabet. Now, with these simple instructions and a little patience you can soon have the puzzle solved. To give you a little assistance the 1st letter of the first word is M, because the circle contains 13 dots and M is the 13th letter of the alphabet.

After you have found the solution write your answer neatly on a piece of paper with your name and address and anything else you wish to say about the contest and send it in to us.

Those who send in the Correct or the Nearest Correct Answers; whose answers are the neatest and who live up to the condition of the contest (read rules of contest below), will win the following grand prizes:—

1st	Prize,	$125 00	in cash.	
2nd	"	50.00	"	
3rd	"	25.00	"	
4th	"	15.00	"	
5th	"	Gent's Watch.	Value	$10.00.
6th	"	Ladies' Ring.	Value	$10.00.
7th	"	Fine Clock.	Value	$10.00.
8th	"	44-Piece Dinner Set.	Value	$10.00.

9th Prize, Mission Upholstered Rocker Value $10.00.
10th Prize, Violin. Value $10.00.
11th Prize, Gillette Safety Razor. Value $5.00.
12th Prize, Waterman Fountain Pen Value $5.00.
13th Prize, Glass Water Set. Value $5.00.
14th Prize, Large French Doll. Value $5 00.
15th Prize, Silverware Set. Value $5.00.

READ THE SIMPLE RULES OF THIS CONTEST

1. Contestants may send in as many answers as they wish, but only one answer can win a prize. (2) Only 1 person in each family will be allowed to compete. (3) No employees of ours or any relation of any employee will be allowed to compete. (4) Children under 12 years of age will not be permitted to compete. (5) Write only on one side of the paper. (6) All letters must be fully prepaid in postage. We will not accept answers upon which we will have to pay postage. (7) The decision of the judges must be accepted as final. The judging will be in the hands of 3 gentlemen of integrity who are absolutely disinterested. (8) This contest is absolutely free. You are not asked to spend one cent of your money or buy anything to enter. As soon as we receive your answer we will immediately tell you if you are right, and how the prizes will be distributed. We guarantee the awarding of the prizes described above according to decision of the judges.

Address all answers to **Contest Department. 8220**

NEW LIFE REMEDY COMPANY, TORONTO, ONT.

stinct it is what they need. It is the proper mixture of albuminoids and carbohydrates that the animals crave. Some people wonder that cattle will sometimes prefer dry hay when they have access to all the grass they want. This is because the grass happens to contain a little too much albuminoid matter, and they need the hay to balance the ration.

Pigs and the Bath Tub.

Recently I read an article in one of the farm papers about "Pigs and the Swill Pail," and I want to tell the readers of this pader, about a concrete bathing place that I made for my hogs. It has proved to be one of the best things on the farm.

It is seven feet by twelve feet inside and about twelve inches deep. I used twelve sacks of cement and coarse sand and gravel in the proportion of one to four.

The walls are about four inches above the ground and forms can be made with most any old lumber.

After the bath tub was finished I built a shade over it.

Now I will tell you some of the many advantages to be derived from one of these bathing places during the hot weather. At that time I keep water in it all the time and once a week I put dip in the water to kill the lice. I found this worked successfully and was much easier than dipping the hogs, as the herd, old and young, would go into the water and wallow. They kept the place busy all the time.

I never had hogs to thrive and do better. They got rid of the lice and had a glossy coat of hair.

This winter I used the bath tub to put ashes in, from the furnace and range, always throwing in a few handfuls of salt. Then I bought a ton of coal screenings from our coal dealer for seven cents a hundred and put these in also. The hogs have stayed right by it and have cleaned it all up.

The cost of making (counting material and labor) would not exceed ten dollars and the poorest runt on the place will pay for it. I would not do without mine for ten times its cost.—G. S. Babcock, in Successful Farming .

Why Use Artificial Fertilizers ?

Plants obtain their food from the air and soil, chiefly from the latter. Carbon is obtained from carbon dioxide in the atmosphere. Leguminous plants also obtain Nitrogen from the air but all other classes obtain it from the soil. Water and mineral foods are obtained through the roots from the soil.

The mineral elements, with the exception of Nitrogen, Phosphoric Acid, Potash and sometimes Lime, are in sufficient quantities, in available form, for all crop requirements. Those mentioned however enter more largely into the composition of the plants than the other foods and hence the soil becomes depleted of the foods named in the ordinary process of cropping.

Manure returned to the soil does not, by any means, contain the plant food taken from the soil and, moreover, it loses much of its value through leaking and evaporation. Therefore, unless some other means are found of returning the plant food to the soil the farmer will find that his land is becoming worn out and good crops become rare. This lack of plant food can be remedied by the application of artificial fertilizers. A farmer's soil may be very deficient in Potash—he cannot hope to grow a maxium crop if the land does not contain a sufficient quantity of this essential plant food. Thus, when buying his fertilizer material he should provide for a mixture having a high percentage of Potash. Remember the "substance in minimum rules the crop." You cannot hope to grow a first-class crop if your soil is deficeint of any of these indispensible plant foods.

The rapidly growing consumption of Artificial Fertilizers in Canada proves that farmers are realizing the benefits derived from their use and there is no doubt that each season will see a large increase in the number of consumers.

Expert advice regarding the economic purchase and use of artificial fertilizers will be readily given and copies of our bulletins on the important subject of fertilizing will be sent free on application to German Potash Syndicate, 1105, I. O. F. Temple Bldg., Toronto, Ont.

When you want a reliable medicine for a cough or cold take Chamberlain's Cough Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all dealers.

Pink Sheep.

Almost any one can succeed with sheed in winter time, or in early suring, or in the fall months. Then it is only a question of wisely giving feed in sufficient amounts and of the right sort—things easily enough learned—and the flock will keep in the pink of condition. And, by the way, that phrase, "pink of condition," applies more directly to the sheep than to any other animal, for a healthy sheep is indeed "in the pink," as any one will discover who will part the wool and look at the skin. There is no surer test of condition; the young shephard should learn it, be governed by it in his purchases, and afterwards should learn to determine the state of health or disease if his flock by the appearance of the skin. He need not always catch the sheep in order to learn the color of the skin ; he can tell by the redness of the veins of the eyes, by the color of the nostrils, especially if the sheep is a white-faced one, and a little experience will show him unerringly the state of health of the animal as soon as his eye rests upon it. Unhappy me! I can detect sick sheep as far as I can see them, and Ialways see them.—Excoange.

WHEREVER the old wheelbarrow cleaning system is used you find a mussy stable.

It's too much to expect that a man will brush and sweep the passage ways every time he cleans the stable. He hasn't the time for one thing—and it's discouraging work for another.

But nowadays we think more about clean stables.

We know that dirty stables breed disease.

It's up to you, Mr. Farmer, to make your stable easy to clean — then it will always be clean.

You can learn something about how to do this in Dillon's Book on Clean Stables, which is sent free to Farmers. Dillon's make a Litter Carrier that lightens work about the stable. It's an equipment any man can put up, and is adaptable to stables large or small. The free book explains it fully.

DILLON'S Litter Carrier

Figure it out for yourself. Get our free book.

Dillon's sell direct to the Farmer. There are no Agents and no Agents' profits. The price is the same to all, and lower than you would expect for such substantial and well-built equipment. DILLON'S BOOK ON CLEAN STABLES gives you an exact idea of what you can accomplish for a small outlay. Write for a free copy. 1

THE HORSE.

Only a Horse.

Only a horse, and an old horse too,
working from day to day,
Only a worn-out nag, 'tis true,
plodding his weary way.

A horse that works and works in
vain for his master's word of
praise,
A slave that bows to the tightened
rein; a beast, that the master
flays.

Only a horse; but a horse with a
heart—a thin worn-out old bay;
But with spirit strong, he plods
along with an uncomplaining
neigh.

A beast of burden by man abused,
tortured with lash and with goad;
But a lesson in faithfulness, courage
and toil—this worn-out nag of the
road.

Only a horse—not a brute—but a
horse, a patient, tired old bay.
The brute is the one that applies the
lash, not the one who receives
the flay.

He labors hard for his master's
greed, he endures the toil and the
pain;
But the look of dispair from his eyes
is a prayer—an appeal to be hu-
mane.

Bog Spavin.

Recently W. West wrote concerning a colt said to have "strained his hock by galloping round the field, which has turned out to be bog spavin." "W. W." wanted "all particulars as to treatment," but omitted to mention whether the animal was lame or not. This is a matter of no small importance where treatment is concerned, and has some bearing on the question "Will it leave him in time?,'

CAUSE OF BOG SPAVIN.

So far as external appearance is concerned, bog spavin may be defined as a puffy, fluctuating swelling on the antero-internal aspect of the upper part of the hock joint, where, in a natural state there is a hollow or depression; but there are bog spavins that are associated with inflammation of the true hock joint where nearly all movement takes place, and which occurs from over-work, sprains, rheumatism, etc., and are accompanied by heat, pain, and lameness; and bog spavins arising from an excessive secretion of synovia, from over-exer. tion, or a dropsical effusion into the cavity of the joint, producing a swelling of exactly the same character, but without heat, tenderness, or lameness.

Professor Dick described such bog spavins as "Here stores of synovia for lubricating the joint, thus proving the best preventives of disease by preventing friction," and commenting on this, and pointing out that bog spavin is mostly found in very upright or in very crooked nocks, and in weak hocks of every description, because in all these forms concussion is most severely felt and likely to be injurious, the late professor Williams said. "In all probability the hypersecretion of synovia is due to some irritation not amounting to actual disease, and may be viewed as a provision of Rature to fulfil the purpose ascribed to it by Professor Dick, since it often happens that such hocks remain sound as long as those of better conformation."

A FREQUENT CAUSE OF LAMENESS.

There is no doubt about the correctness of this view of bog spavin, but all the same it is one of the most troublesome canditions of hock, not so much because it is a frequent cause of lameness or often incapacitates the animal for work, but because it worries the sensitive owner because it is a constant eyesore, because it undoubtedly depreciates the commercial value of the animal, and because the treatment for the reduction of the swelling is not attended by any great measure of success. It must, of course, be clearly understood that these remarks apply only to the soft swelling that is more in the natute of a blemish than an unsoundness or cause of lameness, and not to the bog spavin associated with inflammation of the hock joint due to sprain or other injury and accompanied by lameness. Fortunately, it is the least important form as regards the occurrence of incapacitating lameness that is the most commonly met with and but for the eyesore, and the possibility—though this is remote—of its assuming an aggravated form, it would attract very little attention. Bog spavins that are merely dropsical conditions of the articulation are not generally regarded as constituting actual unsoundness, but they certainly depreciate the selling if not the working value of the animal. Bog spavin is a technical unsoundness, since it is a departure from the absurd legal definition that "sound means perfect," and thus no veterinary surgeon would pass as sound a horse with bog spavin without directing the attention of his client to it, and a purchaser, if he detected the enlargement, would be foolish to give as much money for a horse with a bog spavin as if it had clean and well-shaped hocks, although it might last him just as long and do as much work. The period at which bog spavin generally makes its appearance is when the animal is first taken into work or during the breaking-in process. It is sometimes developed while the colt is running in the field, and is then due to galloping or jumping in play or mischief, which are, of course, causes of concussion and strain, and especially likely to occur where there is any defect in conformation. There is no evidence of hereditary transmission, but as bog spavin is frequently associated with mis-shapen or badly formed hocks, this should be borne in mind when selecting aaimals for breeding purposes.

TREATMENT FOR BOG SPAVIN.

With reference to the treatment of bog spavin, we cannot attempt to give " all particulars," for a great deal, of course, depends on the cause, and the existence or otherwise af lameness. To the owner of a horse with a bog spavin of the dropsical variety that does not cause lameness, and especially if he intends to keep it for work, the advice we always give is to let it alone, since the results obtained by treatment are very trouble expended and the expense inrarely in proportion to the time and curred. In cases due to sprain, and where there is heat, tenderness to touch, and lameness, the indications are rest, a high-heeled shoe to throw the parts more completely into a state of rest, and cooling lotions or cold water irrigation, until the lameness—which resembles that of bone spavin, but with a greater tendency to a jerking up of the limb—has somewhat abated, and then the application of a blister and a further rest. Generally the owner of a horse with a bog spavin, even when not lame, wants to blister it with a view of reducing the swelling, but vesication rarely—never in our experience—does anything towards causing absorption of the fluid that is of permanent value. Pressure is sometimes tried in those cases wnere neat and pain are absent, and is often more effective than blistering, but owing to the conformation of the hock joint ordinary bandages are disturbed at every movement of the limb, and pressure can only be effectively applied by means of a specially fitted spring truss. As already hinted, the results are rarely commensurate with the outlay.—Pately Bridge.

Horsemen Attention!

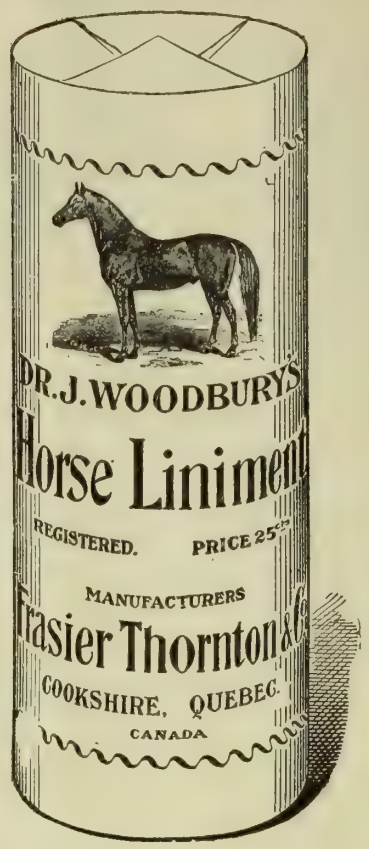
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

Demand

POULTRY.

Where Market Poultry Pays Best.

STEPHEN B. TWINING, the genial proprietor of Afton Farm, Yardley, Pa., believes in the middleman. Notwithstanding that for years the poultry press in general and the poultry shippers in particular have been decrying the commission man, Mr. Twining has found him an excellefit adjunct to his farm operations. In truth, instead of "bleeding" the Afton Farm, he is saving labor and worriment to the management, besides adding considerable to the bank account. There are good and bad middlemen; there is no doubt about it. Before shipments are made to a house, the reliability should be investigated.

Thirty-odd years ago E. W. Twining, the father of the present owner, started in a small way what is now known as the "Afton Farm." From the beginning market poultry was the object, broiler-raising being the branch chiefly catered to. The original plant occupied but an acre of ground.

Mr. Twining not only made a deep study of the work, but he made tests and trials, until he got the plant up to successful operation. It was slow work, but as it progressed it was built upon a solid foundation. It is a noteworthy fact that all the large and successful poultry farms of today are those that had a small beginning, and by dint of energy and perseverance worked their way to the front. Every big, healthy enterprise must come by growth. Rome was not built in an instant.

The wants of the markets of Boston, New York, Atlantic City, Philadelphia and Washington were duly investigated and their whims strictly catered to. In this way Afton Farm became a paying proposition. In a great measure the success of Afton farm was due to the superior line of breeding stock that had been developed there. The birds were vigorous, had large, well-shaped bodies, set on short, stout legs, which were far apart; birds that were heavy layers and producers of the blocky, broad-breasted youngsters that dress so nicely for market and command fancy prices from the leading butchers.

Visitors usually wanted to procure some of this stock, and Mr. Twining got to sparing a little; later on he found it necessary to provide for this trade, and finding this branch of the business worth his while, he started in 1907 to advertise the stock. Up to the present time a large business has been established in the sale of breeders and eggs for hatching. But, with it all, Mr. Twinging is seriously considering going back to market goods exclusively. He says there is less clerical work, less worriment, and, in all, more profit.

The experience of Afton Farm has been that there is always a demand for good poultry at a price which makes production profitable. The supply of first-grade stock is not increasing in proportion to the demand. The market always has had, and probably always will have, a surfeit of cull stock, for the reason that people will persist in breeding from inferior birds. There is no good logic in it—a poor hen cannot be maintained at a less figure than can a good one. Pure-bred stock will not only do better laying as a flock, but will also produce offspring that will more quickly mature and develop the kind of carcasses that command the highest prices in market.

In 1899, having finished his school days, Stephen B. Twining returned home and entered into co-partnership with his father, under the firm name of S. B. & E. W. Twining. January 4, 1906, after a brief illness, the elder Mr. Twining died, and the sole proprietorship and management fell to the son, who is still a young man. Poultry is his life work. He believes that a square deal today means a big advertisement for tomorrow. He has become one of the best informed men in the country on market poultry.

The breeding is done principally for size, growth and heavy egg yield. Over 50,000 birds are annually raised, and only 2,000 pullets are reserved each year. They are, naturally, culled, selected from the flocks, and are the choicest of the lot. The rest—seconds, thirds, etc.—go to care for the large trade of dressed poultry that Afton Farm has acquired. The first year the breeders are used for the market egg trade, and then they are overhauled and mated for the "eggs for hatching" business during this yearling year.

When any business relying upon public support for success can point with pride to an honorable career for many years, it is proof of its sterling merit; for only a business possessing merit can survive in this progressive age. Afton Farm started with poultry in the pioneer days and is here today greater and stronger than ever.

There is nothing mysterious in success with poultry. The methods of successful poultry men are very simple. There are no wonderful secrets—it is merely common sense, which includes common honesty, backed by grit and well-directed energy.

Mr. Twining says: "Success with poultry? You get it the same way that you do with everything else—attending strictly to whatever happens to be in hand and not trust too much to hired help."

The rules that Afton Farm has followed from the start, and which made its career so successful, are:

1. Start with and keep nothing but the best of breeders.
2. Have comfortable houses; this does not necessarily mean expensive.
3. Feed plain, wholesome food.
4. Never use poor feed because it costs less money. It is the most expensive in the long run.
5. Fancy prepared foods, while oftimes good, are expensive and unnecessary.
6. Keep everything clean.
7. Never let it be too much trouble to do the right thing at the right time.
8. Above all things, always exercise just plain, ordinary, common sense.

The duck industry on Afton Farm has come to be one of the most important. Each carcass is banded, giving a trade mark that at once guarantees reliability of stock.

Raising green ducks for market is occupying considerable time on Afton Farm. Mr. Twining says the low prices of 1908, while expensive to the producers of that year have been a boon to the duck business. Heretofore consumers only thought of ducks as birds that were hatched in the spring by the farmers' hens, allowed to wallow in the mud all summer, feed on filth, etc., and then fattened in the fall when old, tough, and of coarse-grained flesh.

Mr. Twining, in his book, "Poultry Truths," says that in the early days it was hard for the producer of green ducklings to get the trade on his goods he deserved. The low price of ducklings in 1908, and the high price of other meats, caused summer resort hotelmen to sit up and take notice. For economy's sake they tried ducklings. Their guests liked them. They were served often. It was a common thing to hear on a hotel porch that summer: "I never thought I would care for duck, but the ducklings they are serving here are delicious."

From these summer hotels the guests went to their homes scattered over the country. They remembered that ducklings were truly good eating. Thus one year's low prices have advertised ducklings throughout the land. A demand has been established that assures good prices for years to come.

This remarkable development of the duck industry in this country was made possible largely through the introduction of the Imperial Pekin. They will lay earlier in the season. They will lay the most eggs per year. They are confined by a two-foot-high fence. They have white feathers. They are quick growers. They have long, low breasts that flesh up well. In fact, Mr. Twining has found in the Pekin the two essentials combined—the cheapest duck to raise and the best table duck.

On Afton Farm not less than 25,000 ducks are raised annually, and as one cent per pound additional cost in production or loss in sale means for the season one thousand dollars lost, Mr. Twining is continually watching for opportunity to reduce the cost of production, or how to get a better price.

Ducks do not require the expensive buildings as do chickens. They are gross eaters, but the cost need not be but a little more than half as much to produce a pound of duck flesh as a pound of chicken.

A man can go in the duck business on a more extensive scale than he can in any other branch of the poultry business, for the reason that he can depend more on hired labor, as there is not the fine labor required for ducks that there is for chickens, guineas or turkeys.

A sandy or a well drained soil is important. Too great care can not be used in the selection of the breeders. The stock should have long, low-hanging keel, with large heads and thick necks. The legs should be heavy and of a rich, reddish orange shade.

Mr. Twining says weakness in the vitality will show up as quickly in a duck's eyes as anywhere. Watch out for weak, watery eyes.

On Afton Farm the ducks are fed for eggs (bulk measurement) one part bran, one part middlings, one part low-grade flour, one part whole corn, two parts whole wheat, two parts corn meal, four parts cut clover hay, 12 per cent. beef scraps, sand, grit and oyster shell, all they will eat. Mix with water till crumbly. Should there be a looseness of the bowels, the amount of middlings is increased, and if too tight, the amount is decreased. The quantity of corn, too, is varied according to the weather. The amount of corn meal is so regulated that it will keep the breeders neither too thin nor too fat. Meat scrap affects the fertility—where too much is used there will be a lot of rotten eggs. If the fertility is low, the amount of beef scrap should be increased.

As a rule, the duck lays between four and eight o'clock in the morning. As ducks do not lay in nests, but drop the eggs anywhere on the floor, they should be gathered promptly at eight or some of them may be broken.

On Afton Farm the ducks are set daily instead of every four days, as used to be the custom. This gives better hatches. Duck eggs will not remain in good condition as long as will hen eggs.

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Toronto, Ont.

Afton Farm believes in bathing water for the breeding ducks. This bathing affords exercise, keeping the stock in better condition, and there is better fertility. The ducklings raised for market are not allowed water excepting for drink. A muddy or dirty duck will not thrive.

When shipped to market all the ducks are dry-picked. Dry-picked ducks bring a cent per pound more than scalded ducks, or five cents per duck. The cost of picking dry is two cents per head over scalding. Thus there is a gain of three cents per head, or $600 a year.

"We, at Afton Farm, are thoroughly convinced that it pays to do things right," says Mr. Twining. "Haste makes waste, we are told. Do your work as rapidly as possible, but take time enough to do it well and at the right time."

At this season of the year green food will be in demand. It may be thought that so long as there is any green vegetation left fowls will not need planted crops. But such is not the case. The native vegetation is apt to be tough and woody. Fowls will not relish grass or native vegetation this late in the season when the weather is dry and frost is near. They should have access to rye, oats, wheat, barley, peanuts, rape, cowpeas, etc. This is a critical time with fowls that are moulting. They should have green food as well as plenty of grain and mash composed of concentrates rich in protein. By taking the proper precautions you may greatly assist the fowls in getting flesh for winter so that they will produce a normal supply of eggs.

In the fall, when roads are deep in dust, take a lot of twenty-five pound paper flour-bags, and strings, hoe and shovel, and gather toad dust for a bath for your hens during the winter. Dump in a tight barrel, and set in a dry corner, and scoop into the wallowing bin as you need it.

125-Egg Incubator and Brooder Both For **$13.75**

If ordered together we send both machines for only $13.75 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Especially adapted to Canadian climate. Incubator and Brooder shipped complete with thermometers, lamps, egg testers—ready to use when you get them. Five year guarantee—30 days trial. Incubators finished in natural colors showing the high grade California Redwood lumber used—not painted to cover inferior material. If you will compare our machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our price of $13.75 is for both Incubator and Brooder and covers freight and duty charges. Send for FREE catalog today, or send in your order and save time.

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

I felt it rather hard, I must own, to be made, without deserving it, the subject of jokes between the coachman and guard as the coach drawing heavy behind, on account of my sitting there, and as the greater expediency of my travelling by waggon. The story of my supposed appetite getting wind among the outside passengers, they were merry upon it likewise; and asked me whether I was going to be paid for, at school, as two brothers or three, and whether I was contracted for, or went upon the regular terms; with other pleasant questions. But the worst of it was, that I knew I should be ashamed to eat anything, when an opportunity offered, and that after a rather light dinner, I should remain hungry all night—for I had left my cakes behind, at the hotel, in my hurry. My apprehensions were realized. When we stopped for supper I couldn't muster courage to take any, though I should have liked it very much, but sat by the fire and said I didn't want anything. This did not save me from more jokes, either; for a husky-voiced gentleman with a rough face, who had been eating out of a sandwich-box nearly all the way, except when he had been drinking out of a bottle, said I was like a boa-constrictor, who took enough at one meal to last him a long time; after which he actually brought a rash out upon himself with boiled beef.

We had started from Yarmouth at three o'clock in the afternoon, and we were due in London about eight next morning. It was Midsummer weather, and the evening was pleasant. When we passed through a village, I pictured to myself what the inside of the houses were like, and what the inhabitants were about and when boys came running after us, and got up behind and swung there for a little way, I wondered whether their fathers were alive, and whether they were happy at home. I had plenty to think of, therefore, besides my mind running continually on the kind of place I was going to—which was an awful speculation. Sometimes, I remember, I resigned myself to thoughts of home and Peggotty; and to endeavoring, in a confused blind way to recall how I had felt, and what sort of boy I used to be, before I bit Mr. Murdstone; which I couldn't satisfy myself about by any means, I seemed to have bitten him in such a remote antiquity.

The night was not so pleasant as the evening, for it got chilly; and being put between two gentlemen (the rough-faced one and another) to prevent my tumbling off the coach, I was nearly smothered by their falling asleep, and completely blocking me up. They squeezed me so hard sometimes, that I could not help crying out, "Oh if you please!"—which they didn't like at all, becahse it woke them. Opposite me was an elderly lady in a great fur cloak, who looked in the dark more like a haystack than a lady, she was wrapped up to such a degree. This lady had a basket with her, and she hadn't known what to do with it, for a long time, until she found that, on account of my legs beshort, it could go underneath me. It cramped and hurt me so, that it made me perfectly miserable; but if I moved in the least, and made a glass that was in the basket rattle against something else (as it was sure to do), she gave me the cruellest poke with her foot, and said, "Come, don't you fidget. Your bones are young enough I'm sure !"

At last the sun rose, and then my companions seemed to sleep easier. The difficulties under which they had laboured all night, and which had found utterance in the most terific gasps and snorts, are not to be conceived. As the sun got higher, their sleep became lighter, and so they gradually one by one awoke. I recollect being very much suprised by the feint everybody made, then, of not having been to sleep at all, and by the uncommon indignation with which every one repelled the charge. I labour under the same kind of astonishment to this day, having invariably observed that of all human weaknesses, the one to which our common nature is the least disposed to confess (I cannot imagine why) is the weakness of having gone to sleep in a coach.

What an amazing place London was to me whea I saw it in the distance, and now I believed all the adventures of all my favorite heroes to be constantly enacting and re-enacting there and how I vaguely made it out in my own mind to be fuller of wonders and wickedness than all the cities of the earth, I need not stop here to relate. We approached it by degrees, and got in due time, to the inn in the Whitechapel district, for which we were bound. I forget whether it was the Blue Bull, or the Blue Boar; but I know it was the Blue something, and and that its likeness was painted up on the back of the coach.

The guard's eye lighted on me as he was getting down, and he said at the booking-office door :

"Is there anybody here for a youngster booked in the name of Murdstone from Bloonderstone, Sooffolk, to be left till called for ?"

Nobody answered.

"Try Copperfield, if you please, sir," said I, looking helplessly down.

"Is there anybody here for a youngster booked in the name of Murdstone from Bloonderstone, Sooffolk, but owning to the name of Copperfield, to be left till called for?" said the guard. "Come! Is there anybody?"

No. There was nobody. I looked anxiously around; but the inquiry made no impression on any of the bystanders, if I except a man in gaiters, with one eye, who suggested that they had better put a brass collar round my neck, and tie me up in the stable.

A ladder was brought, and I got down after the lady, who was like a haystack not daring to stir, until her basket was removed. The coach was clear of passengers by that time, the luggage was very soon cleared out, the horses had been taken out before the luggage, and now the coach itself was wheeled and backed off by some hostlers, out of the way. Still, nobody appeared, to claim the dusty youngster from Blunderstone, Suffolk.

More solitary than Robinsbn Crusoe, who had nobody to look at him, and see that he was solitary, I went into the booking office, and, by invitation of the clerk on duty, passed behind the counter, and sat down on the scale at which they weighed the luggage. Here, as I sat looking at the parcels, packages, and books, a inhaling the smell of stables (ever since associated with that morning), a procession of most tremendous considerations began to march through my mind. Suppose nobody should ever fetch me, how lomg would they consent to keep me there? Would they keep me long enough to spend seven shillings? Should I sleep at night in one of those wooden bins, with the other luggage, and wash myself at the pump in the yard in the morning; or should I be turned out every night, and expected to come again to be left till called for, when the office opened next day? Supposing there was no mistake in the case, and Mr. Murdstone had devised this plan to get rid of me, what should I do? If they allowed me to remain there until my seven shillings were spent, I couldn't hope to remain there when I began to starve. They would obviously be inconvenient and unpleasant to the customers, besides entailing on the Blue Whatever-it-was, the risk of funeral expenses. If I started off at once, and tried to walk back home, how could I ever find my way, how could I ever hope to walk so far, how could I make sure of any one but Peggotty, even if I got back? If I found out the nearest proper authorities, and offered myself to go for a soldier, or a sailor, I was such a little fellow that it was most likely they wouldn't take me in. These thoughts, turned me burning hot, and made me giddy with apprehension and dismay. I was in the height of my fever, when a man entered and whispered to the clerk, who presently slanted me off the scale, and pushed me over to him, as if I were weighed, bought, delivered and paid for.

As I went out of the office, hand in hand with this new acquaintance, I stole a look at him. He was a gaunt, sallow young man, with hollow cheeks, and a chin almost as black as Mr. Murdstone's; but there the likeness ended, for his whiskers were shaved off. and his hair, instead of being glossy, was rusty and dry. He was dressed in a suit of black clothes which was rather rusty and dry too, and rather short in the sleeves and legs; and he had a white neck-kerchief on, that was not over clean. I did not, and do not supuose that this neck-kerchief was all the linen he wore, but it was all he showed or gave any hint of.

"You're the new boy?" he said.

"Yes, sir," I said.

I supposed I was. I didn't know.

"I'm one of the masters at Salem House," he said.

I made him a bow and felt very much overawed. I was so ashamed to allude to a common-place thing like my box, to a scbolar and a master at Salem House, that we had got some little distance from the yard before I had the hardihood to mention it. We turned back, on my humbly insinuating that it might be useful to me hereafter; and he told the clerk that the carrier had instructions to call for it at noon.

"If you please, sir," I said, when we had accomplished about the same distance as before, "is it far?"

"It's down by Blackheath," he said.

"Is that far, sir?" I diffidently asked.

"It's a good step," he said. "We shall go by the stage coach. It's about six miles."

I was so faint and tired, that the idea of holding out for six miles more was too much for me. I took heart to tell him that I had had nothing all night, and that if he would allow me to buy something to eat, I should be very much obliged to him. He appeared susprised at this—I see him stop and look at me now—and after considering for a few moments, said he wanted to call on an old person who lived not far off, and that the best way would be for me to buy some bread, or whatevir I liked best that was wholesome, and make my breakfast at her house, where we could get some milk.

Accordingly we looked in at a baker's window, and after I had made a series of proposals to buy everything that was bilious in the shop, and he had rejected them one by one, we decided in favor of a nice little loaf of brown bread, which cost me threepence. Then, at a grocer's shop, we bought an egg and a slice of streaky bacon, which still left what I thought a good deal of change, out of the second of the bright shillings, and made me consider London a very cheap place. These provisions laid in we went on through a great noise and

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

DANGER PERIOD OF WOMANS' LIFE FROM 45 to 50

Interesting Experience of Two Women—Their Statements Worth Reading.

White Oak, Ont.—"At Change of Life when doctors could do no more and I was

given up by my friends, Lydia E. Pinkham's Vegetable Compound came to the front and did wonders for me. I had been having female troubles for years, my head troubled me severely at times, I had bearing down pains and backache and I was very anaemic from excessive flowing. I recommend your Compound highly and do all I can to advertise it as a genuine woman's medicine." — Mrs. SYLVESTER MANNING, White Oak, Ontario.

The Case of Mrs. Kirlin.

Circleville, Ohio.—"I can truthfully say that I never had anything do me so much good during Change of Life as Lydia E. Pinkham's Vegetable Compound.

"Before I had taken one half a bottle of it I began to feel better, and I have continued taking it. My health is better than it has been for several years. If all women would take it they would escape untold pain and misery at this time of life."—Mrs. ALICE KIRLIN, 358 W. Mill St., Circleville, Ohio.

The Change of Life is one of the most critical periods of a woman's existence. At such times women may rely upon Lydia E. Pinkham's Vegetable Compound.

uproar that confused my weary head beyond description, and over a bridge which, no doubt, was London Bridge (indeed I think he told me so, but I was half asleep) until we came to the poor person's house, which was a part of some alms-house, as I knew by their look, and by an inscription on a stone over the gate, which said they were established for twenty-five poor women.

The Master at Salem House lifted the latch of one of a number of little black doors that were all alike, and had each a little diamond-paned window on one side, and another little diamond-paned window above; and we went into the little house of one of these poor old women; who was blowing to make a little saucepan boil. On seeing the master enter, the old woman stopped with the bellows on her knee, and said something that I thought sounded like "My Charley," but on seeing me come in too, she got up, and rubbing her hands made a confused sort of half curtesy.

"Can you cook this young gentleman's breakfast for him, if you please?" said the Master at Salem House.

"Can I?" said the old woman. "Yes can I, sure!"

"How's Mrs. Fibbitson to-day?" said the Master, looking at another old woman in a large chair by the fire, who was such a bundle of clothes that I feel grateful this hour for not having sat upon her by mistake.

"Ah, she's poorly," said the first old woman. "It's one of her bad days. If the fire was to go out, through any accident, I verily believe she'd go out too, and never come to life again."

As they looked at her, I looked at her also. Although it was a warm day, she seemed to think of nothing but the fire. I fancied she was jealous even of the saucepan on it; and I have reason to know that she took its impressment into the service of boiling my egg and broiling my bacon in dudgeon; for I saw her, with my own discomfited eyes, shake her fist at me once, when these culinary operations were going on, and no one else was looking. The sun streamed in at the little window, but she sat with her own back and the back of the large chair towards it, screening the fire as if she were sedulously keeping it warm, instead of it keeping her warm and watching it in a most distrustful manner. The completion of the preparations for my breakfast, by relieving the fire, gave her such extreme joy that she laughed aloud—and a very unmelodious laugh she had I must say.

I sat down to my brown loaf, my egg, and my rasher of bacon, with a basin of milk besides, and made a delicious meal. While I was yet in the full enjoyment of it, the old woman of the house said tothe Master:

"Have you got your flute with you?"

"Yes," he returned.

"Have a blow at it," said the old woman, coaxingly. "Do!"

The Master, upon this, put his hand underneath the skirts of his coat, and brought out his flute in three pieces, which he screwed together, and began immediately to play. My impression is, after many years of consideration, that there never can have been any who played worse. He made the most dismal sounds I have ever heard produced by any means, natural or artificial. I don't know what the tunes were—if there were such things in the performance at all—which I doubt—but the influence of the strain upon me was, first, to make me think of all my sorrows until I could hardly keep my tears back; then to take away my appetite; and lastly, to make me so sleepy that I couldn't keep my eyes open.

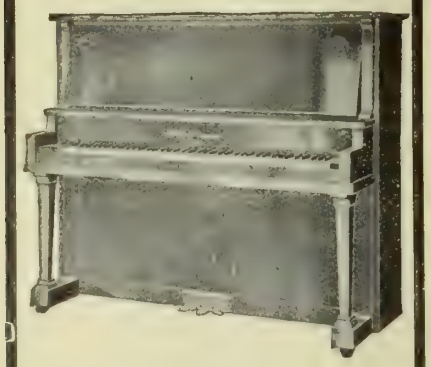
Dr. Morse's Indian Root Pills

are made according to a formula in use nearly a century ago among the Indians, and learned from them by Dr. Morse. Though repeated attempts have been made, by physicians and chemists, it has been found impossible to improve the formula or the pills. Dr. Morse's Indian Root Pills are a household remedy throughout the world for Constipation and all Kidney and Liver troubles. They act promptly and effectively, and 49

Cleanse the System

"Canada's Biggest Piano Value"



Style 70—Colonial

Sherlock-Manning 20th Century Piano

Examine the Sherlock-Manning 20th Century Piano. Listen to its exquisite singing tone. Ask about its many quality features —Otto Higel Double Repeating Action; Poehlmann Wire (the best **imported** piano wire); Weickert Felt Hammers; the famous Billings Brass Flange (the flange that endures); and other important features.

Then, when you've found out all there is to know about the **Sherlock-Manning 20th Century Piano**—when you've been **convinced** that this instrument represents the **best** piano value in the Dominion—then ask us the price. You'll find it much less than you expected.

But there are sound reasons to account for the lower price as for the greater excellence of these splendid instruments.

Write us to-day for full particulars and handsome art catalogue—and we'll tell you how **you can save $100** on the purchase of as fine a piano as can be made at any price. 27

Painful Neatness

I do believe that any women can be a reasonably neat housekeeper without making a bosom companion of the broom, the scrubbing brush and the dust-pan. I believe that cleanliness is next to Godliness, but I do not believe that it is necessary for a woman to clean the same thing on the same day of the week every month in the year just because she has a system to carry out, whether the thing needs cleaning or not. It is not the constant cleaning, but the keeping clean that tells for good housekeeping. One woman may work all the time and her house never looks neat or in order, while another seems to have plenty of leisure for rest and reading and recreation, and yet her rooms are neat and orderly and her house always reasonably clean.

The first will scrub her floors until they shine, and before they are dry she will begin to spill and slop and drizzle dishwater and milk and grease from table to stove, and from stove to pantry, aad the next day her floors need scrubbing again, and so she scrubs them. She will blacken her stove until you could see your lace in it, and then let things boil over while cooking, spill water on the shining surface and let the meat spatter as it fries, until another onslaught with the blacking brush is necessary. When getting a meal, everything she uses is laid down where it is used, instead of being put back in place and when she bakes, the table, stove, door-knobs and dishes all bear the marks of dough, flour, lard and sugar, and so it is necessary that they should all be cleaned, and the daily scrubbing goes merrily on, and this women never has any time for anything else.

Another woman is so devoted to "system" that she will sweep every room in the house an Friday, whether it needs sweeping or not, and so she will go through the house with broom and dust-pan, and sweep and dig and raise a cloud of dust that will settle on everything in the rooms which must all be dusted in turn, when a few passes with the carpet sweeper was all that was necessary to reasonably good housekeeping and the comfort of the family.

The reasonably good housekeeper manages to keep her house clean and comfortable and wholesome without slaving all the time. She may not always have "a time for things," but she has a place for things and keeps them in their place. She is careful about making work for herself, and so has a little time for other things than cleaning and scrubbing, and her home is a place of comfort and good cheer, even if it is not so painfully neat as some of her neighbors.—Exchange.

The Emergency Shelf

A housewife who evidently had her hands full and who yet seemed always prepared for the unexpected guest, explained that it was all due to the emergency shelf. One shelf in a cool closet is set aside for such dainties as will keep for some time and are ready for use at a moment's warning. In summer it is sure to contain a can of salmon and one of dried beef. Sealed cartons of crackers, biscuit or gingersnaps insure against trouble if the cooky jar is caught empty. Honey in the comb, if capped over, will keep for months in a dry place. Extracted honey is also a good keeper, and even if it does become "candied" it is still appetizing. If called upon frequently for picnic lunches, a jar of peanut butter is another of the indispensibles. With confectioner's sugar at hand, she can frost a plain cake and transform it into a company affair before her fire is even started, for

WILL GIVE $500 TO SICK READERS OF MARITIME FARMER

Famous Scientist Who Originated the Now Wonderful "Home Treatment" Offers $1.00 Package Free to Sick and Ailing.

In order that every reader of Maritime Farmer who may not have heard of this wonderful "Home Treatment" may have an opportunity to test this celebrated medicine, the now famous scientist, Dr. James W. Kidd, offers to give absolutely free a full size $1.00 package to five hundred readers of this paper, to prove the wonderful claims which have been made for it. In making this offer the scientist said: "I know that there are many people who have been suffering for years with some chronic disease and many of them have spent large sums of money seeking a cure. I know that these people hesitate about investing money in medicine because they have despaired of ever getting well. Thousands have told me that story and many thousands of the same people have told me afterwards that my treatment had cured them after doctors and everything else had failed. I want to prove to a limited number—no matter what the disease, no matter how long they may have suffered no matter how blue and discouraged —that my treatment really and actually does accomplish the wonderful results that have been reported."

People who suffer from Rheumatism, Kidney Trouble, Stomach Trouble, Liver or Bowel Disorders, Catarrh, Bronchitis, Asthma, Chronic Coughs, Weak Lungs, Lumbago, Piles, Urinary Disorders, Female Weaknesses of any kind, the weak, worn out, broken-down and despondent will be delighted at the effect of a few doses. This wonderful treatment creates a fine appetite and helps the digestive organs to carry on their functions as they should. It strengthens the kidneys, too, and drives rheumatism poisons from the blood as if by magic. That is why people who try it become so enthusiastic.

Any reader of Maritime Farmer who will try this extraordinary medicine that has created so much excitement by its cures can obtain absolutely free a full $1.00 treatment by simply filling in the coupon below or writing a letter describing their case in their own words, if they prefer, and mailing it today to James W. Kidd, Toronto, Canada. No money need be sent and no charge of any kind will be made.

As this offer is limited, you should write at once, in order to be sure to receive your free treatment.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. I know that my home treatment is a safe and sure cure for **Leucorrhoea** or **Whitish discharges, Ulceration, Displacement** or **Failing** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths,** also **pains in the head; back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address,** tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost,** my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers of Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhoea, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. this sugar and cold water, with a little flavoring, are all that are necessary.

In winter a fruit cake is a part of the emergency shelf furnishing—will keep well. Cheese is another reliable relish, and if there are dry and dried apples—but she is sure it sometimes only enriched with pork crumbs they are grated and sprinkled over buttered crackers and placed in the oven to crisp.

The company shelf is kept replenished with the same care used in other departments, and as she makes it a rule never to draw upon it save for guests, she is sure not to be caught with an empty cupboard when the guest comes unannounced.—Bessie L. Putnam in Twentieth Century Farmer.

The Cooking and Serving of Vegetables

Vegetables do not hold the important place they should on the average family's table. We are called a nation of meat-eaters, and not only is this claimed by some of our leading physicians to be the cause of many bodily ills, but it is also productive of our greatest expense in the food-bills.

Wonderment is often expressed that the inhabitants of many foreign countries live so comfortably and work so hard on a diet in which meat has such an unimportant place. When foreign cooks behold our usual methods of cooking, they say that we throw away the most nourishing and ner of preparing them. From our tasty part of vegetables by our man-southern sisters we may learn the lesson of long, slow cooking and a clever combination and seasoning. Every farm should have a reasonably good garden so that healthful vegetables may appear at every meal.

Fried Tomatoes—Choose fine, firm tomatoes about half ripened. Remove skin, and cut in slic?s from one-half to an inch in thickness. Roll in cracker-crumbs, and fry in butter, seasoning liberally with salt and pepper.

Vegetable Stew—Cut a variety of vegetables into small cubes. Potato, parsnip, carrot and turnip can be used. To them add a large sweet onion, sliced, one head of celery, cut in small bits, a sprig of parsley, and a little summer savory, if liked. One large tomato, sliced, or an equal amount of canned tomato is a delicious addition for the sake of a change.

Melt a tablespoonful of butter in the kettle, place the vegetable in this, season with salt and a dash of cayenne, and cover very closely. Cook gently for about half an hour, or until the vegetables are well done.

Savory Rice with Thickened Gravy—A dish of boiled rice is often found accompanying a stew of beef or chicken on the southern table; and the combination is not only delicious, but extremely nourishing. Wash a turnip, cut in half-inch slices, pare, and cut into cubes. There should be two or three cupfuls of the prepared vegetable. Place in a kettle with a sliced onion, and cold water to cover. Bring to a boiling point, and simmer gently until the vegetables are cooked to pieces. Drain through a colander, and return the liquid to the kettle. Have ready a cupful of rice; add this, with salt, to the liquid, and cook until the fire is tender and has absorbed the liquid. Carrots may be used in the same way if the flavor is liked. This is an excellent way to use these vegetables when they are "woody" or pithy yet have a good flavor.

Potato Cakes with Roast—Pare good-sized potatoes, and let them stand half an hour in water. Wipe dry, and grate. Place a cheese-cloth in the colander, and let the potatoes drain for a few minutes. Sprinkle with salt, and form into flat cakes with the hands. Place these cakes on a plate in a steamer, and steam for fifteen minutes. Remove the roast from the roasting-pan, lay in the cakes carefully, and baste lor a moment or two. Serve all together on a platter.

Sca,loped Onions—Butter a baking-dish, and sprinkle with cracker-crumbs. Arrange a layer of sliced onions of a mild flavor, sprinkle with pepper and salt, dot with butter, and cover with crumbs. Repeat until the dish is as full as desired. Pour in enough milk to cover, and bake slowly until the onions are tender; thirty minutes usually will suffice.

Tomato Salad—A very attractive salad is made by using the tiny red and yel,ow tomatoes and tiny white onions. Steam the onions tender. Remove the skins from the tomatoes Have them all very cold. Line individual plates with lettuce-leaves, and place alternating red and yellow tomatoes to form a circle; pile onions in the center, and pour a salad dressing over all. If small tomatoes cannot be had, the salad is equally attractive when the onions are served in a large tomato from which the center has been scooped out.—Alice Margaret Ashton.

Quick Action on a Cold

NA-DRU-CO.

One of the most important points in treating a cold is to act quickly, at the first sign of trouble, before the cold has a chance to get "settled" anywhere.

The other point of vital importance is to take

NA-DRU-CO Syrup of Linseed, Licorice and Chlorodyne

This safe and reliable household remedy acts very quickly. It relieves the irritation and "stuffed up" feeling in the air passages, loosens the phlegm, promotes expectoration, soothes the tickling which makes you cough, and drives out the cold before it gets troublesome.

But even if the cough or cold has become deep-seated and persistent, Na-Dru-Co Syrup of Linseed, Licorice and Chlorodyne will break it up.

In 25c. and 50c. bottles, at your druggist's.

NATIONAL DRUG AND CHEMICAL CO. OF CANADA, LIMITED. 313

GREETINGS FOR 1913

AND A HAPPY NEW YEAR

To all our friends and patrons

We make Stoves - - you use them;
Thus we make friends--not lose them,
For every owner of an **Enteprise**
Stove, Range or Furnace of any size
Becomes our friend when the goods are tested
And knows the money's been well invested.
That's why when we say "HAPPY NEW YEAR,"
To friends and customers everywhere,
It covers thousands in homes and in trade
Who know us by proxy—through "GOODS WELL MADE."

The ENTERPRISE FOUNDRY CO., SACKVILLE, N. B.

— Makers of High Grade Stoves, Ranges and Furnaces —

To Make Old Sad Irons New

Old sad irons that have become rough from overheating or any cause may be made smooth and clean by painting them with aluminum paint, which can be applied by anyone who can use a brush. One housewife I know has painted her kitchen range with the paint mentioned, also her stovepipes, sinks, garbage pails, etc.

Green Tomato Pickle.

½ pk. green tomatoes.
½ doz. onions.
2 cups sugar.
2 tb. mustard seed.
1 tb. celery seed.
2 tb. salt.
1 tb. whole cloves.
1 qt. vinegar.

Chop all fine and squeeze out the water. Cook all together for one and one-half hours.—Mrs. Fox.

Troubled With Weak Heart.

Was All Run Down.

Many people are unaware of having anything wrong with their heart till some excitement, overwork or worry causes them suddenly to feel faint or dizzy, and have an all-gone sinking sensation.

On the first sign of any weakness of the heart or nerves, you should not wait until your case becomes so desperate that it is going to take years to cure you, but avail yourself of a prompt and perfect cure by using Milburn's Heart and Nerve Pills.

Mr. Thomas A. Stevenson, Harris, Sask., writes:—"I was troubled with weak heart, and was all run down for a long while. I was almost in despair of ever getting well again, until a friend recommended me to try Milburn's Heart and Nerve Pills. After the first box, I was much better, and three boxes cured me. I am now, as well as ever, and will highly recommend them to any one else troubled with a weak heart."

The price of Milburn's Heart and Nerve Pills is 50 cents per box, or 3 boxes for $1.25.

For sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

COMFORT IN THE RURAL HOME

The installation of a **GOOD HEALTH CHEMICAL CLOSET** in your home means health--convenience--comfort--for the whole family. Not a luxury but a necessity. A postal will bring you full particulars. Address

Gates' Nerve Ointment

For Frost Bites

C. Gates, Son & Co.,
Middleton, N S.

Gentlemen:--I had the misfortune to freeze my toe which caused me a great deal of suffering, and although I had it treated, yet without success till I used your Nerve Ointment, which has completely cured it, and I have no hesidency in recommending it to others as the best I ever used,

Yours sincereiy,
Matthew Wood,
Point Phillip, N. S.

Persons troubled with partial paralysis are often very much benefited by massaging the affected parts thoroughly when applying Chamberlain's Liniment. This liniment also relieves rheumatic pains. For sale by all dealers.

FLORICULTURE.

R. O. N., and Flower Lover ask for directions re care and general treatment of Rubber Plants, both as regarhs repotting and the use of special fertilizers. Also in regard to the application beef steak, castor oil, coffee, etc.

As the season approaches when a general overhauling of such plants as Palms, &ubbers, Dracenas is advisable, a few words of cultural advice may not be amiss. First, as regards fertilizers, of all the strange and unique remedies for all the plant diseases that are commonly used, the Rubber Plant seems to have the largest list. I have heard of the use of milk as a bath (no reflection on Anna Held); cream applied to the soil; sweet oil on the foliage tips; of unburned matches stuck into the soil; the leaves as a top dressing in addition to this castor oil and beef steak, etc. etc., as first mentioned. As to the efficiency of such fads I am unable to give any opinion, but I can assure our readers that the use of properly prepared soil and sufficient light, coupled with cleanliness of foliage and freedom from dust and insects will make the use of any such freak remedies or foods unnecessary.

Water the plants only when the soil becomes fairly dry and be sure that no water is allowed to stand in the jardiniere or saucer. Give as much light as possible and fresh air when warm enough. Sunlight is not absolutely necessary. In repotting do not make the cbmmon mistake of using a pot several sizes too large, use one size larger only, and remove the loose soil from the old ball of roots, taking care not to disturb the roots in any way. Simply remove the top or unused soilf Have a clean pot and thoroughly soak it in water. Use rich, light soil. Unless you have good materials at hand it is best to procure this from your florist telling him what you want the soil for. Put plenty of broken pots or charcoal in bottom of pot, so that drainage may be perfect and thoroughly pack in the soil with a flat thin stick, and do not water until necessary. In case of such plants and those that have lost their leaves, leaving simply a bunch at the top the best thing to do is to make a small incision with a sharp knife at an eye or joint close up to the leaves. Bind tightly around this a bunch of moss about the size of your fist and keep this thoroughly wet at all times. You will, in the course of several weeks, see roots appearing on the surface of the moss. When the top can be cut off below the moss which being removed will allow the new plant to be potted in a small pot and in this way a new plant will be secured, which will be even better than the old one. The stump will produce a bush plant of pleasing appearance and compact growth.

To sum up, the care of a Rubber Plant consists of: Plenty of light. Absence of drafts. Perfect drainage. Moderate amount of water when dry. Close potting, and most important of all, cleanliness of foliage.

Palms and Dracenas require much the same treatment and care, growing less rapidly, particularly palms, require potting less often. I have known palms to keep in perfect condition producing a good leaf each year and holding foliage well without repotting for a span of four years. Of course, this is rather exceptional, yet shows that it would be easy to overpot if the ordinary rules of plant culture were followed.

Any questions, regarding the culture of flowers, addressed to H. E. Goold, Florist, Susex, N. B., will receive prompt attention in this column.

How to Keep Fire All Night.

I have never had any trouble keeping the fire all night, and the plan is very simple. I consider it more economical to keep the kitchen fire all night and running continuously. I only average a medium-sized hod of coal for 24 hours. I get splendid results from my oven;

I start the fire about September 1 and it is never out until about June 1. We burn common nut coal and my husband brings in a hod each night and morning, although I never use it all only in the coldest weather. About 9 o'clock each night I shake down the fire until all the ashes are out and I have a good layer of red coals on the grate; rake a little. Be sure that all ashes and clinkers are out and a solid fire rests on the grate. Then I open the drafts and put on more coal to come level with the fire box, and as soon as a bright blue flame or blaze comes through I close all dampers and after waiting a moment or two for the gas to subside I open the cold air damper which new coal. I usually have the drafts is in front and near the top of the range. I let it entirely alone until 9 or 10 in the morning before adding new coal. I usually have the drafts open and shut several times before the coal is put on. My range has three dampers, the oven, funnel and front dampers and two cold air drafts, one of which is seldom used as it is used to cool the stove, and this is not necessary if care is used. If the heat is allowed to come too near the stove covers it causes them to warp.

In the morning shake the fire well again, let it burn up and you will have an apparently fresh fire. If you wish to bake, thoroughly shake it down, open the dampers and put on coal gradually, then close it up tight. By the time the coal has been renewed two or three times your oven is hot enough for biscuit; that is, if you have kept it level with the fire box. I can dress and have hot biscuits in forty minutes. Two very important items are, you must keep the ash pan clean, and also the under part of the top of the stove over the oven, if you want a hot oven.

Cinders are especially fine to bank a fire at night and every bit of coal should be sifted. Now remember, you can save coal, time and money by keeping a continuous fire. The kitchen is warm and cozy; the water is always hot.

After breakfast add the new coal as you did the night before. Close all dampers as before. If required for dinner and supper open and shut drafts as you need to. Do not let the coal get started; hold it back all you can. Keep a steady, even heat at all times.—Mrs Fred Orne in N. E. Homestead.

Mr. and Mrs. Manning K. Ells had a call on Tuesday evening Dec. 17 from a number of their immediate friends. It was the occasion of their tenth wedding anniversary and a most enjoyable evening was spent by all. Mr. and Mrs. Ells received many remembrances and an abundance of good wishes for the occasion.—Kentville Advertiser.

Mr. Ells who is Secretary of the Nova Scotia Fruit Growers Association is also a frequent contributer to the columns of the Maritime Farmer.

At this date the Maritime Farmer joins with Mr. and Mrs. Ells' friends in good wishes for many future years of usefulness.

Dates to be Remembered

Nova Scotia Farmers' Association Annual Meeting, Sydney, N. S., January 21 and 22, 1913.

Cape Breton Poultry Show, North Sydney, N. S., Jan. 21st to 23rd, 1913.

Annual Meeting of Nova Scotia Fruit Growers' Association, Middleton, N. S., Jan. 28th, 29th, 30th, 1913

Here is a remedy that will cure your cold. Why waste time and money experimenting when you can get a preparation that has won a world-wide reputation by its cures of this disease and can always be depended upon? It is known everywhere as Chamberlain's Cough Remedy, and is a medicine of real merit. For sale by all dealers.

Butter Parchment.

Possibly there is no commodity in common use by farmers of the Maritime Provinces so subject to fraud as the every-day parchment paper used for wrapping butter. This paper, in its pure state, is manufactured wholly in Germany. Attempts have been made in other countries to compete with the Germans for this trade but without success. The result is that many inferior papers, known to the trade as imitation parchments, have been offered for sale all over the country. A butter parchment is used because it is first grease proof and it will resist the passage of water as well. This guards effectually against contamination of the butter by contact with wood or other substances likely to affect the quality of the butter. The first essential of good parchment, therefore, is that it be pure and what it is represented to be.

The Maritime Farmer is in a position to offer its subscribers a pure parchment from the best mills in Germany and it proposes to do so at practically wholesale prices. The only condition attaching to the offer is that an order must be sent the Maritime Farmer for at least five reames of parchment, or 2,500 sheets, printed or plain. The plan is an easy one to work out. When you want parchment ask your neighbors to make up and order with you, until you have five reames or over and send it to us or, better, write us for prices and we will be able to save you a good round sum on your order. We will give you the paper at the same price you would pay a wholesale dealer. Moreover, the Farmer will guarantee that every sheet of parchment will be pure. It will not taint your butter but will preserve it in every case. What we want is the opportunity to show you how much money we can save you. It will represent a very nice percentage on the usual prices you have been paying.

Hollow Potatoes.

During the past season there have been a good many complaints from potato growers that, although the yield has been good, many of the largest and finest tubers are found, on cutting, to be hollow. This is an occurrence which is not uncommon in seasons which have favored the rapid growth of the tuber, and for a similar reason it is found more commonly in large tubers than in those of small or medium size. A potato grows by the addition of new layers of tissue slightly below the skin. The cells composing this tissue are at first small but rapidly expand to their full size, and in so doing set up a state of tension. The layers of cells towards the outside, being young, are capable of dividing and expanding in a similar way so that an external cracking or splitting is avoided. It is different, however, with the tissue in the interior. This in a state of growth, and if the tenis composed of mature cells no longer sion becomes too great a tearing or rupture of the tissue will result, followed by degeneration and the formation of a cavity.

Cavities of this nature are much less serious than injuries on the outside of the tubers, since the latter permit of the entrance of numerous organisms of various kinds which cause rotting. They do, however, necessitate increased trouble in preparing potatoes for the table since the discolored surface of the cavity must be cut away. Hollow potatoes are also particularly objectionable for baking. However, the factor of rapid growth which is liable to bring about this condition is in the main one necessary to the securing of a large yield, and most farmers will probably prefer to so stimulate growth by cultivation and fertilizers as to attain this end and take the risk of a certain proportion of tubers becoming hollow.

If your children are subject to attacks of croup, watch for the first symptom, hoarseness. Give Chamberlain's Cough Remedy as soon as the child becomes hoarse and the attack may be warded off. For sale by all dealers.

The Moncton Poultry Show.

Another milestone in the history of the Westmorland Poultry and Pet Stock Association has been reached and marked by their Pouftry Show, which was held recently in Moncton.

The various breeders, as well as the principal business men of that town, were jubulant over the success of the show, both in point of number of entries and in attendance.

The best birds in New Brunswick, from ehe Nova Scotia ,ine up to Carleton Co. were exhibited and George Robertson, of Ottawa, who placed the awards, found lots of quality among the farmer's feathered frriends there exhibited.

A banquet was held during the Fair by the exhibitors, and the many optimistic points which marked the addresses of the after-dinner speakers, bids well for the future of the poultry industry.

Much credit for the success of the show is due J. V. Jackson, President and Geo. Seaman, Secretary of the Association.

Following is a list of the prize winners :

RHODE ISLAND REDS, S. C.

Cocks—1, F. M. Merritt; 2, Dr. E. A. Smith; 3, Glenview Poultry Yards.

Hens—1, Dr. E. A. Smith; 2, Hartland Poultry Yards.

Cockerels—1, F. M. Merritt; 2, Glenview Poultry Yards; 3, Miss Louise C. Brown.

Pullets—1, F. M. Merritt; 2, Miss Louise C. Brown; 3, Hartland Poultry Yards.

RHODE ISLAND REDS, R. C.

Cocks—1 and 2, Geo. H. Seaman; 3, Hartland Poultry Yards.

Hens—1 and 2, Geo. H. Seaman; 3, Hartland Poultry Yards.

Cockerels—1, 2 and 3, Geo. H. Seaman.

Pullets—1, 2 and 3, Geo H. Seaman.

BUFF WYANDOTTES.

Cocks—1, Hartland Poultry Yards.

Hens—1, Hartland Poultry Yards; 2 and 3, Alex Donald.

Cockerels—1 and 2, Alex Donald; 3, Hartland Poultry Yards.

Pullets—1 and 2 Alex Donald; 3, Hartland Poultry Yards.

SILVER WYANDOTTES.

All prizes went to E. S. McKie.

GOLDEN WYANDOTTES.

Cocks—, Hartland Poultry Yards; 2, F. Mf Merritt; 3, D. Brace.

Hens—1, F. M. Merritt; 2, Geo. H. Seaman; 3, Hartland Poultry Yards.

Cockerels—1, Geo. H. Seaman; 2, D. Brace; 3, Hartland Poultry Yards.

Pullets—1, D. Brace; 2, Geo. H. Seaman; 3, D. Brace.

PARTRIDGE WYANDOTTES.

Cocks—1, F. M. Merritt; 2, A. A. Leaman.

Hens—1, F. M. Merritt.

Cockerels—1i A. A. Leaman.

Pullets—1, A. A. Leaman.

COLUMBIAN WYANDOTTES

Cocks—1, Orchard Hill Farm; 2, Hartland Poultry Yards.

Hens—2, Orchard Hill Farm; 6, Hartland Poultry Yards.

(Continued on page 254)

You can't judge quality by size— and this applies to bread as well as to men.

YOU may have an idea because western wheat flour makes a big loaf of bread, that the quality is in keeping with the size. The largest men have not accomplished the greatest deeds.

Size is the only feature that can commend western wheat flour to any cook. And the good cook quickly discovers that quantity without quality is not worth buying.

"BEAVER" FLOUR GIVES BOTH QUALITY AND QUANTITY, because it is a blended flour. It is mostly the choicest Ontario fall wheat with sufficient Manitoba spring wheat to equalize the strength.

In "Beaver" Flour, you get the famous pastry-making qualities of Ontario wheat—you get the fine texture, the evenness and the delicious flavor of Ontario wheat—you get the nutriment of Ontario wheat—with the "strength" of Manitoba wheat which makes the dough "stand up" in the oven.

One of the big conveniences of "Beaver" Flour is the fact that it is equally good for bread and pastry—and best for both.

"Beaver" Flour is superior to any western wheat flour for any and all kinds of baking, and is the cheapest flour you can use because the most economical.

The Shape of Thin and Fat Horses.

The changes which occur in a horse's form during fattening iwere studied by Prof. W. A. Cochel during the feeding test he conducted at the Pennsylvania experiment station. By means of an ingenious linked measuring device the exact outlines of the horse's girth at the chest, middle and flank were recorded at different stages in the fattening process. It was found that in chest, for example, the location of the point of greatest width was nearly 2 inches lower when a horse is thin than after he is fat. In the outlines of the paunch of thin horses there is a flattened appearance above the middle of the body which is filled out during fattening so that the cross section then makes nearly a perfect circle.

Both of these changes result in giving a horse considerably more width of back and loin after he is fat. Average measurements of a carload of horses showed 3.6 inches more width of chest after fattening, 3.7 inches larger heart girth, 3.3 inches more of middle girth and 2.1 inches greater girth at the flank. The measurements also show an increase of .4 of an inch in the height of the withers and .7 of an inch at the croup, while the croup increased .6 of an inch in width and .7 of an inch in length. When the horses were put to hard work so that they lost the surplus fat, they returned almost to their original outlines.

The changes in measurements due to fattening indicated that the large thick muscles along the upper part of the body attract the greatest deposit of fat, presumably to a large extent intermixed with their muscle fibres. As heavy muscles lie over the croup and loin the height at the hips increases during fattening, while the height of the withers remains practically the same.

Winter Hard on Small Pigs.

Many small farmers buy fall pigs and fail to make them do well, but do not know the reason. Fall pigs will not winter well and make a good profit unless several restrictions are carefully submitted to. First, make arrangements to let them have access to out of doors whenever they are disposed to go out. Pigs shut up indoors languish. They want to run out when the weather is severe, even if they return at once some days. Swine carry so much of a coating of fat that they will stand more cold than many suppose. Frequently the kind-hearted owner closes the doors and expects pigs to go on growing. But they refuse. The larger the pigs when severe weather comes on the better they will do. Do not buy late pigs unless you expect to slaughter them for roasters by Febuary at latest. Of course, if you live where the climate is mild, this does not apply. But all young animals must have plenty of exercise.

Second, do not let them work or lie in heating manure. The warmth appeals to them, they spend too much time in it and then rush into the cold, only to be attacked by lung and other kindred troubles. The rooting over of manure in summer will not harm. Give plenty of bedding and a sleeping room where drafts cannot blow over them. And let it be dry. Dampness is detrimental to swine any time, but especially so in winter.

Third, milk is likely to be scarce in winter, and for this reason many persons are not situated right to take on young pigs. They need milk because they are young, and all the more because the weather is trying to digestion. Persons with young swine that do not grow forget some of these things. A hot slop (not too hot) winter mornings is relished by

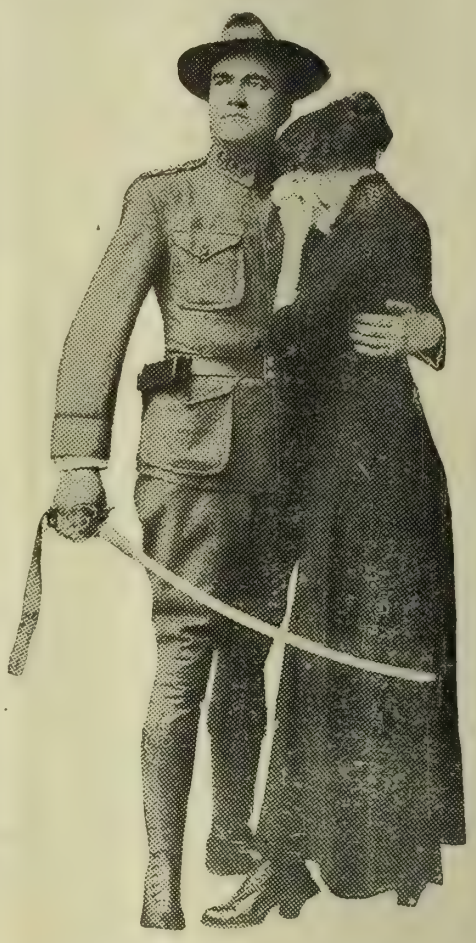
For New Vitality Send Me The FREE COUPON

There is to-day no excuse for any man remaining weak. The vital, manly man is admired by all men as well as all women; there is an influence about him no one can resist; he knows no fear; he knows no weakness; he knows no result of debility. It is this same VITALITY which carries our young soldiers to war without thought of death. Vitality, reader, is what you MUST have if you would enjoy a life of health, strength and manly vigor. I can give you this same life and vitality; if I can do for you what I am doing for thousands of others I can put the vigor of youth into your blood and nerves; I can make you feel young again and keep you feeling young; I can drive away all dibility, weakness and despondency. You will laugh at trouble, you will tackle obstacles with the vim to win, just as all other hearty vital men may do. I don't ask you to use drugs. I ask no change in your present mode of living; just cease all dissipation and then use my HEALTH BELT. All else will come. My Health Belt with suspensory attachment is the greatest nature cure and VITALITY supply that the world has ever known or probably ever will know. Nothing is taken for granted: you feel better immediately, at once, from the first time used. Worn all night, while you sleep, it pours a great stream of Vitality and energy into your weakened system: it is a wonder-working giant of power; made as I now make it, I am getting results of which no man ever dreamed. Just think, over ten thousand men applied to me during the month of February. I am now sending great shipments of my Health Belt to every part of the civilized world. There is a reason, I am curing; I am giving men back their lost strength. It makes you feel ambitious, full of vim; you awaken mornings sparkling with bright, clear-eyed, clear-brained health; the weakness has all disappeared from your back; you are "just feeling fine." Special attachments to my Health Belt cure rheumatism, kidney, liver and stomach trouble.



Let Me Send You THIS BOOK Free

Fill in the coupon; let me send you at once my free booklet in plain sealed envelope; it is profusely illustrated with half-tone photos; keep it in your pocket for easy reference; read the chapter on Vitality; read the chapter on Debility; read the chapter on those subjects which interest every man, young or old, who would be strong in manly vigor. It is a word of hope, a carefully written, interesting booklet, which should be in everyone's possession. Therefore, send to-day. If in or near the city, call at my office. Free

all hogs, and seems needful where the pigs are making their first growth.

Fourth, constipation, that enemy of all animals is more than likely to attack young pigs that are deprived of green food, and under stress because of any lack of nutrition. It must be guarded against. Give fruits, vegetables, sods, branches of apple trees, bran, middlings, molasses, small doses of wood ashes, and lastly, if necessary to get the bowels in order, persistent driblets of glauber salts in the food. Their internal and external functions must all be active and harmonious. Then winter pigs will grow and pay.

The Sire Half the Herd.

This statement has been made so often that it has come to be generally accepted as true, although few breeders know just how it works out. The following table shows the rapidity with which the blood of a sire accumulates in the high grades. The same figures hold when sire of one breed or family are used on a herd.

Generation.	Blood.	Improved p. c,	Unimproved p. c.
1	½	50	50
2	¾	75	25
3	⅞	87.5	12.5
4	15-16	93.75	6.25
5	31-32	96.87	3.12
6	63-64	98.43	1.56

Founding a Sheep Flock.

Since the new edition of the bulletin "Sheep Husbandry in Canada" was issued a few weeks ago, there has been a constant stream of requests for it flowing into the publications Branch at Ottawa. A great many of the applicants state that they are just commencing, or are about to commence, sheep raising and that they wish to learn how to handle a flock successfully. This bulletin contains a chapter specially prepared for such persons describing how best to establish a flock of commercial sheep. The author, Mr. J. B. Spencer recommends a flock of fifteen ewes as the minimum for a farm of one hundred acres. Such a flock can be increased with experience, but not beyond twenty to twenty-five unless it is desired to make a special business of sheep raising. With the management and care described in the bulletin, an increase through lambs can be expected of from 150 to 175 per cent. and it should be the latter.

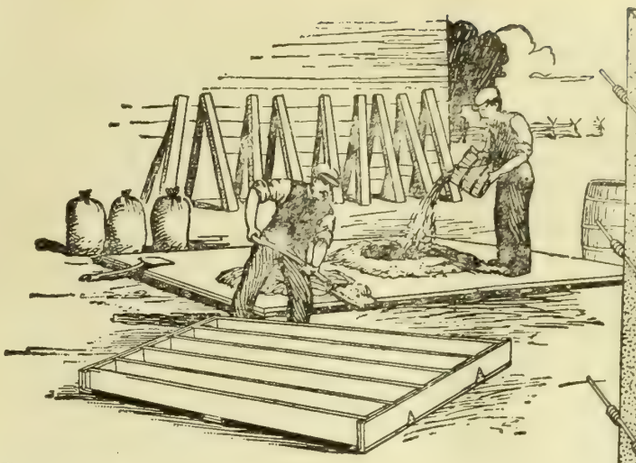
The early weeks of autumn is stated to be the best time to purchase ewes as then one can select those that have raised good lambs.

Before the present edition of the bulletin is fully exhausted a still further one will be ordered so that no one need hesitate about ordering a copy which will be sent free to all who apply for it to the publications Branch, Department of Agriculture Ottawa.

Twelve Years of Persistent Showing.

Public interest in the poultry departments at the Maritime Winter Fair is maintained and growing. At the recent Fair, Craig Bros. were the sole survivors of the first exhibitors there twelve years ago. During the twelve years, Craig Bros. have been consistent winners and have always courted a strong rivalry in the variety of their choice, Barred Plymouth Rocks. When they were beaten in the Utility classes this year they had the satisfaction of seeing the winnings go to their patrons.

In commenting on Craig Bros. persistency in showing one of the Amherst papers said: "Men may come and men may go in the poultry show but Craig Bros. apparently are in the game for keeps."



Turn idle hours into concrete fence posts

EVERY farmer finds himself now and then with a few idle hours in which both himself and his help must look for "odd jobs" to keep them busy. Use these hours to make concrete fence posts. You can make a few at a time, storing them until needed. Then when you want a fence in the new field, your posts—everlasting, concrete posts—are all ready to use. The making of fence posts is only one of scores of every-day uses for concrete on the farm described in the book,

"What The Farmer Can Do With Concrete"

NOTE—This 160 page book will be sent to you free upon request. You do not have to agree to use cement or place yourself under any other obligation. Just send us your name and address. Address,

Publicity Manager

Canada Cement Company Limited

512-561 HERALD BUILDING, MONTREAL

WHEN you buy cement, remember that the farmers of Canada have found that "Canada" Cement is best. Look for the label on every bag and barrel.

CANADA CEMENT COMPANY LIMITED PORTLAND CANADA CEMENT MONTREAL

Prove the "BISSELL" by Its Work

Do the gangs on your Harrow crowd together and raise out of the ground if it is hard? They won't do this on the "Bissell." The "Bissell" is so designed that THE GANGS CAN'T CROWD OR BUMP together no matter how hard the ground may be.

Tough soil won't stick the "Bissell." It stays right down to its work and pulverizes the ground thoroughly.

We ask you to take a "Bissell" out into the field and test it beside other Harrows. Then you will HAVE PROOF that it is A SUCCESS ON HARD LAND—THAT IT PULVERIZES THE BEST—and that it is the lightest draught.

Post yourself fully on Harrows before buying. We put our name on every Harrow so that you will know it is genuine. Ask your local dealer, or write to Dept M for free catalogue.

Fruit Growing in Canada.

A year ago the Department of Agriculture at Ottawa, through the Branch of the Dairy and Cold Storage Commissioner, undertook an investigation of the fruit growing conditions throughout Canada. The enquiry was intrusted to Mr. Wm. H. Bunting, an extensive fruit grower at St. Catherines, Ont., who secured as much information as possible on the following paints:—

1. The possibilities of an extension of the fruit growing industry of Canada in the different localities visited.

2. The tendencies in the matters of the planting and growing if different kinds of fruit, and with regard to apples, the varieties which are being most extensively planted in the different districts.

3. The difficulties which are likely to be encountered in the further development of the fruit growing industry.

4. Methods of production and orchard management which have been most successful in the different districts, and the probabilities of over production.

5. The conditions under which British Columbia, Ontario and Maritime Province fruit is marketed in the prairie Provinces as well as the character and the effect of American competition.

The enquiry was concluded in due time and the report has been printed for general distribution. It contains a large amount of detailed information gathered in every province making it an invaluable guide to persons who desire to take up fruit growing as an industry.

In his general conclusions Mr. Bunting points out that while the growing of fruit offers ample reward to the man of energy, patience and perseverance, there is perhaps no phase of agricultural endeavour which requires to be more closely studied and in which a wider range of information is more desirable and necessary. The future of the industry he states, was never brighter than it is today, the prospects never more attractive nor the field of extensive effort in all fruit growing provinces more inviting.

The report which contains eighty-four printed pages and many illustrations is available to all who apply for it to the Publications Branch of the Department of Agriculture, Ottawa, Ont.

A COLD
However Slight
MAY TURN INTO BRONCHITIS.

You should never neglect a cold, however slight. If you do not treat it in time it will, in all possibility, develop into bronchitis, pneumonia, asthma, or some other serious throat or lung trouble.

On the first sign of a cold or cough it is advisable to cure it at once, and not let it run on for an indefinite period.

For this purpose there is nothing to equal Dr. Wood's Norway Pine Syrup, a remedy that has been universally used for the past twenty-five years.

You do not experiment when you get it.

Mrs. Louis Lalonde, Penetanguishene, Ont., writes:—"When my little boy was two years old he caught a cold which turned into bronchitis. I tried everything to cure him, even to doctor's medicine, but it did him no good. One day I was advised to give Dr. Wood's Norway Pine Syrup a trial, and before he had half a bottle used, he was cured. I would advise all mothers to try it, as good results will follow. My home is never without it."

See that you get "Dr. Wood's," as there are numerous imitations. It is put up in a yellow wrapper, 3 pine trees the trade mark; the price, 25 and 50 cents. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

FREE This 150 PIECE Complete Scholar's Outfit FREE

BOYS AND GIRLS, NEVER BEFORE IN CANADA HAS SUCH A GRAND PREMIUM BEEN OFFERED AND SO EASY TO GET.

READ WHAT THIS GRAND SCHOLAR'S OUTFIT CONTAINS.

1 large leather bound school bag, 1 dozen fine quality H. B. pencils, 6 steel tip pen holders, 1 dozen 292 pennibs, 50 sheets of writing paper, 1 dozen envelopes to match, 1 box of 15 water color paints with brushes and pots, 10 beautiful drawing crayons of different colors, 1 fine quality steel blade penknife, 1 large hardwood slide top pencil box, 1 complete printing outfit containing type, ink, tweezers and stamping pad, 1 twelve inch ruler, 1 large memorandum book, 1 complete dater good for five years, 1 large rubber eraser, 1 steel blade pencil sharpener, and last but not least, 1 Swiss warbler the greatest invention for imitating birds and animals.

Think of it this scholar's complete outfit is **FREE.** We are determined to sell a million packages of Marvel Bluing this year and are sparing no expense to reach this mark.

Marvel Bluing is a great improvement on the old style of bluing and goes twice as far. Everybody buys it because it is so good and a present is given away with every package.

We will give you one of these grand scholar's outfits **IF YOU WILL AGREE TO SELL ONLY 25 PACKAGES OF MARVEL BLUING AT ONLY 10c. PER PACKAGE.** Any boy or girl can sell 25 packages easy. No trouble at all.

We send you the Marvel Bluing free and trust you with it until sold. Simply send us your name and address to-day. Every girl and boy should win one of these grand scholar's outfits.

Try. If you can't sell the Marvel Bluing send it back to us.

Address to-day **THE MARVEL BLUING CO., Dept. S. 101 Toronto, Ont.**

EXTRA SPECIAL PRIZE FOR PROMPTNESS

A $2.50 fountain pen has 14k solid gold nib, with Iridium tip, large hard rubber bowl, a guaranteed writer. Every boy and girl has an opportunity to secure one of these fountain pens, just for being prompt in answering this advertisement.

Come again, Pie Time, and often.
For wholesome, *digestible* "eats"
—give us PIE.
At its very *best* wrapped in a FIVE ROSES crust.
Upsets Pie Prejudice *without* upsetting the Eater's Insides—FIVE ROSES flour.
Great for Pie Crust — top and bottom.
And Puff Paste and *Difficult* Things.
Close-grained — melting — even textured.
Flaky, too, and crinkly — crisp yet *tender*.
Put into *your* bake things the rare nutlike sweetness of *Manitoba* wheat kernels.
All soppy with the rich red juice of the cherry—or lemon pie—or apple—or healthy custard—meat, may be, or mince—
Put the FIVE ROSES "crust end" about 'em.
See the hungry *wedges* fade behind busy milk teeth.
At Pie Time—
Use FIVE ROSES.

Free to Stock and Poultry Raisers

We will send absolutely free, for the asking, postpaid, one of our large sixty-four page books, with insert, on the common diseases of stock and poultry. Tells how to feed all kinds of heavy and light horses, colts and mares, milch cows, calves and fattening steers; also, how to keep and feed poultry so that they will lay as well in winter as summer. No farmer should be without it.

NOW is the time to use Royal Purple Stock Specific. At a cost of only two-thirds of a cent per day per animal, it will increase it 25 per cent. in value. It permanently cured Bots, Colic, Worms, Skin Diseases and Debility. Restores run-down animals to plumpness and vigor. It will increase the milk yield three to five pounds per cow per day and make the milk richer.

Royal Purple is not a stock food. There is no filler used in its manufacture, and we import from Europe all the seeds, herbs, barks, etc., and grind them on our own premises. Therefore, we can guarantee it to you as being absolutely pure. We do not use cheap filler to make up a large package. We give you the best condition powder ever put on the market in a concentrated form.

A tablespoon levelled off, once a day, is sufficient for a full-grown animal. It prvents disease, keeps your animals in perfect health, and is absolutely harmless. It makes six-weeks-old calves as large as ordinary calves at ten weeks. You can develop six pigs ready for market in just one month's less time than you can possibly do without it, at a cost of only $1.50, saving you a month's work and food.

A 50c. package will last a horse 70 days. A $1.50 pail or air-tight tin, containing four times as much as a 50c. package, will last an animal 280 days.

If you have never used it, try it on the poorest animal you have on your place, and watch results. If it does not produce better results than anything you have ever used, or give you satisfaction, we will refund your money.

Toledo, Ont., July 1, 1910.

W. A. Jenkins Mfg. Co., London, Canada.

Gentlemen,—I have used a part of a package of your "Royal Purple Stock Specific." I fed it to one cow according to directions. She gained six pounds of milk while using part of a package. The rest of my herd reduced in milk while this one gained. I consider it has no equal.

T. G. BELLAMY.

Bondhead, Ont., Aug. 31, 1912.

The W. A. Jenkins Mfg. Co., London, Ont.

Gentlemen,—After experimenting with a great many stock foods, I was about convinced that there was very little virtue in any of it, but your dealer insisted on me trying Royal Purple Stock Specific, saying it was different from all others. I have since used a great lot of it, as I keep from ten to twenty horses and about the same of cattle. This Specific, in my opinion, is certainly in a class by itself as a conditioner, and is the best I have ever used.

GEORGE MAPES.

Clear Creek, Ont., Sept. 19, 1912.

W. A. Jenkins Mfg. Co., London, Ont.

Dear Sirs,—Your "Royal Purple" Stock Specific is the best stock conditioner I have ever had in my stables, and am never without it. I had a brood sow that had milk fever very bad. Your "Royal Purple" saved her life. Put her on her feet in three days. I had three calves last spring that got scouring very badly. Could not get it stopped until I used "Royal Purple." It did the work O.K.

Yours truly, H. B. MOULTON.

Saskatoon, Sask., Sept. 20th.

The W. A. Jenkins Mfg. Co., London, Canada.

Gentlemen,—Some months ago we bought some of your Royal Purple Stock Specific from Mr. Vogan here. We have been using it ever since, and we find it the best conditioner for driving horses we have ever tried.

H. F. McCALLUM, "The Palace Livery."

Scott, Sask., May 22nd, 1911.

The W. A. Jenkins Mfg. Co., London, Ont.

Dear Sirs,—Do you want a man to represent your Royal Purple goods in this district. I am from Ontario, and have fed your Stock Specific—got it from Mr. J. Corbett, of Brownsville. My cows, while us ng it, made the largest average, and tested five points over average at C.M.P. at Brownsville. I know your goods are the highest class Stock Specific on the market, and take great pleasure in representing you in this district

NORMAN G. CHARLTON.

Royal Purple Poultry Specific

will make your hens lay in winter, as well as summer, and yet a 50c. package will last 25 hens 70 days, or a $1.50 pail or air-tight tin, containing four times as much as a 50c. package, will last 280 days. It prevents poultry from losing flesh at moulting time, cures and prevents all the ordinary diseases, makes their plumage bright, and keeps them in prime condition.

Port Colborne, May 11.

W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—This is to certify that I have used one $1.50 tin of your "Royal Purple" Poultry Specific, and there is nothing that can equal it. I wanted yours again and your agent did not have any, so he gave me another brand, and I can assure you it was not worth carrying home, for my hens layed better without it. I have been from 12 to 15 dozen eggs short every week since I have not used your "Royal Purple."

CHARLES RICHARDSON.

Sherbrooke, Que., Aug. 1, 1910.

W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—I have used your Specific for one year, and have given it to my birds with good results. See my winnings at the different fairs, which will tell the tale.

MISS GEORGINA CAMIRAUD.

Royal Purple Cough Specific

During the last four years there has been an epidemic cough going through every stable in Canada, which has been a great source of annoyance to horsemen. Our Royal Purple Cough Cure will absolutely cure this cough in four days, will break up and cure distemper in ten days. Absolutely guaranteed. 50c. per tin; by mail, 55c.

Royal Purple Gall Cure

will cure all sorts of open sores on man or beast. Will absolutely dry up and cure scratches in a very few days.

MR. SAM OWEN, coachman for the Hon. Adam Beck, says: "By following directions, I find your Royal Purple Gall Cure will cure scratches and make the scabs peel off perfectly dry in about four or five days." Price, 25c.; by mail, 30c.

Royal Purple Sweat Liniment

will reduce lameness in a very short time. Mr. John M. Daly, coalman in London, says: "We have nine horses constantly teaming coal, and have all kinds of trouble with them being lame at times. I have used your Sweat Liniment for a year back, and have never known it to fail to cure sprained tendons, etc." Price, 50c., 8-ounce bottles; by mail, 60c.

Royal Purple

STOCK AND POULTRY SPECIFICS

A second from Mr. Richardson as follows :—

Port Colbborne, Ont., Aug. 24, 1910.

W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—Please find enclosed express order for $3.00, for which please send me two tins of your "Royal Purple" Poultry Specific.

C. RICHARDSON.

A third letter from Mr. Richardson as follows :—

Port Colborne, Ont., Aug. 29, 1910.

W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—I received two tins of "Royal Purple" Poultry Specific all O.K. I have tried all kinds of specific to make my hens lay, and I find that you are the only ones that manufacture the genuine article. All the rest, I think, is a waste of time and money to bother with. As an egg-producer, I cannot praise your Poultry Specific high enough, for I would not be without it if I had to pay double the money.

C. RICHARDSON.

Royal Purple Lice Killer

This is entirely different from any lice killer on the market. In order for you to understand the process of manufacture of this lice killer, you will have to send for one of our booklets, as we give you a full history of it there. It will entirely exterminate lice on fowls or animals with not more than one or two applications. It smothers them. Price 25c.; by mail, 30c.

Royal Purple Disinfectant (Sheep Dip)

In this line we give you the largest value for the money of any disinfectant on the market. A tin containing 1 3-8 qts. Imperial measure will cost you only 50c. Also put up in 25c. tins.

Royal Purple Roup Cure

Mr. Dulmage, the great breeder, of White Rocks, tells us that he has never used a Roup Cure that will give relief so quickly to hens suffering from Roup or kindred diseases. Our book tells you all about it. 25c. per tin; 30c. by mail.

Royal Purple Worm Powders

For animals. 25c. per tin; by mail, 30c.

In using our Stock Specific, we guarantee you better results by using the ordinary food grown on your farm, such as good hay, oats and bran, and so forth, than you can possibly obtain by using any of the many patent foods on the market. In these the percentage of nutrition is usually very small for the amount of money paid for the same. You know exactly what hay, oats, bran, chop or any farm products cost you, and ROYAL PURPLE makes animals digest these foods properly.

What we wish to impress on your mind is that we manufacture nothing but pure, unadulterated goods. Our booklet gives over 300 recommendations for our different lines from people all over Canada. While we give you above the names of a few who have used it, our best recommendation is for you to ask any person who has ever used any line we manufacture. 26

These goods may be obtained from, Halifax Seed Co., Halifax; Amherst Trading Co., Amherst; A. Horne & Co., Charlotte town; Maynes & Riley, St. John.

Has repeatedly defeated every animal placed above her. Would sell 6 months brother of this bull if preferred. Don't want both. L. I. FLOWER, Central Cambridge, N. B.

Green Goods Again.

Far be it from us to offer advice, but may we not make, in a quiet way, the startling and noble suggestion that it would be a good idea for everybody now to begin thinking about his garden? You don't need to be an expert to make your spare land a source of revenue. Neither do you have to know anything about botany to begin raising flowers. Your land is good enough for something, no matter how unpromising. If you can't do anything better, put a nickel's worth of Sunflower seed or Wild Cucumber between the ash barrel and the back fence. The watch results. If you once begin gardening, even in this modest way, you aren't likely ever to stop. From things needing no care you will go to others needing a little, and by and by, working in the garden, feeling the soft ground under your feet, getting the fresh frangance of the morning air, watching the little green shoots come up and develop seeing the brilliant colors take the place of the dirty browns and grays of winter, will be more fun than anything you have done since you were a boy.

There is a greater incentive for gardening now-a-days than ever before. Fresh produce costs more to buy and home gardens are better than they used to be. There are finer varieties of vegetables and flowers. It is within the memory of some of our readers that Sweet Corn and Celery and Tomatoes came to be generally known; and the flowers of today—how they have come into their own! Sweet Peas and Asters and Cosmos, Pansies, Giant Morning Glories, California Poppies and all the other Poppies, these and many more a generation ago were unknown in their present glory.

Think about it. Make your plans now. When ready to plant get seeds that have been proven by some tried seedman of national repute. Experienced gardeners buy only thoroughbred seeds: they don't waste their time on inferior or unknown quality. They depend on some old standby, some firm with large capital, experience and a reputation to maintain. But as we said to begin with—far be it from us to offer advice. We merely suggest that you do not let another springtime go by without being a part of it.

Potash.

Potash in Canadian agriculture is chiefly used in the forms of Muriate of Potash ana Sulphur of Potash. The former is the most generally used but Sulphate of Potash should invariably be used on potatoes, sugar beets and tobacco as the chlorine content in the Muriate of Potash is liable to have a detrimental effect on the quality of these crops.

It should be remembered that artificial fertilizers are not used up by the first crop. This does not apply to Nitrate of Soda or Sulphate of Ammonia, which are generally taken up wholly by the crop tp which they are applied. An application of Potash would be only half used up by the first crop and the two succeeding crops will benefit from the remainder. From this illustration it can be seen that a farmer ought not to charge the fall cost of his fertilizers to the first crop except in the case of the nitrogenous materials mentioned.

Each fertilizer material has its own functions to perform; no one ingredient can replace another.

Potash adds to the quality and promotes the maturity of crops in addition to increasing the quantity. It is necessary for the production and transfer of starch in plants, for the stiffening of straw; it gives color and flavor to fruit and adds to the size of roots and tubers. Potash should be the dominant ingredient of a fertilizer for potatoes.

Free, educative bulletins and advice on the Economic Purchase and Use of Artificial Fertilizers may be obtained by applying to German Potash Syndicate, 1505 I. O. F. Temple Bldg., Toronto.

Liming.

Liming plays a very important part in agriculture. Nearly all land needs liming sooner or later, some more than others. When land is manured heavily for several years, and not limed, it begins to get sour, crops fall off, and diseases appear. The best time in the rotation to apply lime is on lea. It should not be ploughed in, but spread on the furrows, and harrowed in. It will sink soon enough.

Lime is lost to the soil in various ways. Crops carry it away, it sinks, and is lost by drainage, as nitrates and chlorides. Roots take a very considerable amount of lime out of the soil.

It is very little use applying lime unless there is plenty of humus in the soil. Years ago farmers were under the impression that lime was a manure in itself, consequently much land was limed excessively. Now they go to the other extreme, and do not lime enough. Lime should never be brought into contact with farm-yard manure or any other manure containing ammonia, as it will drive off the ammonia.

It encourages the decomposition of organic matter, and renders it more available to the plant. It neutralizes organic acids, and thus sweetens the soil and improves the herbage. It assists in the liberation of potash, and aids in the production of nitrates. It opens up heavy clay soils and makes light ones more retentive. It helps to purify soils by rendering harmless salts of copper and iron, and it also acts as a fungicide and insecticide. The amount of lime to apply per acre varies with different soils. About the average quantity used is two tons and this can be recommended. On per acre every seven or eight years, pasture 20 to 25 cwts. every three or four years, and on newly-cultivated land from three to six tons is required. More lime is required on wet land than on dry. When lime is exposed to the air it absorbs carbon dioxide, and turns back into limestone again, therefore it should be spread as soon as possible.

HOMESTEAD FARM

Prescott Blanchard, Truro, N. S.

LET US SHOW YOU HOW EASILY YOU AND YOUR NEIGHBORS CAN HAVE A TELEPHONE SYSTEM OF YOUR OWN

YOU—you and your neighbors—would have a telephone system for your own community, if you only realized how easily you yourselves could construct it and get it going. If you knew, in detail, how you and the people around you could form, own and control a local, self-maintaining company, for your own use and convenience, you would have such a system. There would be a telephone system in your community to-day if you knew how easily you and your neighbors could build every foot of the line and install every instrument yourselves—and especially if you realized that you do not need very much capital to do it either. Now, there is no reason why you should not know all these facts; for we stand ready to give you, for the mere asking, every bit of this information, provided only that you are sufficiently interested in the subject to write and ask us for it.

The Northern Electric is the instrument on the wall of nine out of every ten telephone users in Canada.

We Send This Book **FREE** But Only On Request

"HOW to Build Rural Telephone Lines," is an illustrated, cloth bound book of one hundred pages, full of a carefully indexed mass of information on rural telephones. This book tells everything ; with it before you, you can organize your own company and construct your own line. It tells you absolutely everything you need to know, step by step, as you go along. There is no other book in existence that deals so thoroughly with every vital, essential fact. Remember, this book has cost a lot of money and careful study to prepare. We really ought to charge for it. However, we send it free on request—but ONLY on request. To get it you have to send us the coupon and thus signify that you are really interested. The book is too valuable to distribute haphazard.

We Will Explain All About Rural Company Organization

YOU do not need experience to organize a telephone company in your own community, when you have our book. It tells you exactly what you have to do and how to do it. All you need to do is to follow the instructions that the book gives and then get out and interest your neighbors. Whether you want to organize a mutual or a stock company, the book will tell you how.

You And Just Your Own Friends Can Build Every Foot Of Line

BUILDING your own line keeps down construction costs. With the help we give you, you do not need to employ expert linemen. The book explains the last word in line construction and contains, in this one chapter alone, thirty-seven diagrams and illustrations, showing how to make every kind of connection necessary, how to route the line, how to put the fittings on the poles, how to guy the poles, how to place the insulators and string the wires—in fact, how to handle every detail as well as an expert lineman can. On request, we will also tell you of your provincial regulations, what your government requires and what it will do to help you.

The Cost To Operate Your Own Line is Low

YOU can readily understand that when you and your friends have the entire management in your own hands, you can regulate the cost of running the line. In the book we explain just exactly what is necessary and you can take your pencil and figure out how little it will cost you to have a telephone on the wall in your own house.

Let Us Explain To You How To Interest Your Neighbors

THE first step in getting started, is to enthuse your neighbors and get them all in with you. When you have read "How to Build Rural Telephone Lines," you will have a mass of information at your finger ends that will enable you to place positive, definite facts before your friends, to enthuse them with the idea of a self-maintaining, community-owned system and to make everybody around you anxious to help. All it needs to get a telephone system started, is for some one progressive man to start the ball rolling. With the information that we will place at your command, you can get everything organized in short order.

There Will Be A Telephone System In Your Locality — Get Posted

SOONER or later someone is going to start a telephone system in your community, just as systems are being started every day in farming centres throughout the Dominion. When this subject comes up, you will want the full particulars before you. Now is the time for you to post yourself. The book tells you everything and, if you are interested, we will be glad to send it to you free. Do you care to sign the coupon and send it to us now?

DE LAVAL
CREAM SEPARATORS

Don't Delay Buying One A Single Day Longer

If you are selling cream or making butter and have no separator or are using an inferior machine, you are wasting cream every day you delay the purchase of a De Laval.

There can only be two real reasons why you should put off buying a De Laval; either you do not really appreciate how great your loss in dollars and cents actually is or else you do not believe the De Laval Cream Separator will make the saving claimed for it.

In either case there is one conclusive answer: "Let the De Laval agent in your locality set up a machine for you on your place and see for yourself what the De Laval will do."

You have nothing to risk and a million other cow owners who have made this test have found they had much to gain.

Don't wait till Spring. Even if you have only two or three cows in milk you can buy a De Laval now and save half its cost by Spring, and you can buy a De Laval machine for cash or on such liberal terms that it will actually pay for itself.

MOLASSINE
MOLASSINE HORSE FOOD
MOLASSINE CATTLE FOOD

Over 500,000 Tons or 25,000 carloads of MOLASSINE MEAL were sold last year

This was distributed over practically all of the world and the sale is still increasing.

In Canada, our sales within the last three months, have doubled. Farmers realize that if they can get Pure Cane Molasses, with the Potash Salts extracted from it, thus ridding it of it's purgative effect, into the stomach of their animals, results are bound to be forthcoming.

They also realize that when their Animals chew MOLASSINE MEAL, when mixed with other Feeds, on account of its being sweet, they always thoroughly masticate all of their Feeds. These two arguments alone are sufficient to have the most skeptical give this Feed a trial. Very few have not tried it. You may be one of the few. If so, buy it TO-DAY as all dealers handle it.

How a Former Nova Scotian Encourages the Boys

Furnished Cash For Turnip Growing Competition

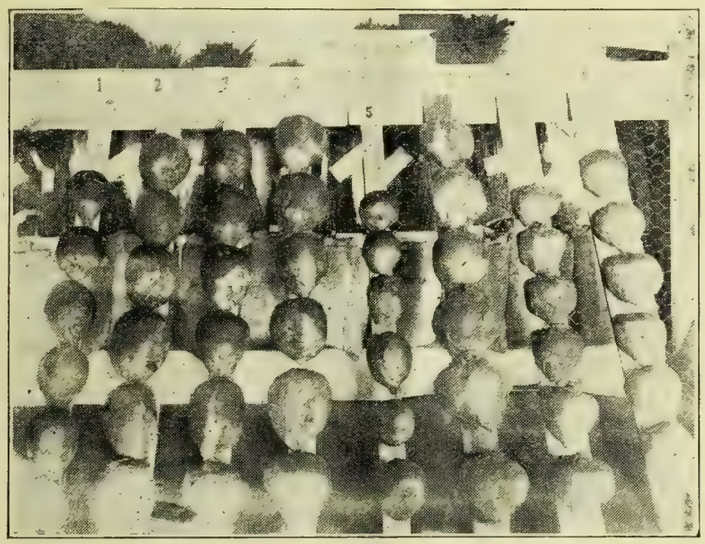
An Example Worthy of Emulation.

QUITE early in the old year we made reference in our columns to the generous donation of a former Nova Scotian for the purpose of encouraging the farm boys of his native district.

Following is an account of the proceedings by Prof. M. Cumming :

"I was born in Nova Scotia but am now living in New York. I have made a little money and I want to do something to help the boys on the farms down home. Can you assist me ?" So ran a letter received at the Nova Scotia Department of Agriculture about a year ago. The letter continued: "I have an idea myself that more cattle should be fed down East and if the farmers would grow more turnips they could feed more cattle cheaply. What would you think of a Turnip Growing Competition ?"

"Just the thing," we replied, and so it was arranged and a check covering the prize money and enough extra to pay for the advertising was deposited to the credit of the Turnip Growing Competition which was to be managed by Charles Hill, of Onslow; F. L. Fuller, of Truro, and the writer. "I want the competition confined to Colchester and Cumberland Counties and I do not want my name mentioned," was added.



Prize Winning Turnips at the Maritime Winter Fair.

Exhibit of turnips from the eight prize-winning fields in the Colchester and Cumberland Turnip Growing Competition.

And so the competitions were arranged. The prizes in each county were to be : First, $75.00; second, $50.00; third, $30.00; fourth, $20.00; four prizes in each county, making in all $350.00, to be given for the best one-acre of turnips grown by boys between fifteen and twenty years of age and living on farms not assessed at more than $3,000.00. Finally the prize money must be used for some such purpose as improving the farm, adding to the live stock, paying for an agricultural education, etc., the method to be agreed upon by the committee in charge. The donor was a business man and thought of almost every essential for a good competition, namely, substantial prize money to be spent for some permanent improvement eligible only to boys on the average farms of the country and the competition a practical one—such were the features.

Twenty-eight boys entered the competition, fifteen in Cumberland and thirteen in Colchester. All could not be successful and some had very hard luck. Cut worms spoiled the chances of some early in the season. Too much cold wet weather proved fatal to all who tried to grow their turnips on heavy or low undrained land and so on. But to show how good some of the fields were the five best averaged 1,210 bushels per acre and the highest scoring one produced 1,400 bushels.

Did you ever think how much feed a good acre of turnips will yield ? Consider the best one grown in this competition by Baxter Fulton, of Bass River. His yield was 1,400 bushels, equal to 42 tons. An acre covered with corn ten feet high (far above your head) will yield 20 tons of silage and it looks an enormous quantity. But this field yielded over twice that. Why, it would provide twenty cattle with forty pounds per day each of the very best succulent feed for three and a half months and along with straw and a little grain would produce more than treble the amount of beef raised on the average farm of the East.

According to the returns of the Census Statistics Division issued from Ottawa in December last, the total acreage in turnips in Canada was 227,141 acres and the average yield was 373.92 bushels, making a total of 84,933,000 bushels. Had these fields been brought up to the standard of the five best fields in this boy's competition (1,210 bushels) it would have amounted to 274,840,610 bushels, an increase of 169,907,610 bushels, worth ten cents per bushel, $16,990,761. Surely these boys, in their teens, who participated in this competition have taught Canada something.

Beauty's Bell—score 223.38. **Gipsy of Willow**—score 200.88.

Prize winning Guernseys in the 1912 Maritime Winter Fair Dairy Test. Note the well balanced udders and tortuous milk veins. Owned and exhibited by Hugh A. Dickson, Onslow, N. S.

WHAT DID THEY LEARN ?

And what of the boys who did not win a prize and what of the mistakes made ? One said : "I bet I will win next time." "I have taken a better piece of land, better drained and it is in better shape now." Several voiced his sentiments. One boy's father said : "Well, we did not win but we grew the best field of turnips we ever grew and we learned enough to grow a better crop next year." Another boy coaxed his father to put on too much barnyard manure and he grew too much tops and too many coarse necky, split and hollow turnips. Next year he will use less barnyard manure and add a

little mineral fertilizer containing some phosphoric acid and potash. That's what the boys did whose fields produced the best quality along with quantity. Several bought cheap seed. It was the best the storekeeper had. But next year they will use what the winners used—the best grade of turnip seed, and if the storekeeper will not get that kind, they will order it by mail. Some had their rows too far apart and lost in yield per acre. Twenty-eight inches between the rows and the plants from twelve to fourteen inches in the row gave the maximum results. Early seeded fields generally surpassed the late ones. Those sown between May 20th and June 1st in general, scoring the highest.

EXHIBITED AT WINTER FAIR.

Turnips from the exhibit prize winning fields were exhibited at the Maritime Winter Fair. The awards there did not quite agree with the awards in the field for the reason that the selection counted and the product at Amherst did not represent the averl age of the field, all of which snows that it is the Field Competition that is the practical one.

And what are the boys planning to do with their money? That is not decided but here are some of their requests. One wants to buy pure-bred sheep and hopes with the profits to help pay for an agricultural education. Another has his eye on a pure bred Holstein heifer. Another wants to clear, this winter, a field to the rear of his father's farm and grow more turnips. Another wants a half interest in a manure-spreader. Another hopes to pipe water from a spring into the house and so make home more comfortable for mother. The horseman of the lot wants to buy a pure-bred filly. And still another wants to improve the stable for his cows.

The donor of this gift has certainly had the satisfaction of having accomplished something tangible for his that they are trying to figure out how to get other competitions of the same sort started elsewhere in the province.
have been so heartily participated in. It was a splendid patriotic investment and the Department of Agriculture are so pleased with the result native province. Few competitions have been so talked about and few

Steps That Have Been Taken in an Endeavour to Secure Cheaper Ditching Machines, and Thus Lead to Their More General Introduction Into Canada

1. Four years ago the firm making traction ditchers in the United States was approached with a view to having them establish a factory in Canada. They sent their Secretary-treasurer and later a committee consisting of their President, Vice-President and Sales Manager to investigate, but took no action. Apparently they came to the same conclusion as the Canadian Manufacturers Association (see Mr. Breadner's letter farther on), viz., that "the number of ditchers required in Canada would not warrant a factory starting to build them as a speciality." This conclusion is borne out by the fact that in the three years 1909-'10-'11 the total number of these machines imported into Canada was only 35, of an average of 12 machines a year.

On several occasions the proposition has been discussed with Canadian manufacturers and Capitalists, the same conclusion being reached by all of them.

During these negotiations a situation not anticipated was forcibly brought into prominence: The United States makers, and every Canadian capitalist or manufacturer with whom the situation was discussed, in estimating the probable profits, determined the selling price in Canada of a Canadian made ditcher by adding the duty to the United States selling price, since they would have no competition. Under those conditions the establishing of a factory in Canada would not have cheapened the machines to any appreciable extent.

2. When it seemed for the present and some considerable time to come we were unlikely to have ditchers manufactured in Canada an effort was begun to have the duty on these machines removed.

When his attention was brought to the matter Mr. C. C. James enlisted the sympathy and assistance of the Hon. Clifford Sifton of the Commission of Conservation.

Prof. M. Cumming of Truro, Nova Scotia, was also interested and through him Premier Murray and Sir Frederick Borden.

In the meantime a memorial entitled "Statement re Duty on Ditching Machines," copy hereto attached, was prepared and transmitted to the Ministers of Customs, Agriculture and Finance in the late Government, and most of the prominent men who had become interested made personal representations to the departments mentioned.

Meanwhile also the Canadian Manufacturers Association was furnished with a copy of the memorial and some of the manufacturers of tile making machinery urged the Association to support the movement for duty free ditching machines. Their reply is contained in Mr. R. W. Breadner's letter of March 7th 1911.

On October 28th. 1911, a month after the general election the matter was laid before the Ministers of Customs, Agriculture and Finance in the new Government.

By this time several members of the Dominion House had become interest-through their constituents and some of them made representations to the Government.

In October 1912 several Farmer's Organizations passed resolutions asking that the duty on ditching machines be removed. One association asked for a suggestive resolution, which was drawn up and sent to them.

In December 1912, Mr. McCoig gave notice in the House of his resolution declaring that ditching machines should be placed an the free list.

Since the foregoing was dictated word has been received that the Canadian Manufacturers Association has again considered the matter and this time they decided that they "will recommend the removal of the duty"—their former stand was that they would "not oppose the proposition."

Toronto, 7th, March, 1911.

W. H. Day, Esq., B. A.
Professor of Physics O. A. C.
Guelph, Ont.

Dear Sir:—

With further reference to our correspondence respecting traction ditching machines being placed on the tariff free list, I may state that this question was submitted to the tariff Committee at a meeting held on the 15th ultimo, and was transferred by the Committee to the Executive Council for consideration. I am pleased to advise you that so far as this Association is concerned the proposition will not be opposed.

When I was in Ottawa last week I advised the Commissioner of Customs that traction ditching machines were not made in Canada, also that the number required in Canada would not warrant any factory starting to build them as a specialty; therefore it would not be detrimental to any Canadian industry if they were made free of duty. This information was corroborated by copies of letters from manufacturers which I mailed to the Honourable the Minister of Customs. I trust this will meet with your approval.

Yours faithfully,
(Signed)
R. W. Breadner,
Mngr. Tariff Dept.

STATEMENT RE THE DUTY ON DITCHING MACHINES

First:—It has been demonstrated that wet lands when underdrained produce annually increased crops to the value of $20 to $40 per acre, that in many ordinary farm lands drainage will give crop increases valued at from $10 to $20 per acre, that according to carefully complied reports the average increase due to underdrainage is a shade over $20 per acre.

Second:—That in "Old" Ontario alone some 4,000,000 acres of ordinary lands are in urgent need of underdrainage; also that there are today in the same province no less than 5,000,000 acres of slash, swamp, marsh, and waste lands now comparatively useless but most of which may be reclaimed by underdrainage. If then a conservative estimate allows that 3,000,000 acres may be reclaimed, which if reclaimed would add $60,000,000 to the earnings of the farmers of the Province of Ontario, this added to the increased crops from the drainage of lands now under tillage, would mean a total increase exceeding $100,000,000 per year. This vast increase would materially benefit all classes of citizens in the Province.

Third:—That which underdrainage will do for the Province of Ontario it will also do, to a lesser or greater extent, for all the other provinces.

Fourth:—To secure underdrainage two and only two requisites are necessary, tile and labour on the farm. Tiles are being manufactured in Ontario at a rate that has increased from 15,000,000 in 1905 to 35,000,000 in 1910. Clay from which tile are made is found in nearly every township, but certainly in every county. The plant necessary for the manufacture of tile is inexpensive and can be quickly procured. This manufacture employs considerable labour—their are 213 tile yards in Ontario alone—its expansion would be the means of finding steady employment for more labour, and therefore such expansion would be to the benefit of Canada. The same applies to the manufacture of tile machinery. Tile or tile machinery will not be purchased unless labour can be secured for the making of the necessary trenches in which the tile are to be placed by the farmer. The digging of those trenches is very arduous labour, and has to be undertaken just at that time of the year when farm labour, in Canada, is most in demand for regular farm work of a less arduous description. Under those conditions it is often impossible to hire labour for digging the trenches.

Fifth.—The traction ditcher obviates this trouble. A couple of men with one ditcher, neither of whom has unusually hard work, can dig as many trenches in one day as twenty men by hand.

Sixth:—No Traction Ditchers are manufactured in Canada.

Seventh:—Owing to the fact that these machines can do an enormous amount of work the total number of ditchers required will not for a long time to come be such as would warrant the commencement of their manufacture in Canada.

Eighth:—The number of Canadians who might be employed in the manufacture of these ditchers would be less than the number of men who would be employed in producing the increased number of tile required owing to the use of the ditchers, and less likewise than the number that would be employed in building the extra tile-making machinery that would be required.

Ninth:—It is admitted in Europe that the underdrainage of land has a marked effect upon the health of human beings—an especially beneficial effect upon that dread disease, consumption. It is therefore of material importance that everything that may be possible should be done to encourage underdrainage.

All that now seems to be required, in order to secure the quick underdrainage of large areas of land, is the extensive employment of ditching machines, but the high rate of duty is preventing their introduction—already several men considering the purchase of a machine have abandoned the project on account of the duty.

Therefore for all these several reasons and for others not herein given, which are nearly as important, the Government is respectfully requested and urged to place this special machine known as the traction ditcher and parts thereof upon the Free List, and the request is made with the more confidence because the Government in granting it would be making no new departure, but would be doing for agriculture, for the Tile Making Industry and for the Manufacture of Tile Machinery, that which the Government has on several occasions done for one or more of the different sections of the Manufacturing Industry.

RESOLUTION THAT AGRICULTURE BODIES MAY SEND THEIR REPRESENTATIVES

Moved by ....
SECONDED by .... that

WHEREAS large areas of land in this vicinity are in urgent need of underdrainage.

AND WHEREAS we as farmers have this year, and for many years, lost heavily by portions of our farms being too wet.

AND WHEREAS owing to the scarcity of hand labour it is practically impossible for us to secure help to lay the drains.

AND WHEREAS the traction ditcher if introduced into this locality would solve the difficulty.

AND WHEREAS traction ditchers are not manufactured in Canada.

AND WHEREAS the duty, which is 27½ per cent, amounts to from $500 to $750 on a machine suitable for this locality, depending on size of machine.

AND WHEREAS a sum of this magnitude in addition to the cash payment on this machine is prohibitive to many men considering the purchase of one of those machines.

AND WHEREAS this prohibition is a direct monotary loss to us as we are unable to get our drains put in.

AND WHERE AS the late manager of the Tariff Committee af the Canadian Manufacturers Association has stated that the number of those machines required in Canada would not warrant any factory starting to build them as a specialty, and therefore it

would not be detrimental to any Canadian industry if they were made free of duty, and that therefore the said Manufacturers Association will not oppose the removal of the duty.

THEREFORE be it resolved: That we members of ....at .....

(Name of society). (Post Office) in the Township of ..... County of... in meeting assembled, hereby place ourselves on record emphatically and unanimously as favoring the removal of the duty from traction ditchers and parts thereof.

That we hereby respectfully urge upon the Honourable the Minister of Customs that the said duty be removed at as early a date as possible.

And further, that the Honourable the Minister of Agriculture for the Dominion be hereby respectfully asked to support the suggestion for the removal of the said duty.

And further, that the member of Parliament for this riding be hereby respectlully asked to use his best endeavours to secure the removal of the said duty.

And that the Secretary be hereby instructed to send copies of this resolution to the Honourable the Min... ...toms, Agriculture and Finance at Ottawa, and the member of the Dominion Parliament for this riding.

Of What Good is Humus.

It was with a hope of answering a part of that question that Bulletin 128 of the Minnesota Agricultural Experiment Station, St. Paul, was published. While the bulletin is classed as "technical" or scientific it has much of value in it for the reading farmer.

There is no subject on which "the doctors" disagree so much as that of humus. They do not even agree as to what it really is. The agronomist think of one thing, the chemist of another. But they all agree that humus comes from organic matter and is a complex chemical compound. For all practical purposes we can use the term organic matter and express ourselves so far as the action of manures on plant growth is concerned. Here, however, we will use the term humus to be consistent with the bulletin, which uses that term.

The author of the bulletin, George W. Walker, tells of experiments performed to determine what relation humus in soils bears to the kind of rotation followed, and what, if any, changes occur in the humus plant foods when land is cropped in different ways. In other words, what is the difference between continuous cropping of soils and rotating of soils so far as the humus is concerned. The field tests extend over a period of ten years.

The conclusions which are several bring out some very significant and interesting points. A few of them follow:

1. "Generally, rotation of crops increases the amount of humus, the increase being greatest when clover is plowed under.."

This is not a new idea at all but it points toward a verification of the statement that one of the best ways to increase the fertility of average soils is to grow clover and plow under the second crop.

2. Except in the case of wheat, no marked decrease in total phosphoric acid has occurred in the continuously cropped plots."

This is rather novel. The results came as a surprise to the investigators. Likewise they state that "generally, under systems of crop rotation, the plots have maintained the total phosphoric acid content for the ten-year period." This is contrary to many experiments which have been conducted in other states. The author himself does not place a great deal of emphasis on these results because of the fact that the number of soil samples was limited and that the period of test extended over but ten years.

3. He does lay emphasis on another point which, to his mind, the experiments practically point out.

"The relatively large proportions of nitrogen, phosphoric acid, and potash associated with the humus indicate the great importance and value of the latter as a source of plant food."

In other words, we need to realize the value manure (both barnyard and green) has for the soil in supplying the elements for plant growth. True it supplies much more than it benefits the physical condition of the soil, but the author of the bulletin would say, "Grow green manure crops, add manure to your soils, for these results show us the importance and value of humus as a source of plant food."

But even then the reader of this bulletin is not satisfied in his own mind as to exactly what the statements mean. The stated conclusions say that "rotation of crops increases the amount of humus," that "under systems of crop rotation the plots have maintained the total phosphoric acid content for the ten-year period," and that humus is of great value as a source of plant food. In other words, by rotating crops the humus is increased and consequently the phosphoric acid maintained. Our query is, "Where does that phosphoric acid come from?"

We can see how the nitrogen might increase and likewise the carbon, but as for the phosphoric acid and potash we are in darkness. It is possible, perhaps, that the manure applied balanced the loss of phosphoric acid and potash but the writer seems to credit the system of rotation with that work. In the meantime we will continue to buy raw rock phosphate and apply it with the manure, for we know that that is a means of increased profits on Hoard's Dairy farm. Perhaps soon the chemical tangle will be straightened and we will be clear in our minds as to what really took place on these Minnesota plots.—Hoara's Dairyman.

SOWING GOOD SEED

One of the best evidences of the results of sowing good seed is to be found among the farmers who have been carefully germinating the seed of information that the agricultural colleges, experiment stations and other sources of distribution have been so liberally passing out to the people. The seeds of knowledge, information as to the right and wrong methods of handling the crop and farm work, has been falling upon fertile soil in the brain of the intelligent farmer, and the evidences are now everywhere apparent in a better understanding of how to do things. The experiment stations are sometimes criticised for spending too much time in finding out that certain things are a failure, that it does not pay to do things in a certain way at certain times.

It is just as important to learn what not to do as to learn what to do. This is a fast age; man cannot afford to experiment on failures; it is enough to know that some good authority tried it and proved it a failure. The ordinary observing business man is steering clear of other men's failures, because he knows that life is too short to take chances in the uncertain things when he has a sure thing in plain view. Thus it may be observed that improved agriculture is moving along now at a rapid pace, just because we have had these agencies of education employed in going in advance and blazing the way that we may proceed intelligently, doing things as directed and keeping clear of the mistakes and pitfalls that otherwise we would plunge into.

It is quite frequently remarked, "Did you ever see such a stand of oats as is all over the country this year; almost every grain seemed to be of good germinating quality?" Now there is nothing wonderful about this most any year, since the farmer has learned how to select his seed oats, how to test its germinating qualities, how to prepare his seed and how to plant to get a good stand. It is now a question of good seed with the farmer first, then he must be shown, and his final evidence is his own test. The farmer of today who is conducting his affairs successfully is not the farmer of forty years ago, or twenty years ago. The progress that is being made on the farm of the twentieth century is rapid; it takes a live, active, thinking man to keep up to the procession.

In this text of sowing good seed it is only necessary to look around and see how uniformly the agricultural colleges are engaged in the work of teaching the benefits of better seed in all crops grown and produced on the farm for field or commercial advantage. No farmer is complete in his preparation to do satisfactory work on his farm who is not supplied with the latest and best improvements to assist in the preparation of seed for sowing and planting. The seed grader, seed cleaner and seed tester have become necessities in the successful operation of crop-growing.

A practical machine or implement for the performance of special work on the farm is not an extravagance or waste if properly handled and properly cared for. It is not every farmer who buys machines that appreciates or understands the care the machine demands when not in use. Each machine sold should have printed instructions accompanying it, defining how it should be taken care of in order to get best results of work and wear. This is a good time for the farmer to study his needs in the matter of good, clean seed and provide himself with this class of machinery in advance of next spring's work.

The Maritime Farmer,

Sussex, N. B.,

Dear Sirs,

I did not realize my subscription had expired until I recd. your bill which has been mislaid. I am sending herewith express order for $1.60 to cover two years subscription, as I would not like to be without your paper, which FOR AN ALL ROUND FARMERS PAPER is easily first, although I take several.

Yours very truly,

W. E. READ.

Bear River, N. S.,
January 9th, 1913.

ENCOURAGEMENT OF THE SEED INDUSTRY.

Thirty thousand dollars was set apart last year to reimburse the provincial departments of agriculture for approximately half the cost of organizing and conducting seed fairs, provincial seed exhibitions and field crop competitions according to the Census and Statistics Monthly. All who know the advantages of using good seed realize the value of these organizations in the improvement of field and garden crops. The new and superior strains of seed produced at experiment stations may be increased in quantity by farmers who make a specialty of growing registered seed under the supervision of the Canadian Seed Growers' Association. Such registered seed is much in demand by farmers who compete in field crop competitions. The product of their crops, though not eligible for registration, ultimately becomes disseminated, either directly or through seed fairs, among the less progressive farmers in the locality.

Experience has shown that the expenses for advertising and for judges at seed fairs and field crop competitions amount on the average to about $25 for each organization---frequently less for seed fairs and sometimes more for field crop competitions where judges are required to travel long distances. Either of these organizations is well provided for when the prize list amounts to $75, making a total expenditure of approximately $100. Under the new plan of reimbursing the provincial departments of agriculture by money subventions, on receipt of certified statement showing the amount of work done and the total amount expended in cash prizes to seed growers, a check for two-thirds of that amount is iussed to the department which conducted the competitions. Such subventions, however, must not exceed $50 for each field crop competition (allowing competitions in three kinds), and $400 for a provincial seed exhibition. Any province with less than a million acres in field crops may receive an amount up to but not exceeding $1000. For any province having more than a million acres under cultivation in field crops the amount of the subvention is increased pro rata, $1000 for each million acres.

The total area under field crops, as is how by the unrevised census, returns for 1911, and the amount of the subvention each province may be able to earn on account of this educational work for the improvement of field crops is as follows:

Prince Edward Island, area under field crops, 465,765 acres; total subvention available, $1000.

Nova Scotia, area under field crops, 573,040; total subvention available, $1000.

New Brunswick, area under field crops, 918,057; total subvention available, $1000.

Quebec, area under field crops, 5,164,487; total subvention available, $5165.

Ontario, area under field crops, 9,473,240; total subventsion available, $9473.

Manitoba, area under field crops, 4,932,032; total subvention available, $4932.

Saskatchewan, area under field crops, 8,006,421; total subvention available, $8006.

Alberta, area under field crops, 3,277,006; total subvention available, $3277.

British Columbia, area under field crops, 43,024; total subvention available, $1000.

ONE GREAT NEED.

If one has one hobby more than another in connection with the advancement of the business of agriculture, it should be the improvement of that end of the business which has to do with the distribution of the products of the farm to the consumers so as to make farming more profitable for the people who are actually engaged in the business.

No one who is interested in the progress and improvement of this great business can have the slightest objection to the efforts of any institution, organization or individual to encourage the adoption of any methods or practices by which such improvement can be brought about and through which such progress will be made.

It is the implied imputation that farming is so much behind any other business that it needs the assistance and encouragement of other and outside interests to bring it up where the people's bread and butter will be safe, that is objected to. It is the oft-repeated assertion that farmers are a hundred years behind the times; that they need to be taught to adopt modern methods of growing crops, and that they ought to finance their farming operations; these libels, direct and insinuated, are not calculated to help the farming business. Any assistance in broadening and spreading the influence of the progressive work that is being done will be welcomed by every lover of the farm, but nothing can be gained by raising up a bogey man in order to show how he may be frightened away, not by exaggerating the evils of present conditions or belittling the progress that has already been made.

Growth and Selection of Seed Potatoes

No variety of farm crop deteriorates or becomes worn out more quickly than the potato. The profitable life of any variety, however good it may be, is, at the most, nine or ten years. For this there are several reasons. Disease is a formidable item to which every variety, no matter how robust it may have been on its introduction, falls a victim sooner or later; no absolute disease-proof potato ever has, and never will be, brought out.

Loss of vogor and initial disease-resisting properties are undoubtedly hastened by the methods of culture employed. I have frequently seen two growers start level, as it were, with a certain variety; A finds that with him the sort becomes unprofitable much sooner than it does with B. Let us see how this may come about. Too close planting of sets, the use of too small tubers for seed, and the harvesting of the crop before it is ripe, are methods which tend to early deterioration.

Potatoes grown for seed should receive more carefal attention than is bestowed upon the main crop, and it may be well to direct attention to a few weak points in the cultivation of this important crop which should be carefully avoided in growing for seed purposes.

Potatoes reserved for seed should be perfectly ripe before being lifted, and when taken out of storage in spring, any that are spotted with disease, dry rot or mould, or are unsound or misshapen should be rejected. The seed tubers should not have too many eyes, as they produce a number of undesirable stems, preventing the free access of light and air to the plants. In experimental work I have noticed that those sets which produced few stems only yielded larger-sized tubers, and although the number per root might not be so large, yet the weight of the produce of such a set compared favorably with those which produced a larger number but smaller tubers. Many persons who grow for exhibition use as seed, whole potatoes of medium size, from which all but three or four eyes are carefully cut out before planting; others, too, cut out the stems from the plant if too numerous, but such mutilation when full growth is in progress is not desirable. Large potatoes may be cut into pieces, and, in general, it is correct to say they should be cut in direction of their length, and with an even distribution of the eyes on the cut parts.

The distance at which the sets should be placed from each other is a matter of great importance, but no rule can be laid down that will apply in every case. The vigor and development of the variety, the season, soil and manuring, have all to be taken into account. It must not be forgotten that free circulation of air between the plants renders the crop less liable to disease. There is a limit in close planting and wide planting, by going beyond which the yield of the same area will be comparatively diminished. In raising the main crop for market purposes it must be taken as a rule that close planting within modern limits, is best for large yields, but for the production of good seed it is desirable to plant as wide as economy permits.

The importance of absolute soundness in seed potatoes cannot be overestimated, and nearly every season affords good examples of this. We have all seen numerous instanres in which apparently sound and firm potatoes either rotted badly after planting, or, at best, threw up a single, weak, spindly stem. In some cases the seed makes no growth whatever, and, when dug up some weeks after setting, is in exactly the same condition as when planted. When ever disease is very prevalent, it may be taken as a certainty that much of seed stock available for use the following spring will be of very low vitality. Now, when it is suspected that the seed is of low vitality and no other can be obtained special treatment is required. Seed of this kind should be kept in an absolutely dormant condition until the time of planting. This will seem a reasonable statement, for if the weak seed is allowed to sprout and the shoots are rubbed off, its energy is further lowered, and it has not strength enough to make a decent above-ground growth. Another point to bear in mind in cutting seed potatoes—the cause of much seed rotting after planting is due to cutting with a heavy, thick-bladed knife; the remedy is to use a sharp, thin blade in cutting seed stock, handle carefully, and avoid exposure of the same to sun or wind.

The next point to which I would draw attention, and one which is more especially opportune, is the method of selecting the potatoes which are to be kept over for seed. Where a special growth for seed purposes is not made, a common practise is to riddle out potatoes not of marketable size and to save them for next year's crop. These tubers are of course, of small size, and although I quite admit that choice quality produce may be raised from small seed, the fact that this is so often deceives many as to the true value of small seed.

From experiment and observation, I have noted that small tubers may be divided into two classes; the one has plenty of vigor, but has been set too late to attain full growth; the other includes all the unfortunates of the crop—those whose vitality is weak and impaired. The first class makes fairly good seed, only, as a rule, they have too many eyes. The second kind are obtained from plants where, when dug, yield but six or eight little tubers, all under market size; neighboring roots may yield the same number of good-sized tubers, and there is no apparent cause for the diminutive size of the others. Lack of vitality, however, is evident, and in the usual way these six or eight weaklings would go into the lot reserved for seed, and cause disappointment in six or eight roots next year. From these facts I conclude that the indiscrimin. ate use of "seconds" for seed is inadvisable, causing a risk which it is as well not to run.

An expert may be able to tell these "run-out" tubers, by their shape. In kidney varieties they are slender, and in rounds the tendency is to form a pointed seed end, thickly studded with eye. But who watches for these little points?

When taking up potatoes in the field and selecting seed therefrom, the best way is to mark the good-yielding plants, and to choose from these, but to draw the seed supply from the heaps into which all the under-sized tubers grown on the field are placed, is a method which cannot but lead to deterioration.—C. G. Freer in Maine Farmer.

Taking Care of Farm Implements

The care of farm machinery may be treated under three heads: First, housing or protecting from the weather; second, repairing; third, painting.

Housing.—On the average 160 acre farm there will be needed an equipment which will cost at least $1,000. Let this stand out during each winter and it will not do good work for five years. If well housed, every tool will do good work for from 10 to 15 years,or longer. An implement shed to house all these implements can be built for $200. If a $200 shed will double or treble the life of machinery costing $1,000, it is a splendid investment.

Repairing.—Repairs should be systematically made in order to have the machines ready for use at the time wanted. It is a good plan, when putting the machines away, to make a note of what is needed in the way of repairs. This note may be attached to the implement. If repairs are needed which must come from the factory, NOW is the time to let the local agent know, so that they can be obtained in time.

The question as to how far to undertake to do repair work on the farm will depend largely upon the personality of the farmer himself and his ability to handle tools and execute the work. With a little training and practice, he can repair all ordinary injuries to the farm equipment, and, as a rule, in less time than it would require to go to the blacksmith shop.

The taking apart of machinery should be avoided, except in cases where it is absolutely necessary to do so. The binder and mower and machines of this class are securely put together in the factory, and if taken apart it is difficult to restore them to their proper adjustments. There are, however, many minor repairs which the farmer can make himself.

Painting.—This is an age when appearances count for much, and a farmer's standing in the community is often governed by the appearance of his farm equipment. Paint not only adds to the appearance of an implement, but acts as a preservative to many of the parts, especially if they are made of wood. Always have the surface dry and clean before applying the paint.... As a rule, hand-mixed paints are the best. A good metallic paint may be made by mixing red lead and raw linseed oil.

The use of tools on the farm is of great value as an educational feature, especially when the work is carefully performed. The boys should be encouraged to use tools, and held responsible for their care and the character of the work performed. The tool outfit will be of special service in keeping the boy employed and interested, and contented to remain at home.—F. C. N.

About Feed Grinding

It frequently happens that the advertising matter sent out by the manufacturers of agricultural and farm implements and machines contains good suggestions for the farmer. In some cases statements are made with which we do not agree, but we all know that there is still necessarily a great difference of opinion about many matters agricultural. Thus we find in some matter recently sent out by manufacturers of grinding mills, the following suggestions among others:

"It has been frequently found that where ear corn is fed to fattening steers, the droppings from one animal alone contain enough food value to sustain two hogs. This is an unnecessary drain on the animal, a waste of food, and a disgusting manner of feeding hogs, which some farmers have been known to do.

"Regardless of what animals you are feeding, remember that food, to be digested, must first be reduced to a liquified form. The nutritive value of food must be assimilated into the system through the red and white corpuscles of the blood before it becomes a living substance in the animal, and this can be accomplished only after the food is converted into liquid form.

"The grinding of food for animals is not only a great economy of food, value from the food it consumes. Therefore, if nature's first act is to grind and masticate food, why not assist the process by grinding the food before it reaches the animal? This insures a better digestion, and certainly makes a surety that all the food the animal consumes will properly allow the digestive organs to assimiate life from it, thus overcoming the bad features caused by animals bolting their food.

"Every farmer should have a good feed grinder. The most valuable kind is one that will grind wet grain as well as dry. Its saving in feed and increased value of stock pays back its cost many times over."

Erroneous Ideas About Soil Analysis

The idea that many people have, that a chemical analysis of soils will show just how to treat land to increase crop production, is erroneous, according to Professor F. E. Bear, of the Ohio College of Agriculture. "To the average farmer a chemical analysis of soil means nothing, and it is a waste of time and a needless expense,"says Professor Bear. "Two soils may have the same analysis chemically and still give different returns in crop yields. The chemist can determine the total amount of the plant food elements in the soil, but he cannot tell how much of this is available for plant use.

"There are many conditions, other than plant food content, that must be taken into consideration in increasing crop production. The experienced soil chemist by knowing these conditions, can often give much helpful advice without making no actual analysis. A personal visit to the chemist by the farmer seeking information is always advisable." That there is a place for the chemical analysis of soils, Professor Bear believes but it requires a knowledge of chemistry to interpret it.

Curing Swale Hay

I have seen so much spoiled swale hay that I think a few words of counsel will not be out of place. It is a common mistake with farmers to think they must secure their best grass first. If anything must stand too long, let it be the upland grass. I cut my swales before they are fully grown, and never put it in the barn until it is thoroughly dried. When well cured, I would try to find a place to put it where it would not come out first or last. Would like to get it when I want it.

Don't think you must put it in the barn if not made quite enough because it looks likely to rain to morrow. Spend the time required to load and get in the hay in cocking it nice, and risk it. When I feed out hay made in this way, the stock knows no difference between that and the best English hay. It looks green and smells sweet. It doesn't hurt the upland grass to stand too long as bad as it does swale grass.—M. Campbell, in Maine Farmer.

How to Thresh Out Clover Seeds

The following arrangement of the common grain thresher to enable it to thresh out clover seed is suggested and described by Mr. John Fixter of the Conservation Commission:

To thresh out clover seed it is necessary to run the clover through the grain thresher as is done with grain. The short clover material will pass through the full length of the cylinder. This is done by placing a strong board or a piece of sheet iron directly behind the cylinder, leaving nine inches open at one end to prevent the chaff from going through. Also arrange a board in front of the cylinder, leaving the opposite end open; this will make the clover material pass the full length.

It is necessary to put sheets of sheet iron upon the concaves to prevent the seed from going through, and by having the machine so arranged the seed can be perfectly hulled.

HORTICULTURE.

Care is Needed in Planting Trees.

How many attempts at planting shade or ornamental trees have been failures, in whole or in part, and how many times is the tree planter at a loss to understand the cause of his failure? The following discussion by Dr. B. A. Fernow, Dean of the Faculty of Forestry, University of Toronto, will throw much light on this problem, and should assist many who will plant trees next spring or fall.

The first cause of trouble and of death in transplanted trees is not unfrequently to be found in the ignorance and lack of care exhibited before and during transplanting. Many trees set out are dead or are doomed to death before they reach the plant hole. Transplanting a tree from one side to another is a surgical operation during which the patient needs special attention.

FEEDING SYSTEM IMPAIRED

It is rarely, if at all, possible to take up all the fine rootlets with their root-hairs intact; these adhere closely to the soil particles, hence, in the attempt to remove them, a portion of the feeding apparatus is always mechanically destroyed. Next, the delicate root-hairs, and fibrils are not apt to dry out when exposed to the air, especially in windy, sunny, dry weather, and thus another portion of the feeding apparatus is lost. Lastly, with larger specimens, the far-lying roots can practically not be reached and a third portion of the root system is cut off. Furthermore, if the plant material is shipped any distance, the vital activities are interrupted, temperature and moisture conditions may be unfavorable during transhipment, and a partial dry. ing out of roots, buds, or foliage is the consequence.

As a result of these losses, the balance between crown and root, between consumption and supply of water, is disturbed, and, unless this balance is at once re-established by pruning at the top and by favourable conditions for replacement of lost parts at the root, a part of the crown must die.

HOW TO TRANSPLANT TREES

This trouble may be nearly or entirely avoided by transplanting with a ball of earth, when the root system is not at all disturbed. This is usually practicable only with small trees; as a rule, transplanting is done with the naked roots. Care should then be had to take up as much as practicable of the root system, keeping it intact, using a fork rather than a spade, and keeping in mind that the root tips are the important part, then the roots should be immediately protected against drying out by covering with moist soil, wet bagging, moss, etc., and be kept moist until the tree is reset.

If it has not been possible to secure the entire root system practically intact, then a proportionate amount of the crown system should also be removed by cutting back branches, using at the same time the opportunity for correcting the farm. This pruning is best done before setting the tree, or, more conventiently, at once after setting while the knowledge of the conditions of the root system is still fresh in mind. If it is neglected parts of the crown will die, and these may not be the parts we are willing to spare. It does not matter much if the pruning at the top is more severe than necessary; sparing the knife unduly matters much more.

Nursery stock, when received, should be opened at once in a shady cool place and the root packing examined. If it is dry and hot, the chance of securing a living plant is small. Nevertheless, by proper treatment, plants may sometimes be resuscitated; some species especially will stand a good deal of maltreatment and are able to recover. "Heeling" them in deeply in a trench under shade and in fresh soil, and drenching them thoroughly with water, keeping them drenched for a day or two, or even keeping them entirely submerged under water may restore what appeared quite hopeless material. Even if the leaves of conifers have suffered, so long as the buds are still fresh looking, the case is not quite hopeless provided proper care is applied in keeping roots and tips moist, and, especially, if rainy weather sets in.—C. L.

New Brunswick Apples in Montreal.

The New Brunswick Department of Agriculture has attempted a new feature in advertising the fruit growing possibilities of that province this year. A splendid window display of apples grown in the St. John River Valley and other parts of New Brunswick, is now on view at 757 St. Cathrine St., West, Montreal where a store has been rented for the purpose by the Department. Twenty-five boxes of McIntosh Reds, Fameuse and Yellow Bellefleur are shown in the window and are of a size and quality that cannot be excelled on Montreal Island, the home of the Fameuse, and where, it is claimed, the McIntosh Red grows to perfection. In the store proper are a dozen more boxes of Fameuse and a number of boxes of King of Tompkins and Merits, while on the counters are display cones and plates of McIntosh and Fameuse.

Mr. R. P. Gorham, Assistant Horticulturist of the Province of New Brunswick is in charge of the exhibit and is assisted by Mr. J. H. Ross and Mr. Kenneth Emberly of Macdonald College.

Literature descriptive of the fruit growing possibilities of the province is distributed and full information given on orchard planting and management.

The exhibit is attracting a great deal of attention and favorable comment. It opened on Dec. 28th, 1912 and was to close on Jan. 11th but so great was the interest manifested by the public that the Department decided to continue for a week longer.

Fruit growing in New Brunswick has gone ahead very rapidly during the last two years and promises to become one of the chief industries of the province. Nearly 60,000 apple trees were planted in 192, and the nomber of orders already placed for spring delivery indicates that an even larger number will be set in 1913. The McIntosh Red, Fameuse and Bethel are being most largely planted as these varieties seem to attain their greatest perfection in New Brunswick and command the best prices on the market.

Orchard and Garden.

The lime-sulphur wash developed from a solution which was used in California as a sheep dip. A number of years of experiments changed this first formula considerably, and it was not until 1906 that the formula for home-made lime-sulphur most generally used at present was worked out. This formula is as follows: Lime, 15 pounds; sulphur, 15 pounds; water, 50 gallons.

While experiments were being conducted to establish a standard home-made lime-sulphur solution, the scale was spreading rapidly. As a result of this general spread, large quantities of lime and sulphur were being used, and before the formula for the home-made solution was perfected, the wash was being manufactured on a commercial scale and placed on the market. Even as it took a number of years to perfect the home-made wash, it has also taken some time to perfect the commercial lime-sulphur. However, this has been done, and today the lime-sulphur wash, put on in a concentrated form by the best manufacturers, is a standardized solution and much more regular in its composition than any home-made lime-sulphur washes.

The commercial wash, however, is not in as general use as it should be, and the main reason is that most farmers and orchardists think that it is too expensive, when used strong enough successfully to combat the scale. During the past winter a large series of tests was conducted by the Department of Entomology of this Station in order to establish a comparison between the home-made and commercial washes.

Three different brands of commercial lime-sulphur were used, and in order to test the various strengths, three different dilutions were made.

THE GEM DANCE FOLIO FOR 1913

Publishers Price 75c.. Our Price Postpaid 45c.

Arranged from the Season's Most Popular Successes

CONTENTS

Waltz—Good-Bye Rose.
Medley, Barn Dance—The Gaby Glide, Let Me Be the First One Dearie.
Medley, Two-Step—Pollywogg Wiggle, My Sumurun Girl
Medley, Two-Step—That Babboon Baby Dance, Pollywogg Wiggle.
Medley, Two-Step—My Sumurun Girl, Way Down on Sunny Tampa Bay.
Medley, Waltz—A Little Bit of Irish, You May be Irish, Murphy, But I Think That You're in Dutch.
Medley, Two-Step—Make Me Love You Like I Never Loved Before: I've Got a Ragtime Bee in My Bonnet.
Medley, Waltz—Come Back, Marguerite: Tell Me Again You Love Me.
Medley, Two-Step—Big Blonde Baby; Loving Chimes.
Medley, Waltz—The Garden of Allah; I've Got a Girl From My Home Town.
Medley, Schottische—Roo-Ti-Toot (On Your Ragtime Flute);The Turkey Gobbler's Ball.
Medley, Waltz—Roll Me Around Like a Hoop, My Dear; Carmia.
Medley, Schottische—How Do you Do, Miss Ragtime, Sally.
Medley, Barn Dance—Billy's Melody: Dat Lovin' Touch.
Medley, Waltz—Somehow, Sometime, Someplace; There a Little Girl That's Lonesome. (In My Old Kentucky Home).
Medley, Two-Step—I'll Never Have Another Pal Like Mary Mine; Sarah's Hat.
Medley, Gavotte—(Ragtime Nick) Every Moment You're Lonesome, I'm Lonesome Too;
Medley, Waltz—If All the Girls In All This World Were Just as Nice as You; Come Love and Play Peek-a-boo.
Medley, Waltz—When a Girl Whose Heart is Breaking Loves a Boy Who Does Not Care: Just For You Sweeheart.
Medley, Polka—Oriental Rose: My Heart Keeps Right on Beating.

Two-step—My Toledo Man.
Waltz—The Girl I'll Call My Sweetheart, Must Look Like You. From Chauncy Olcott's "Macushla."
Lanciers—The Campus.

THE DELMAR MUSIC CO LIMITED
231 St. Catherine St. West, MONTREAL

As the brands were practically equal in killing power, the average result is given in the table below. The average cost of washes is also used:

Kind of Wash	Time of Preparation	Cost of Preparation	Amount Material Used	Cost Material in Orchard	Total Cost	Per Cent Scale Killed
Commercial 1—11	1 man 5 minutes	1 cent	4 gallons	$0.80	$0.81	89.1
Commercial 1—9	1 man 5 minutes	1 cent	5 gallons	1.00	1.01	94.6
Commercial 1—7	1 man 5 minutes	1 cent	6 1-4 gals	1.25	1.26	94.8
Home-made 15—15—50	2 men 1 hour 15 minutes	36 cents	15 lbs. lime 15 lbs. sulfur	.15 .45 .60	.96	95.1

Two batches of home-made lime-sulphur were tried and the average cost and killing power of the two are used in the table of comparisons. Actual labor cost is charged to each but no fuel is charged to the making of the home-made lime-sulphur. The basis of comparison is made on one barrel—50 gallons—of diluted solution ready to apply.

The above figures on the cost of commercial washes are based on the market price at the time the spray was applied and estimated in half-barrel lots. Of course, when buying in large quantities for use on a large scale in commercial orchards, the price per gallon is not nearly so great. The cost of sulphur is based upon 200-barrel lots, and of lime, the retail price per 100 pounds. The orchard used was fairly heavily infested with scale.

A careful examination of the table given, reveals a number ol interesting facts. First, commercial lime sulphur used at the rate of one gallon of wash to 11 gallons of water did not give a satisfactory control of the scale. Second, the commercial lime-sulphur wash used at the rate of one gallon of wash to seven gallons of water does not justify its application on account of its greatly increased cost, with only a slight increase in killing power. Third, commercial lime-sulphur used at the rate of one gallon of the wash to nine gallons of water kills practically the same percentage of scale, cost five cents more per barrel and took only one-fifteenth as much time to prepare as did the home-made lime-sulphur.

The question naturally arises, especially if the orchard is of any size, "Would it not pay to use the commercial wash, rather than to use half the time in making up solutions?"

The most important phase of the subject, however, has not yet been touched upon. It is as follows: While it makes no material difference whether flour or flowers of sulphur is used, except in cost, the grade of lime has a great deal to do with the effectiveness of your wash. The grade of lime commonly found on the market usually contains from 10 to 30 per cent of impurities. Then, too, few men who own orchards know how to make a good wash, and even if they did, the variation in quality of lime, time of cooking, etc., will give no two solutions of the same density.

At best, the home-made wash, made in the open air, is a variable solution, while all the leading brands of commercial lime-sulphur on the market are manufactured according to a standard.

Taking all the above facts into consideration; cost, variability in strength of home-made washes, standardization of commercial brands and amount of time consumed in preparation of a barrel of spray, it would seem that it would pay the home orchaedist to use the commercial brand at a one-to-nine solution. As to whether it will be the most economical for large orchards, it depends upon the following: labor conditions, distance from stock of commercial wash and mechanical facilities for making the wash at home.

Whatever you do, however, if your orchard is infested with San Jose scale, use one or the other of the mixtures. If the infestation is light or medium, make the application as late in winter as possible and just before the buds begin to swell. If the infestation is heavy, two applications might be necessary. Should this be the case, made one application in the near future, and the second just before the buds begin to swell in the spring.—J. A. Dew, Alabama Experiment Station.

Care for Shade Trees.

This is a season when the shade trees should be carefully inspected. All dead and decaying branches should be removed before the rot fungus finds its way into the heart of the tree. Care should be taven to cut the branches off close up to the body of the tree as stubs left often cause disease and insects to enter the main body of the tree and eventually kill it.

If the land is rather thin it would be a good plan to spread manure around the trees. This gives them a good start when spring opens. Trees that are badly infested with borers or other insects and disease may be greatly benefited by manure. The manure may cause the tree to get a start on insects and diseases so that the pests will not injure it further.

A coat of whitewash often gives some protection against diseases and insects. It always gives the place a cheerful, clean appearance that is desirable. The whitewash may be applied with a brush and the trunks may be covered up as high as one can reach.

Be liberal in your use of shrubs, flowers and ornamental plants. Landscape gardeniag is a very necessary work in making the farm home attractive. Money invested in ornamental plants brings returns in pleasure.

More profit per acre

HOW ?

Manufacturers have found that their costs per unit of production whether it be a pair of shoes, a machine or a yard of cloth, are reduced by increasing the output of the factory. The same principle applies on the farm. Increasing the yield per acre reduces the cost per bushel, thus making more profit. Increased production chiefly depends on increased available fertility which is obtained by the use of high grade fertilizers.

BOWKER'S

Bowker's Fertilizers are high grade and available. They are active, sure, and well backed by forty years of experience, the best of materials and facilities and prompt service. A suitable fertilizer for every crop and adapted to every pocketbook.

We want Agents in unoccupied territory. Write today for prices and terms; this may mean a good business for you if you act at once.

Write anyway for our illustrated catalogue and calendar before you buy your spring fertilizer. We want you to know what we can do.

BOWKER FERTILIZER COMPANY

76 **Lyman Street, Buffalo, N. Y.** 42 **Chatham Street, Boston, Mass.**

Original and largest manufacturers of special fertilizers.

Why Don't You Plant

EWING'S Reliable Seeds

What's the use of giving your land, your time and your work for a season for anything less than the best crops? Ewing's Reliable Seeds have proved, for more than forty seasons, favorable and unfavorable, that they will produce the highest crops of the best quality. Ask your neighbors who plant Ewing's Seeds all about them. Plant them yourself this spring and get the full reward for your work. Your dealer should have Ewing's Reliable Seeds, but if he hasn't, write for our illustrated catalogue and order from us direct.

Wm. Ewing & Co., Seedsmen

DAIRYING.

Curdy Butter and How Remedied.

As a great deal of the farmhouse butter on the market is spoiled by the presence of casein, or caseous matter, it is thought that the chief circumstances which determine the the amount of casein left in butter may be of some interest to many butter-makers.

Milk consists of several different constituentsi namely:—Water, butterfat, casein, milk sugar, and ash, or mineral matter. The chief constituent of milk required for the production of butter is the butterfat. This substance exists in milk in the farm of small globules, which vary in size according to the breed of the cow, and the lactation period.

Owing to the fat globules having a lower specific gravity than the milk serum, they rise to the surface naturally, or may be separated from the milk serum in a very short space of time by means of a centrifugal cream separator; but by whichever means the separation takes place, cream is obtained, and not pure butterfat. Cream consists of the same constituents as milk, but they exist in different proportions, the fat, of course, being the highest, and varying from about 25 to 50 per cent. Where cream is produced expressly for butter-making, it seldom contains more than 15 per cent. of butterfat.

Another constituent of cream is the casein, which, like the fat, is in suspension, but is of a vicious nature, and adheres to the fat globules. When fresh or sweet cream is churned, it results in a lot of casein being present in the finished butter. The churning of sweet cream is the cause of a great deal of butter on the market being poor in quality. Casein is of such a nature that its viscosity is destroyed by lactic acid, which is naturally produced in milk and cream by bacteria. In order to ensure a minimum amount of caseous matter in butter, the cream must be ripened or soured to the extent that it contains from 5 to 6 per cent. of lactic acid. Cream sours quickly in summer, but it is advisable to assist the ripening in winter by the addition of some starter to the cream. It is best to test the cream for acidity by the use of the ordinary acidimeter, as unsuccessful results often obtain when the ripeness of cream is estimated by taste and smell only. When once the fat globules are freed from the casein, they may be collected together in the churn.

It is necessary to churn cream at the right temperature, as having the cream too warm makes it practically impossible to churn to a nice grain, and also causes the butter to contain an excess of caseous matter. The larger the butter grains, and the softer the butter when in the charn, the more casein will there be in the butter when it is made up for market. During the process of churning, as the butter breaks, that is, when it is in a fine, mealy condition, some breakwater is added, which serves to prevent the butter going to a lump, and also washes away the caseous matter adhering to the grains. If at this stage of churning the caseous matter is not removed from the butter grains, it gets pent up in them, and any subsequent washings will not extract it.

The next factor influencing the amount of casein in butter is the washing. It is essential to wash the butter grains thoroughly, in order to remove the caseous matter from them. After drawing off the buttermilk, the butter should be washed with two or three lots of water, until the last lot of water is free from buttermilk on leaving the churn. The more butter is washed the less caseous matter will it contain, but, of course, that actually confined in the butter grains will not be affected by the washings. The use of brine instead of dry-salting butter tends to facilitate the removal of casein from the butter, but the practice of brining butter is only resorted to where small quantities of butter are made at a time. A sample of good butter would not contain more than 5 per cent. of caseous matter, and this would be necessary to give the finished article a prime flavor, while an excess of casein gives butter a bad flavor, as well as short-keeping properties.

When to Feed the Cows.

The question of when to feed the cows, whether before, during or after the milking, is one which has been discussed a great deal by farmers and farm journals. The custom of allowing the cows to eat while they are being milked is quite common, but it never seemed to me to be a wise one, especially if it is the grain feed that is given the cows at that time, and that is undoubtedly what is understood in what is said on this subject.

An investigation which was recently made by the Connecticut Agricultural College seems to show that the conclusion of many dairymen is wrong in thinking that cows will stand more quietly and give their milk down better if they are eating while being milved.

The conclusion of the College investigation is that the man who has once adopted the plan of milking before any feeding is done, seldom, if ever, cares to go back to the old method of having the cows eating whi,e being milked.

The average cow seems to be unable to divide her attention satisfactorily between two operations, and the result is that either she pays most of her attention to eating or else she pays more attention to the man who is milking her, and is, therefore, unable to eat quietly during the milking process, and probably will not see the milker when he approaches,, and the first intimation she has of his presence is when he speaks or touches her, and if she is a nervous cow she will probably either jump or kick, and then continue to annoy him with her tail during the entire process of milking.

If the feeding is being done at the same time as the milking, the annoyance is even greater, since the cow is uneasy until she gets her feed and does not stand quietly or give down her milk freely.

Cows which have been accustomed to eating during the milking process may bother for a few days if the feeding is postponed until after the milking, but they become accustomed to the new order of things very quickly and after a few days will be have much more satisfactorily than they did when the two operations were done at the same time.

It is not only more pleasant to do milking before the feeding is done as a result of the better behavior of the cows, but the sanitary and keeping qualities of the milk are also better than when feeding has been done before or during the milking period.

All of the dry feeds, such as the common grains, hays, etc., contain large quantities of dust, which is thrown into the air by the handling. This dust is heavily charged with bacteria and the atmosphere of the stable thus becomes filled with these micro-organisms.

As this dust settles into the milk pail, it carries down with it the adhering bacteria and the germ contents of the milk is thereby increased

At the same time the restlessness of the cow results in the dislodgement of a greater amount of dust and bacteria from the cow and the milker, and these also fall into the milk.

OUR VALUES

are summed up briefly under the following captions:

Discoulored Milk.

Very annoying to the dairyman and cowkeeper are those departures from the normal in quality and appearance in the secretion of the udder known as bloody milk, red milk, blue milk, and other degrees of discolouration, because the customer has a prejudice against milk that is anything but of a rich creamy yellow. Bloody milk and red milk are very commonly confounded together in spite of the fact that they are entirely different troubles. In the one case blood as blood is present, while in the other it amounts only to a discolouration, and often consists of a red sediment apparent only after the milk has been set up in the pans for creaming, or has stood for some time in the customer's jug. A variety of very different causes are alleged to cause cows to yield bloody milk. The occurrence of oestrum is a reputed cause, so is the continued milking of cows which ought to be dried off. The feeding is considered by many to be at fault, and acid plants such as ranunculus, colchicum, heaths, bracken, and astringent and resinous shoots are mentioned. A sudden accession of rich food is alleged to be a cause, and is supposed to result in the yielding of bloody milk by casual local congestion of the udder, along with an increased secretion. Blows on the udder or commencing inflammation is also mentioned, but the thin red serous fluid yielded in inflammation of the gland structure is something quite distinct from the occurrence of pure blood from one or two quarters, most commonly the front pair, about which so many complaints are made. In the majority of cases of this kind the trouble is due to weakness of capillary blood vessels whieh ramify through the udder, and the blood comes in the strippings. They are often most troublesome to cure, and sometimes the only way out is to dry off the cow. When she is stale it is generally the best course to adopt, but when the cow is in full milk, treatment becomes a necessity. The udder should be bathed with cold water and afterwards anointed with camphorated oil, or a mixture of soap liniment and spirit of camphor in equal parts. Acrid plants should, of course, be as far as possible avoided, but we should expect these to cause digestive derangement, dysentery, liver disorder, or red water, rather than bloody milk.

Notwithstanding the fact that the blood comes with the strippings, complete emptying of the gland must be persisted in, or a worse trouble in the shape of garget, of which imperfect removal of the milk is a fertile cause will be the result. Milk carefully and gently, and as the stained product comes last, it may be drawn into a separate vessel. It cannot be sold for human consumption, but pigs or calves will not refuse it, nor do badly on it, because slightly discoloured. Blue milk and red milk are said to be due to cryptogams or micro-organisms which have been isolated and named, but feeding may have some influence, for it has been demonstrated that the administration of madder, logwood, and similar agents will cause a red sediment in milk. Watery milk with a blue tinge—the "sky blue" of commerce—may be a symptom of advanced tuberculosis.—Dairymaid.

If your children are subject to attacks of croup, watch for the first symptom, hoarseness. Give Chamberlain's Cough Remedy as soon as the child becomes hoarse and the attack may be warded off. For sale by all dealers.

GETTING THE PROFIT ONLY SHARPLES
Tubular Cream Separators Can Pay

John B. Cosing, whose prosperous farm home at Snelgrove, Ont., is shown above, recently discarded his disk-filled cream separator and bought the simple Sharples Dairy Tubular. He prefers a separator with double skimming force and without inside contrivances.

The great Canadian Pacific Railway Demonstration Farm, covering thousands of acres at Strathmore, Alberta, has discarded the complicated cream separator formerly used, and put in the remarkably simple, marvelously durable Sharples Dairy Tubular.

The Holy Angels Convent, at Athabasca Landing, Alberta, recently purchased a Sharples Dairy Tubular, in Edmonton. The Convent is one hundred miles from a railroad and the Tubular was carried to the Convent on a pack-horse. The Tubular was chosen by the Convent because it is the only separator so simple, durable and perfect that it can be relied upon in places where repairs are hard to get.

Those Using Tubulars get an extra profit no other separator can make. No wonder Tubulars are replacing others everywhere. Write directly to us, being sure to ask for Catalog 194 You will receive prompt and courteous attention.

Maritime Farmer Parchment Offer.

The recent offer of the Maritime Farmer to supply its subscribers with guaranteed pure butter parchment at wholesale prices, has resulted in the receipt by the Farmer of many inquiries and already a number of orders have come in. One reader of the Farmer promptly sent in an order for five reams of parchment and saved $2.00 on the order for himself and his neighbors. Other orders have been coming in for printed parchment and for mixed lots printed and plain. In every case the Farmer's patrons have expressed their appreciation of the plan to sell direct to the customer. The Farmer recognizes the assistance it receives from the dairymen of the Maritime Provinces and is glad of the opportunity of reciprocating. A card to the Maritime Farmer will bring full particulars of the co-operative, parchment buying plan. It means a big saving to users of butter parchment, every sheet of which, when supplied by us, has our guarantee as to quality behind it. We buy direct from the largest parchment mills in Germany and thus save the middleman's profit.

Churning in Winter.

In the winter season, difficulty is sometimes experienced in churning the cream. The addition of water at a temperature of 70 degrees F. to the cream, while it is still sweet, to the extent of twenty-five per cent of its bulk, will cause it to yield its butter in less time and more completely. The water should be added before the cream is sour, and at least twenty hours before the churning is commenced. The next treatment is to develop ment of lactic acid, or ripening of the cream. If a quantity of sweet cream is churned, and an equal quantity of ripened cream, of the same quality as to composition, be also churned, there will be obtained, on the average, from the sweet cream only 77 pounds of butter out of every possible 100 pounds; while there may be obtained from the ripened cream 97 pounds out of every possible 180 pounds.

There are thoudands of pounds of butter lost in the country every year from the churning of two qualities of cream in the same churn at one churning. The only safe plan is to have all the cream for each churning thoroughly mixed from twelve to twenty hours before the operation begins. It should be kept at a temperature of from 60 degrees to 70 degrees, according to the season of the year, to permit it to ripen. The higher temperature is required during the winter season, and for separator cream during the summer season also.

Churning is performed for the purpose of causing the globules of fat to strike each other, and unite by impaction. If two globules strike each other at a suitable temperature, they will stick together; when large numbers of them unite in this way, it is said that the butter has come and the particles may be removed and washed.

The size of the fat globules has ability of the cream. Creams vary in their behavior during churning, and not only do creams of different breeds of cows, but frequently cows of the same breeds show variation.

Speaking generally, the larger the fat globules in the cream, the more easily is the butter obtained.

Recent investigations have been made to ascertain the optimism temperature for churning, and to determine the loss in churning at various temperatures. The optimism temperature is found to be 52 degrees F. for all creams; that is to say, the lower the temperature, the less fat is left in the buttermilk. With sweet cream, as much as 30 percent of the total fat may be lost in the butter milk if too high a temperature is used. With ripened cream as much as 20 percent may be lost.—C. G. Freer in Maine Farmer.

FREE-FARM ACCOUNT BOOK

Know How Much You Make This Year

No one shall pay a cent for ***Bickmore's Farm Account Book.*** It will be sent free to any farmer who will be good enough to tell who and where he is. The cost of a crop never demanded closer attention. Business farming puts money in the bank. This book is arranged to keep all accounts in simple form—more simple, and certainly more practical, than trying to remember them; shows what to charge against crop production; has a laborer's time record and section for personal accounts. ***64 pages; for ink or pencil.*** Not a cheap affair. It is meant for business. Its quality is in keeping with

BE SURE AND WORK THE HORSE

BICKMORE'S GALL CURE

a remedy that ***cures,*** and the horse works all the time. Users keep it in their stables the year round—they believe in it. It is always ready for Harness or Saddle Galls, Chafe, Rope Burns, Cuts, Scratches, Grease Heel, etc. In cows use it for Sore Teats. Don't buy a substitute. For the sake of your horse's health, be sure to ask for ***Bickmore's*** Gall Cure at the store. But write now for Bickmore's Farm Account Book—it is ready for ***you.*** No cost. No obligation. Expensive Warming of Barnyard.

Don't you know that it won't pay to warm a barnyard with cows running in it? Do you know that Prof. Plunk made an experiment in Ohio which showed that cows out in the barnyard from 8 A. M. to 4 P. M. ate more food, gave less milk, and lost flesh, while those in the stable gained milk; that the saving in food gain in flesh, ate less food and gave more in flesh and more milk made a difference of over eight cents per day for each cow?

Mighty expensive warming a barnyard with cows at eight cents a day each. Better fix up the stable good and warm, and keep those cows in and get that eight cents extra.—J. L. Woodward.

The co-opetative creamery, when properly managed and supported by farmers, business men and dairymen, it worth a great deal to any community. All business is benefited because it makes farmers more prosperous.

When you want a reliable medicine for a cough or cold take Chamberlain's Cough Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all dealers.

Waterloo Boy Cream Separators Are Good Separators

and you need one if you have the milk of even a single cow. You are wasting quantity and quality of product every day you go without one.

This waste is greatest in cold weather and it counts most of course when butter is high. Then with a separator there is always the warm, sweet skim milk and saving of time and labor in addition.

When it comes to a choice of separator Waterloo Boy superiority is now universally recognized. Those who "know" replace the other separator with a Waterloo Boy later, thousands of users are doing that this year. If you already have some other machine the sooner you exchange it for a Waterloo Boy the better. See and try a Waterloo now while you have plenty of time.

LIVE STOCK.

Why the Boar Should be Kept to Himself.

Is that boar pig recently purchased, or to be purchased this winter, going to run with the herd or is he to be kept by himself?

Many farmers are quite positive that it costs too much to keep a boar in a lot by himself and that it is too much trouble to watch the sows and breed them once and then remove them to separate and quiet quarters apart from the balance of the herd. It is true that among these are most of those who do not find hog raising profitable, but, on the other hand, many who are fairly successful pork producers allow the boar to run with the rest of the herd. Most of our failures in live-stock production are due to the fact that we think it expensive and too much trouble to study the business, and take care of and feed the animals as they must be, to give profitable returns. On the other hand, a man may keep the boar by himself and take good care of him in a wise and economical way and still fail, but failure is more likely to occur when the boar is allowed to run with the herd.

Some of the advantages of keeping the boar in a lot by himself are as follows:

1. If he is young, he makes better growth and development, and if he is mature, he is apt to keep in better condition.

2. He is likely to learn bad habits and is always where wanted.

3. The date of breeding the sows is known, and consequently a larger per cent are got in pig when desired and the date of farrowing is known and more pigs are saved.

The reasons for allowing the boar to run with the sows are that it is too expensive and too much trouble to keep him in a lot by himself and feed him twice a day, and watch the sows and breed them as they come in season. It is more trouble to feed him by himself and turn him to the sows as required; but, results considered, there is serious doubt if it is more expensive to keep the boar by himself. In fact; the writer is of the opinion that the most expensive method of keeping a boar is to allow him to run with the sows, or with the general herd. But many in the South will disagree with me. Perhaos one reason for this is, that we are not accustomed to giving anything such regular care as that method of keeping a boar requires.

If a lot large enough to furnish green feed for the boar is provided, grain need not be fed mare than once a day, and the trouble of feeding and care will not be large. This is the method whish seems best; but if it is not allowed, what is the next best method?

From the time the boar is five months until he is a year old, it is more important that he be kept separate from the other hogs than at any other period. If he is to be allowed to run with the herd, it should not be until he has been grown to an extent sufficient to insure a fair development. If the boar must run with the herd, let it be after he has been well developed. Then he may be allowed to run with the sows or other hogs six months old or more, with least injury to himself.

If, however, the young boar is to be put in a dry lot, and not given proper feed and care, his development may suffer even more than if allowed to run with the herd, provided the latter are given good grazing or are fed properly.

How is he to be fed? When grazing is possible in winter, he should have green oats, wheat or barley and rape. In summer, some of the legumes, Bermuda or other green crops must be furnished for grazing. When dry feed is used, it must be such as soy beans, peanuts and corn grown on the farm. Only the breeder of pure-bred animals to be sold at fancy prices as breeding stock, can afford to purchase feed for hogs, and even then such a practice reduces the profits. But remember that we do not object to feeding the hogs corn, shorts, rice polish, tankage, and similar purchased feeds because they are not good, but it is simply that they are too expensive. It must not be inferred from this that there is to be any stinting of the hog in his feed. He must have plenty of feed or there is no possible chance of success, and while the minimum of grain is to be fed, this can only be profitable when cheaper grazing crops are supplied.

Wintering Breeding Swine.

No question connected with the management of swine has a more direct bearing on profits than the care and management of breeding animals during the cold months. Breeding sows should be given the same care as any other breeding animals. I have always found that it paid to give brood sows as good care as I give dairy cows. The brood sow should have a dry nest and a sleeping place that is warm and free from drafts and dampness. Whenever the weather is favorable she should be turned out to exercise, for no breeding animal can bring good, healthy, vigorous progeny unless she has an abundance of exercise and pure air,

GIVE THE BOAR A GOOD RUN.

The breeding boar should have a house and yard by himself away from the rest of the herd. He should be given plenty of wholesome, nourishing food to enable him to maintain a good, vigorous condition and not take on too much fat. Home-grown grain feeds supplemented with wheat middlings and a little oil meal, make an excellent ration. Whenever possible cut clover or alfalfa should be added to supply bulk and succulence. If these are not at hand, roots should be fed at least two or three times a week. Once a day would be better.

The breeding sow should be given warm feed during the winter. Her food should be nitrogenous in character, since too much concentrated heat-producing foods are sure to cause trouble, and it will be fortunate indeed if she raises any of her pigs.

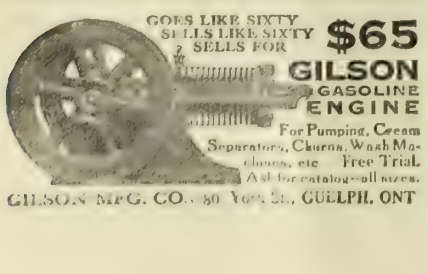
I have found nothing better than cut clover or alfalfa hay cut fine, steamed or soaked in hot water and mixed with wheat middlings, ground oats and corn meal. I feed this mixture in the form of a thick slop twice a day. The cut clover and alfalfa will supply both bulk and succulence and keep the bowels in the good condition.

FLESHY SOWS RAISE THE BEST PIGS

Sows should be in the best possible condition at breeding time and carry an abundance of flesh. The sow that is bred. When she is very thin may bring a good strong litter of pigs, but unless she has a reserve force of stored-up flesh and energy, her pigs will receive poor nourishment and will not make as good gains as the ones from the sows that carried an abundance of flesh at farrowing time.

The flesh carried by the farrowing sow should be the result of a ration of wholesome food, bone and muscle building foods, not put on by corn and other fat-producing foods. Flesh is not fat and the sow that carries considerable flesh as the result of rational feeding will have larger and more thrifty pigs at weaning time than the sow that farrows while extremely thin and consequently not in condition to properly nourish her young.

By wintering and feeding our breeding swine under the right conditions we can avoid trouble in handling the early spring litters. When we lose these we lose the profits for the season, for we cannot replace them.—Farm and Home.



GILSON MFG. CO., 80 York St., GUELPH, ONT

SEED OATS!

If the farmers of the Maritime Provinces, Quebec and Ontario want to make sure of getting the highest possible grade of seed oats for the Spring of 1913 apply to us at once. To prevent a repetition of the disaster that befell so many farmers last year by sowing devitalized grain, we have stored at Point Du Chene and Pictou 50,000 bushels of **large, selected, separated White Seed Oats, true to name and free from noxious weed seeds.** It will be the farmers own fault if they do not procure good seed as the extra yield of these oats pays twice over cost of the seed.

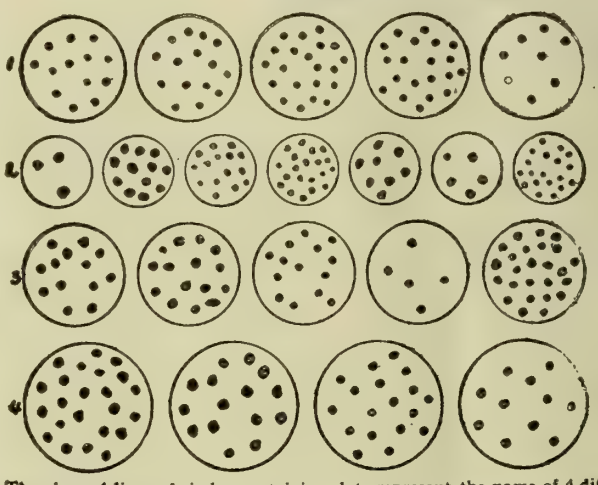
Our firm name is stencilled on every bag. Do not allow the dealers to give you other than Read's oats for seed.

JOSEPH READ & CO., LTD., Summerside, P. E. I.

FREE $300.00 IN PRIZES

IN THE GREAT DOT PUZZLE CONTEST
A Genuine Contest for WISE HEADS!

SOLVE THIS PUZZLE



The above 4 lines of circles containing dots represent the name of 4 different things described after each line. What are they?

HOW TO SOLVE THIS GREAT PUZZLE

Each circle of dots represents 1 letter of the word and the number of dots in each circle determine the letter in its relation to the alphabet. For instance: A is represented by 1 dot because it is the first letter in the alphabet, B is represented by 2 dots because it is the 2nd letter in the alphabet, C is represented by 3 dots because it is the 3rd letter in the alphabet. Now, with these simple instructions and a little patience you can soon have the puzzle solved. To give you a little assistance the 1st letter of the first word is M, because the circle contains 13 dots and M is the 13th letter of the alphabet.

After you have found the solution write your answer neatly on a piece of paper with your name and address and anything else you wish to say about the contest and send it in to us.

Those who send in the Correct or the Nearest Correct Answers; whose answers are the neatest and who live up to the condition of the contest (read rules of contest below), will win the following grand prizes:—

1st	Prize,	$125 00	in cash.
2nd	"	50.00	"
3rd	"	25.00	"
4th	"	15.00	"
5th	"	Gent's Watch.	Value $10.00.
6th	"	Ladies' Ring.	Value $10.00.
7th	"	Fine Clock.	Value $10.00.
8th	"	44-Piece Dinner Set.	Value $10.00.

9th Prize, Mission Upholstered Rocker Value $10.00.
10th Prize, Violin. Value $10.00.
11th Prize, Gillette Safety Razor. Value $5.00.
12th Prize, Waterman Fountain Pen Value $5.00.
13th Prize, Glass Water Set. Value $5.00.
14th Prize, Large French Doll. Value $5 00.
15th Prize, Silverware Set. Value $5.00.

READ THE SIMPLE RULES OF THIS CONTEST

1. Contestants may send in as many answers as they wish, but only one answer can win a prize. (2) Only 1 person in each family will be allowed to compete. (3) No employees of ours or any relation of any employee will be allowed to compete. (4) Children under 12 years of age will not be permitted to compete. (5) Write only on one side of the paper. (6) All letters must be fully prepaid in postage. We will not accept answers upon which we will have to pay postage. (7) The decision of the judges must be accepted as final. The judging will be in the hands of 3 gentlemen of integrity who are absolutely disinterested. (8) This contest is absolutely free. You are not asked to spend one cent of your money or buy anything to enter. As soon as we receive your answer we will immediately tell you if you are right, and how the prizes will be distributed. We guarantee the awarding of the prizes described above according to decision of the judges.

Address all answers to **Contest Department. 220**

NEW LIFE REMEDY COMPANY, TORONTO, ONT.

Keep up the Grain Feed for Lambs and Breeding Ewes.

Do not slacken the grain feed on the lambs or the breeding ewes because the weather is mild and they seem to be gathering a fill from the pastures. Pastures at this season of the year are not generally as good as they appear to be, since the frost and freezing has greatly reduced their feed value, especially pastures that have been kept well eaten down through the summer and early fall. Sheep, however, are persistent grazers, and if given their liberty will go out on the fields when not stormy or covered with snow and gather the dried, frosted grass, even when it is of little or no feed value.

The sheep will come in toward the close of the day, often looking plump and full, when the grass they have gathered is not sufficient to keep them thriving. This is where some inexperienced sheep handlers deceive themselves by the full appearance of the sheep and cut down the grain feed as a matter of economy, thinking the mild weather and the dead pasture sufficient to carry them along. A little grain—shelled corn is really preferable to other feeds—will keep sheep under these conditions moving right along, though to get the best results a little bright, well cured hay should be placed in the racks each evening for the sheep to feed on during the open fall and winter weather.

It never pays to change the grain feed on sheep because of mild weather in the winter. Keep right on with the grain allowance, but slacken up on the hay, then shorten down in the allowance until they clean it all up, or approximately. There is sometimes a little refuse in the hay—old stubble, weeds or coarse stubs of hay—that the sheep have refused. Take all this refuse out and use it for bedding. Never try to force sheep to eat refuse, coarse, unpalatable stuff that they have culled out in eating.

There is one great need in the care of sheep, and that is to keep their feed clean. The providing of feed troughs and hayracks that they cannot get into with their feet is a necessity, as they will very soon soil these feeds and troughs so that the other sheep will not taste them. This This is an easy matter to regulate and should be observed. Sheep are often fed corn shelled or in the ear, and fed out on the ground, and this is generally successful if it is scattered on sod and scattered so it does not get soiled by the sheep ant they walk over it. The flat-bottomed trough is the best style of trough to feed grain in. This should be set up six or eight inches from the ground set ten inches above the trough, running parallel with the trough and dividing it in the center as nearly as can be. This keeps the sheep from jumping over the trough or from getting their feet in it. A trough so fastened should be held solid at each end by a headpiece, board or stake driven in the ground and nailed to the end of the trough. These upright end pieces should have a slot sawed in the upper end for the trough division board to crop into. Where there is nothing to stop the sheep from jumping over the trough there will always be some sheep that will be in the trough.

The sheep feed yard should not be used by other stock and should be kept as dry and free from mud as possible. To have a grain feed lot is a great convenience, as the grain feed can be distributed in the troughs before the sheep are let into the yard thus a more even chance for the sheep to get the feed properly apportioned among them.

How the Champion Load of Short-Feds at the Last International Were Made.

Details of the manner in which M. H. Feddersen of Bryant, Ia., prepared the champion load of short-fed cattle at the 1912 International, together with the financial results of the operation, will be of interest to commercial feeders:

On February 3, 1912, these cattle weighing 950 lbs. each, were purchased at $5.25 per cwt. and as per requirements for entry to the short-fed special contest, were fed no grain prior to Aug. 12. From February 3, up to April 10 the feed consisted of rather coarse timothy hay and the fodder taken from about 2½ acres corn planted very late on land seeded to spring wheat, which was killed out by a rank growth pf weeds. On April 7 the cattle were turned on 60 acres of good blue grass pasture, with a good deal of old grass left from the previous season. Here they remained without any additional roughage until August 12, when they were put on grain feed. The snow storms during April made it necessary to bring the cattle up to feed for a few days.

On August 12, after twelve hours off feed and water, the eighteen steers averaged 1205 lbs, showing a gain of 258 lbs. over purchase weights. During the first 60 days of the feeding period the cattle had access to 40 acres of pasture from which a crop of hay had been taken and the grain consisted of cracked corn, speltz and oil meal. A full feed was reached in about two weeks and practically no steers went "off feed." When the steers showed an inclination to lag a little, molasses feed was added to the ration to whet the appetite. The gradual change from old to new corn commenced September 1.6. During the last thirty days the cattle received 5½ lbs. of oil meal per head per day. Complete figures follow:

	Cost.
18 steers averaging 950 lbs, at $5.25 per cwt	$897.84
2½ acres corn fodder at $10 per acre	50.00
10 tons hay at $10 per ton	100.00
60 acres pasture to Aug. 12, at $4 per acre	240.00
Interest on investment at 6 per cent	73.87
Cost up to Aug. 12	$1,341.71
FEED BILL AUG. 12 TO NOV. 30.	
52 bu speltz at 30c per bu	$15.60
4 tons oil meal at $35.50 per ton	134.00
335 bu cracked corn at 75c per bu	251.63
587 bu new corn at 40c per bu	234.90
1½ tons Champ. Molasses Feed at 26.50	39.75
Pasture Aug. 12 to Oct 10	20.00
1 ton alfalfa hay at $16 per ton	16.00
Corn stover	10.00
Cost to Nov 30	$2,063.59
Swift, 15 steers, 22,860 lbs at $10.70	$2,446.02
Armour, 3 steers, 4,660 ,bs. at $10.75	500.95
	$2,946.97
Commission and charges	131.00
Net proceeds	$2,815.97
Premium	300.00
	$3,115.97
Cost	2,063.59
Net profit	$1,053.38

Breed the Old Sows.

I prefer to breed the old sows and retain them as long as they give satisfaction. As a rule brood sows are sacrificed long before their usefulness as breeders is lost, while untried and oftentimes inferior ones are put in their place. Litters from old sows are more profitable. They are usually larger in number and size and make better growth than pigs from young sows. It is a common thing for pigs from old sows to weigh 50 pounds more than pigs from immature sows at 10 months of age.

If an old sow proves to be a poor breeder of course she is discarded. I never breed my sows until mature. When bred too young the result is usually a stunted sow, susceptible to disease and a small, weak litter of undersized pigs. The old brood sow is more profitable and safer.

Maple Syrup Makers Enter This Contest

$500 IN GOLD CASH PRIZES

WHY not be a WINNER in this contest? We are giving away $500 in Gold Cash Prizes to users of the Grimm "Champion" Evaporator.

Cut Out This Coupon

Full particulars will be mailed on receipt of above coupon.

The competition will take place during the last two weeks of April and the samples of syrup and sugar received will be placed on exhibit in the show windows of the "Montreal Star." Every purchaser and user of the Grimm "Champion" Evaporator may take part in this contest. ***Now is the time to properly equip yourself*** to make high grade syrup and sugar—high priced and therefore profitable. Do it now before the sap runs. State the number of trees you will tap and we will give you prices on a suitably sized outfit. Address all enquiries:

FREE This 150 PIECE Complete Scholar's Outfit FREE

BOYS AND GIRLS, NEVER BEFORE IN CANADA HAS SUCH A GRAND PREMIUM BEEN OFFERED AND SO EASY TO GET.

READ WHAT THIS GRAND SCHOLAR'S OUTFIT CONTAINS.

1 large leather bound school bag, 1 dozen fine quality H. B. pencils, 6 steel tip pen holders, 1 dozen 292 pennibs, 50 sheets of writing paper, 1 dozen envelopes to match, 1 box of 15 water color paints with brushes and pots, 10 beautiful drawing crayons of different colors, 1 fine quality steel blade penknife, 1 large hardwood slide top pencil box, 1 complete printing outfit containing type, ink, tweezers and stamping pad, 1 twelve inch ruler, 1 large memorandum book, 1 compass good for five years, 1 large rubber eraser, 1 steel blade pencil sharpener, and last but not least, 1 Swiss warbler the greatest invention for imitating birds and animals.

Think of it this scholar's complete outfit is **FREE.** We are determined to sell a million packages of Marvel Bluing this year and are sparing no expense to reach this mark.

Marvel Bluing is a great improvement on the old style of bluing and goes twice as far. Everybody buys it because it is so good and a present is given away with every package.

We will give you one of these grand scholar's outfits **IF YOU WILL AGREE TO SELL ONLY 25 PACKAGES OF MARVEL BLUING AT ONLY 10c. PER PACKAGE.** Any boy or girl can sell 25 packages easy. No trouble at all.

We send you the Marvel Bluing free and trust you with it until sold. Simply send us your name and address to-day. Every girl and boy should win one of these grand scholar's outfits. Try. If you can't sell the Marvel Bluing send it back to us.

Address to-day **THE MARVEL BLUING CO., Dept. S.** 101 Toronto, Ont.

EXTRA SPECIAL PRIZE FOR PROMPTNESS

A $2.50 fountain pen has 14k solid gold nib, with Iridium tip, large hard rubber bowl, a guaranteed writer. Every boy and girl has an opportunity to secure one of these fountain pens, just for being prompt in answering this advertisement.

THE HORSE.

Cow Kicking.

A most insidious form of kicking is that known as cow-kicking, in which the horse strikes forward towards its shoulder with a hind foot instead of lashing out rearwards in the ordinary manner. One has to be particularly careful to avoid being hit by a horse that cow-kicks, for one is liable to be struck by the animal when standing near it in a position ordinarily quite safe and out of range of the horse's hind feet. Thus a cow-kicker can easily administer a blow to a person when he is drawing up the girths of the saddle or adjusting the girth-band of the harness, or even when stooping down to lift up a fore-foot. What frequently makes it more dangerous is that the horse fails to give any warning of its intention to cow-kick by laying back its ears and "showing the white," by means of which signs an ordinary kick is uaually heralded. Fortunately cow-kicking is not a frequent habit, and is chiefly confined to mares. Geldings and entires rarely show any such prof pensity, but the last often strike out with a foreleg.—Argus.

Breading-Out or After-Sweating in Horses.

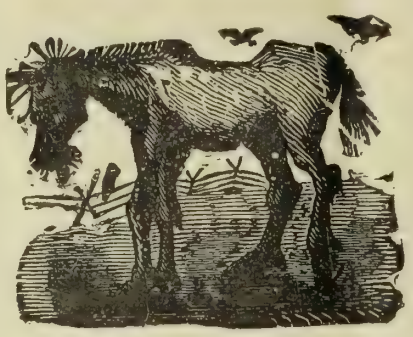
The tendency to break out into a cold sweat after returning to the stable from work is a frequent source of trouble in the stable management of horses, the evil being usually referred to briefly as breaking out. Such after-sweating entails a most weakening effect and otherwise militates against the well-being of the horse, as well as exposes it to the risk of catching a chill, to say nothing of the fact that it renders the animal very uncomfortable for tne time. The need for guarding against this is fully appreciated by all experienced stablemen, and if suitable precautions are adopted, it is quite possible to prevent it in the majority of cases. A typical case of breaking out is as follows: The horse may return to the stable in a very cool state and not sweating in the least. Having been given a quick wisp over with a handful of straw and rugged, it is left dry and apparently perfectly comfortable, but after an hour's time or so, it is seen to be perspiring profusely, the coat being saturated with a clammy sweat, while the rug, too, has become very wet absorbing the perspiration, the moisture often being collected in small beads upon its surface. The horse, further, feels very cold, especially about the ears and the extremities, and possibly it may also have a fit of shivering. Altogether it looks ill at ease. No time should be lost in taking off the wet rug and giving the animal a very vigorous and prolonged rub-down with straw wisps in order to stimulate the surface circulation and at any rate partially to dry the coat. To get the latter completely dry by means of wisping will usually be impossible. Having got the horse fairly warm and comfortable in this way, there should be placed on the animal's back a layer of clean straw, and a dry rug over the straw. That allows a current of air to circulate underneath the rug, which will materially promote the drying of the coat while it will also prevent the moisture from being absorbed by the rug. Finally a drink of water oatmeal gruel will do the horse much good and help to make it more comfortable,while it will also be advantageous to put woolen bandages on the legs for the purpose of warmth.

Have the horse briskly rubbed down on its return to the stable, not in the prefunctory manner so often done, but very thoroughly, and at least a quarter of an hour should be spent over the process. An important precaution to be observed is to place some straw between the horse's back and the rug, as has been described above. This is a most valuable safeguard, which cannot be too strongly recommended. Moreover, apart from helping to obviate after-sweating, the rug will keep much dryer if there is a layer of straw underneath it, should the animal's coat still be wet with sweat or rain, whereas the moisture in it will quickly soak into the rug and so make it very wet if it comes into direct and close contact with the coat. A wet or merely damp rug does not afford much warmth, and alone is very often the cause of a horse breaking out. Even when the expedient of putting some straw under it is adopted the rug will often become more or less damp after a while if the horse is left very wet when it is rugged up. In this case the rug should forthwith be changed into a dry one for which purpose there ought always to be one or two spare rugs available in the stable. One rug per horse is certainly not enough. Rugging up a horse immediately it comes in will frequently induce after-sweating, and that is therefore wrong, although it is often mistakenly held that one cannot get the rug on too quickly. But there need be no hurry about that, even when all rubbing down is omitted. The proper thing to do is to allow the horse to cool down a bit first it being left uncovered for about ten minutes or so, and then only should the rug be put on. There is no danger whatever of the animal catching cold meanwhile, and the risk of its breaking out is minimised in this way. In subjects with a special tendency to after-sweating, it is advisable, in addition to observing the precautions indicated, to keep a careful eye on them for the first hour, and should they commence to break out on any part of the body (usually the sweating first breaks out at the lower part of the flanks, in the thighs, or about the neck), the wet parts should be well rubbed down and dried with wisps of straw. The rug should also be taken off for a couple of minutes, and fresh straw placed underneath it. In this way further and more extensive sweating may in most cases be successfully checked.

Breaking-out is particularly liable to occur during the winter in horses which carry a heavy coat, and the evil in this case proves especially troublesome because once the coat has become saturated with perspiration it takes hours to dry again, while often it remains wet all through the night, and still feels damp the next morning. In such circumstances a horse naturally cannot thrive properly. There is, however, a very simple remedy for this, and that is to have the coat clipped. Where the heavy coat alone is responsible for the after-sweating, clipping will eventually prevent all further trouble in that direction, and a marked improvement in the animal's condition will usually quickly follow. In frequent cases, the trouble is more or less constitutional; that it is apt in particular to affect horses of a delicate or of a so-called washy constitution, and such ought always to be clipped in order to avoid this eveil as far as possible. Horses which are in a weak or soft condition are also specially prone to suffer from after-sweating. Breaking out, in fact, is one of the signs indicating want of fitness in a horse. When due to this cause the trouble will, however, soon cease on the animal attaining greater hardness of condition.—Mark Lane.

Horsemen Attention ! !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevents the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.



Before Using

CURES:

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

DEAR SIR :--I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

Hillsboro, N. S.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

(Signed) G. E. CRONKHITE, (Horseman),
Hawkshaw, N. B.

POULTRY.

Small vs. Large Flocks.

Editor the Maritime Farmer:—

For years the beginner has been advised to start in the business in a small way. In fact, he has been cautioned to do so that he might increase in knowledge as his plant enlarged. It is not necessary to go over all that again, but more important to take up the methods employed by so many beginners—and not a few others who have been in the business for several years.

It is false economy to have these large families, as has been proved time and again. The most successful poultrymen and poulterers of today are of the same opinion.

The arguments used by advocates of large families—fifty or more in a flock—are:

1st. It saves expense in building.

2nd. It saves labor in feeding and watering.

3rd. It saves time.

Grant that there will be less building required, and that time and labor will be saved, the argument in favor of small flocks—not more than twenty five head in a pen—means:

1st. There will be no crowding and fighting on the roost at night.

2nd. These will be more exercise taken when the fowls are compelled to remain indoors.

3rd. There will be less vices like feather-pulling, egg-eating, bleeding the male bird's comb, etc.

4th. There will be more eggs.

5thf There will be better fertility.

6th. There will be better health.

Are not such reasons worth more than the expense of extra lumber, extra labor, extra time?

If there is anything wrong with the hens—such like an ailment, or drooping, or an accident—it will be more readily noticed in a small flock than in a large one.

In small flocks there is a better chance to see that all the fowls get a proper share of the feed. There are fewer "bullies" who drive away the more timid birds.

Overcrowded flocks are not the active, energetic hens that are so needed to make profitable egg production. Besides, there cannot be the proper fertility. On farms where there are these large, common flocks, two or more males are allowed with the hens at the same time. Even if these males do not quarrel they are always interfering with the other's attention to the female. This not only cripples fertility but is injurious to the hens.

But the greatest view point is that from health. It is a noteworthy fact that the bulk of inquiries that come to the editor, asking for roup, cholera, and other ailment remedies, come from farms upon which it is the custom to have large flocks. At night these birds crowd on the roosts, get close together, and the animal heat makes them "sweat." This condition causes an injury when the next morning the hens fly from their roosts and go out to face a temperature many degrees colder than what they had during the night.

For successful work, we repeat, never allow more than twenty-five fowls in one flock, and the nearer you keep the number to fifteen, the better will be the returns.

First grow bone and muscle, and then put on fat.

Corn forms the meat.

Close-grained poultry are most desirable. ...

Pure food poultry are most desirable.

Pure food improves the flavor of the meat.

It takes about eight weeks to grow a squab broiler.

Dark pin feathers give a dirty appearance to a dressed carcass.

Crooked breast bones spoil the looks of an otherwise attractive dressed fowl.

Unless the animal heat is all out of the carcass before packing to ship, there will be a discoloration of the skin.

For the production of broilers and medium-sized roasters, no varieties of fowls excel, if they equal, our American breeds. The bulk of buyers want a fowl that weighs ten to eleven pounds to the pairs or about five apiece.

The Houdan fowl may well be termed the Queen of the French Farmyard. It not only has an elegant carriage and form, and a gay and enticing plumage, but it also has all the practical qualities that one could wish in a fowl. It is a good layer, easy to fatten, and their flesh is of delicate flavor.

The poultry medicine chest should contain: a box of one-grain quinine pills, a bottle of a reliable liniment, a box of a good family liver pill, bottle of glycerine, and a bottle of spirits of turpentine. There should also be a can of kerosene oil within reach.

Nitrogenous foods are the frame makers. Carbonaceous foods do not build up the frame.

In breeding for fat, it is necessary to give more than can be converted into life and energy, and the surplus is deposited in the form of fat in the gizzard, intestines and under the skin. But if this fat feeding is carried beyond needs, the result is a diseased fowl, consequently very few eggs This diseased condition is caused by the hens eating too much carbohydrates to balance the proteins. Like humans, fowls like and require a variety of food stuffs, for the reason that they can assimilate from the various substances the flesh forming, energy-producing, and the mineral matter necessary to maintain the normal equilibrium of the body.

Poultry farmers are plain people. As a rule they are not college-bred. Therefore much of this scientific talk about balanced rations and other matters we find in books written by "highly educated" professors, finds very little "fertile soil" in the minds of these plain, honest, working farmers. Their knowledge of the feed question is that wheat, oats, barley, and occasionally buckwheat, make eggs; they know that of all grains, corn is the best for fattening; they are also acquainted with the fact that bran, middlings, cornmeal, ground oats and meat scrap makes the best composition for a morning mash, and when they find that the bowels of the fowls gre loose they increase the amount of middlings and reverse the order when they find there is a tendency to costiveness. These plain, hardworking people also know that green food is a necessary article in the poultry bill of fare, and that it must be given while the fowls are in confined quarters and not necessarily while they have free range. They were taught the lesson long ago that grit for grinding, and oyster shells for lime for making egg shells are necessary adjuncts to the diet. Now these folks have come into the possession of all this knowledge without being compelled to wade through a lot of scientific lore which would be very apt to confuse them.

It is a mistake to discard a good breeding fowl as long as it keeps in good, breeding condition. On the farm of the writer are some hens that are stil, profitable breeders at four years of age. But as a rule, a hen is of very little use after she has passed her second laying season.

The man who will look for the cause of his failure, will very often have pointed out to him the proper road to success. He who will not investigate the cause is very apt to encounter the same stumbling block again. Experience is a great teacher.

The Lawrence-Williams Co.

TORONTO, ONT. CLEVELAND, OHIO.

Some years ago Henry Van Dresser, before a Western Farmers' Institute told how to get rid of surplus poultry when prices are very low. He said that all should join hands and have a killing day. Put a large pot on the stove, kill and dress the birds, put them into a pot and boil until tender. Have Mason jars ready and fill with chicken, pouring the juice on top, cover with fat or melted butter, and seal while hot. It will keep through the year and then can be prepared in many different ways for the table. It makes a convenient dish for unexpected company.

After repeated trials with the different breeds, the writer has become convinced that where a person wishes to cater almost exclusively to a meat market, as well as a winter egg trade, he will make no mistake in keeping three varieties: Light Brahmas for large-sized roasting fowls; Plymouth Rocks for medium-sized roasting fowls and spring chickens; and White Wyandottes for small-sized roasting fowls and broilers. Should a summer egg trade also be desired, then the Leghorns could be used, principally on account of their non-broody traits. They will be laying when the American and Asiatic classes are thinking of raising families. In cases where the market does not call for large-sized roasting fowls, it is advisable to cut out the Brahmas and keep only the other two mentioned. If the market is not a good one for broilers, then either the Plymouth Rocks or the Wyandottes would fill the bill, and in that case it would be best to keep only one breed. In mentioning these particular breeds it is not done to convey the idea that they are the only ones fitted for that class, but rather to show about what class of fowl is needed. The Rhode Island Reds, or the Orpingtons, for instance, might suit the fancy better. —M. K. Boyer.

Mrs. A. R. Tabor, of Crider, Mo., had been troubled with sick headache for about five years, when she began taking Chamberlain's Tablets. She has taken two bottles of them and they have cured her. Sick headache is caused by a disordered stomach for which these tablets are especially intended. Try them, get well and stay well. Sold by all dealers.

125-Egg Incubator and Brooder Both For **$13.75**

If ordered together we send both machines for only $13.75 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Especially adapted to Canadian climate. Incubator and Brooder shipped complete with thermometers, lamps, egg tester, use when hatching, showing the high grade year guarantee—30 days trial. Incubators finished in natural redwood, showing the high grade fornia Redwood lumber used—not painted to cover inferior wood. If you will compare machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our $13.75 is for both Incubator and Brooder and covers freight and duty charges. Send for free catalog today. Send $2.00 deposit and save time. Write us today. Don't delay.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

They began to close again, and I began to nod as the recollection rises fresh upon me. Once more the little room, with its open corner cupboard, and its square-backed chairs, and its angular little staircase leading to the room above, and its three peacock feathers displayed over the mantlepiece— I remember wondering when I first went in, what that peacock would have thought if he had known what his finery was doomed to come to fades from before me, and I nod and sleep. The flute becomes inaudible, the wheels of the coach are heard instead and I am on my journey. The coach jolts, I wake with a start,and the flute has come back again, and the Master at Salem House is sitting with his legs crossed, playing it dolefully, while the old woman of the house looks on delighted. She fades in her turn, and he fades, and all fades, and there is no flute, no Master, no Salem House, no David Copperfield, no anything but heavy sleep.

I dreamed, I thought, t hat once while he was blowing into this dismal flute, the old woman of the house who had gone nearer and nearer to him in her ecstatic admiration, leaned over the back of his chair and gave him an affectionate squeeze around the neck, which stopped his playing for a moment. I was in the middle state between sleeping and waking, either then or immediately afterwards for, as he resumed—it was a real fact that he had stopped playing—I saw and heard the same old woman ask Mrs. Fibbitson if it wasn't delicious (meaning the flute), to which Mrs. Fibbitson replied, "Ay, ay! yes!" and nodded at the fire; to which, I am persuaded, she gave the credit of the whole performance.

When I seemed to have been dozing a long while the Master of Salem House unscrewed his flute into three pieces, put them up as before, and took me away. We found the coach very near at hand, and got upon the roof; but I was so dead sleepy, that when we stopped on the road to take up somebody else, they put me inside where there were no passengers, and where I slept profoundly, until I found the coach going at a footpace up a steep hill among green leaves. Presently, it stopped, and had come to its destination.

A short walk brought us—I mean the Master and me—to Salem House, which was enclosed with a high brick wall, and looked very dull. Over a door in this wall was a board with Salem House upon it; and through a grating in this door we were surveyed, when we rang the bell, by a surly face, which I found, on the door being opened, belonged to a stout man with a bull-neck, a wooden leg, over-hanging temples, and his hair cut close all round his head.

"The new boy," said the Master.

The man with the wooden leg eyed me all over—it didn't take long, for there was not much of me—and locked the gate behind us, and took out the key. We were going up to the house, among some dark heavy trees, when he called after my conductor.

"Hallo !"

We looked back, and he was standing at the door of a little lodge, where he lived, with a pair of boots in his hand.

"Here! The cobbler's been," he said, "since you've been out, Mr. Mell and he says he can't mend them any more. He says there ain't a bit of the original boot left, and he wonders you expect it."

With these words he threw the boots towards Mr. Mell, who went back a few paces to pick them up, and looked at them (very disconsolately, I was afraid) as we went on together. I observed them, for the first time, that the boots he had on were a good deal the worse for wear, and that his stocking was just breaking out in one place, like a bud.

Salem House was a square brick building with wings, of a bare and unfurnished appearance. All about it was so very quiet, that I said to Mr. Mell I supposed the boys were out; but he seemed surprised at my not knowing that it was holiday-time. That all the boys were at their several homes. That Mr. Creakle, the proprietor, was down by the sea-side with Mrs. and Miss Creakle. And that I was sent in holiday-time as a punishment for my misdoing. All of which he explained to me as we went along.

I gazed upon the school-room into which he took me, as the most forlorn and desolate place I had ever seen. I see it now. A long room, with three long rows of desks and six of forms and bristling all round with pegs for hats and slates. Scraps of old copy-books and exercises litter the dirty floor. Some silkworms houses, made of the same materials, are scattered over the desks. Two miserable little white mice, left behind by their owner, are running up and down in a fusty castle made of pasteboard and wire, looking in all the corners with their red eyes for anything to eat. A bird, in a cage very little bigger than himself, makes a mournful rattle now and then in hopping on his perch, two inches high, or dropping from it; but neither sings nor chirps. There is a strange unwholesome smell upon the room, like mildewed corduroys, sweet apples wanting air, and rotten books. There could not well be more ink splashed about it, if it had been roofless from its first construction, and the skies had rained, snowed, hailed, and blown ink through the varying seasons of the year.

Mr. Mell having left me while he took his irreparable boots up-stairs, I went softly to the upper end of the room, observing all this as I crept along. Suddenly I came upon a pasteboard placard, beautifully written, which was lying on the desk, and bore these words: "Take care of him. He bites."

I got upon the desk immediately, apprehensive of at least a great dog underneath. But, though I looked all round with anxious eyes, I could see nothing of him. I was still engaged in peering about, when Mr. Mell came back, and asked me what I did up there ?

"I beg your pardon, sir," says I, "if you please, I'm looking for the dog."

"Dog?" says he. "What dog !"

"Isn't it a dog, sir?"

"Isn't what a dog ?"

"That's to be taken care of, sir ; that bites ?"

"No, Copperfield," says he, gravely; "that's not a dog. That's a boy My instructions are, Copperfield, to put this placard on your back. I am sorry to make such a beginning with you, but I must do it." ...

With that he took me down, and tied the placard, which was neatly constructed for the purpose, on my shoulders like a knapsack; and where ever I went, afterwards, I had the consolation of carrying it.

What I suffered from that placard nobody can imagine. Whethere it was possible for people to see me or not, I always fancied that somebody was reading it. It was no relief to turn round and find nobody; for wherever my back was, there I imagined somebody to be. That cruel man with the wooden leg, aggravating my sufferings. He was in authority, and if he ever saw me leaning against a tree, or a wall, or the house, he roared out from his lodge door in a stupendous voice, "Hallo, you sir ! You Copperfield! Show that badge conspicuous, or I'll report you!" The playground was a bare gravelled yard open to all the back of the house and the offices; and I knew that the servants read it, and the butcher read it, and the baker read it; that every body, in a word, who came backwards and forwards to the house, of a morning when I was ordered to walk there read that I was to be taken care of for a bit. I recollect that I positively began to have a dread of myself, as a kind of wild boy who did bite.

There was an old door in this playground, on which the boys has a custom of carving their names. It was completely covered with such inscriptions. In my dread of the end of the vacation and their coming back, I could not read a boy's bame, without inquiring in what tone and with what emphasis he would read, "Take care of him. He bites." There was one boy—a certain J. Steerforth—who cut his name very deep and very often, who, I conceived, would read it in a rather strong voice, and afterwards pull my hair. There was another boy, one Tommy Traddles, who I dreaded would make game of it, and pretend to be dreadfully frightened of me. There was a third, George Demple, who I fancied would sing it. I have looked, a little shrinking creature, at that door, until the owners of all the names—there were five-and-forty of them in the school then, Mr. Mell said—seemed to send me to Coventry by general acclamation, and to cry out, each in his own way, "Take care of him. He bites !" ...

It was the same with the places at the desks and forms. It was the same with the groves of deserted bedsteads I peeped at, on my way to, and when I was in, my own bed. I remember dreaming night after night, of being with my mother as she used to be, or of going to a party at Mr. Peggotty's, or of travelling outside the stage-coach, or of dining again with my unfortunate friend, the waiter, and in all these circumstances making people scream and stare, by the unhappy disclosure that I had nothing on but my little nightshirt and that placard.

In the monotony of my life, and in my constant apprehension of the re-opening of the school, it was such an insupportable affliction! I had long tasks every day to do with Mr. Mell; but I did them, there being no Mr. and Miss Murdstone here, and got through them without disgrace. Before and after them, I walked about—supervised, as I have mentioned, by the man with the wooden leg. How vividly I call to mind the damp about the house, the green cracked flagstones in the court, an old leaky water-butt, and the discolored trunks of some of the grim trees, which seemed to have dripped more in the rain than other trees, and to have blown less in the sun! At one we dined, Mr. Mell and I, at the upper end of a long bare dining room, full of deal tables, and smelling of fat. Then, we had more tasks until tea, which Mr. Mell drank out of a blue tea-cup, and I out of a tin pot. All day long, and until seven or eight in the evening, Mr. Mell, at his own detached desk in the schoolroom, worked hard with pen, ink, ruler, books, and writing paper, making out the bills (as I found) for last half-year. When he had put up his things for the night, he took out his flute, and blew at it, until I almost thought he would gradually blow his whole being into the large hole at the top, and ooze away at the keys.

I picture my small self in the dimly lighted rooms, sitting with my head

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

Mrs. H. VON RODEN of LYNDON, KY.

Recommends Lydia E. Pinkham's Vegetable Compound for Backache, Nervousness, Headaches.

Lyndon, Ky.—"I have been taking Lydia E. Pinkham's Vegetable Compound for headaches, neuralgia pains, backache, nervousness and a general run down condition of the system, and am entirely relieved of these troubles. I recommend your remedies to my friends and give you permission to publish what I write." —Mrs. H. Von Roden, Lyndon, Ky.

When a woman like Mrs. Von Roden is generous enough to write such a letter as the above for publication, she should at least be given credit for a sincere desire to help other suffering women, for we assure you there is no other reason why she should court such publicity.

Canadian Woman's Experience:

Windsor, Ont.—"The birth of my first child left me a wreck with terrible weak spells, but I am glad to tell you that I do not have those weak spells and I feel like a new woman since taking Lydia E. Pinkham's Vegetable Compound. I am now well and strong and can do my own housework. I do not take medicine of any kind. It was Lydia E. Pinkham's Vegetable Compound that restored me to health."—Mrs. Robert Fairbairn, 72 Parent Avenue, Windsor, Ontario.

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

Dates to be Remembered

Annual Meeting of Nova Scotia Fruit Growers' Association, Middleton, N. S., Jan. 28th, 29th, 30th, 1913

P. E. Island Prov. Seed Fair, Summerside, P. E. I., March 4, 5 and 6, 1913.

Annual meeting Canadian Holstein-Friesian Association, Temple Bldg., Room 1, Fourth Floor, Toronto, Feb. 6th, 1913.

upon my hand, listening to the doleful performance of Mr. Mell, and conning to-morrow's lessons. I picture myself with my books shut up, still listening to the doleful performance of Mr. Mell, and listening through it to what used to be at home, and to the blowing of the wind on Yarmouth flats, and feeling very sad and solitary. I picture myself going up to bed, among the unused rooms, and sitting on my bedside crying for a comfortable word from Peggotty. I picture myself coming downstairs in the morning, and looking through a long ghastly gash of a stair-case window at the school-bell hanging on the top of an outhouse with a weathercock above it; and dreading the time when it shall ring J. Steerforth and the rest to work. Such time is only second, in my forboding apprehensions, to the time when the man with the wooden leg shall unlock the rusty gate to give admission to the awful Mr. Creakle. I cannot think I was a very dangerous character in any of these aspects, but in all of them I carried the same warning on my back.

Mr. Mell never said much to me, but he was never harsh to me. I suppose we were company to each other, without talking. I forgot to mention that he would talk to himself sometimes, and grin, and clench his fist, and grind his teeth, and pull his hair in an unaccountable manner. But he had these peculiarities. At first they frightened me, though I soon got used to them.

CHAPTER VI.

I Enlarge My Circle of Acquaintance.

I had led this life about a month, when the man with the wooden leg began to stump about with a mop and a bucket of water, from which I inferred that preparations were making to receive Mr. Creakie and the boys. I was not mistaken; for the mop came into the schoolroom before long, and turned out Mr. Mell and me, who lived where we could, and got on how we could, for some days, during which we were always in the way of two or three young women, who had rarely shown themselves before, and were so continually in the midst of dust that I sneezed almost as much as if Salem House had been a great snuff-box.

One day I was informed by Wr. Mell that Mr. Creakie would be home that evening. In the evening, after tea, I heard that he was come. Before bedtime, I was fetched by the man with the wooden leg to appear before him.

Mr. Creakle's part of the house was a good deal more comfortable than ours, and he had a snug bit of garden that looked pleasant after the dusty playground, which was such a desert in miniature, that I thought no one but a camel, or a dromedary, could have felt at home in it. It seemed to me a bold thing even to take notice that the passage looked comfortable, as I went on my way, trembling to Mr. Creakle's presence; which so abashed me, when I was ushered into it, that I hardly saw Mrs. Creakle, or Miss Creakle (who were both there, in the parlor), or anything but Mr. Creakle, a stout gentleman with a bunch of watch-chain and seals, in an arm-chair, with a tumbler and bottle beside him.

"So!" said Mr. Creakle. "This is the young gentleman whose teeth are to be filed! Turn him round.-'

The wooden-leg man turned me about so as to exhibit the placard; and having afforded time for a full survey of it, turned me about again, with my face to Mr. Creakle, and posted himself at Mr. Creakle's side. Mr. Creaklefs face was fiery, and his eyes were small and deep in his head; he had thick veins in his forehead, a little nose, and a large chin. He was bald on the top of his head; and had some thin wet-looking hair that was just turning grey, brushed across each temple, so that the two sides interlaced on his forehead. But the circumstance about him which impressed me most, was, that he had no voice, but spoke in a whisper. The exertion this cost him, or the consciousness of talking in that feeble way, made his angry face so much more angry, and his thick veins so much thicker, when he spoke, that I am not surprised, on looking back, at this peculiarity striking me as his chief one.

"Now," said Mr. Creakle. "What's the report of this boy ?"

"There-s nothing against him yet," returned the man with the wooden leg. "There has been no opportunity."

I thought Mr. Creakle was disappointed. I thought Mrs. and Miss Creakle (at whom I now glanced for the first time, and who were, both, thin and quiet were not disappointed.

"Come here, sir!" said Mr. Creakle, beckoning to me.

"Come here!" said the man with the wooden leg, repeating the gesture.

"I have the happiness of knowing your father-in-law," whispered Mr. Creakle, taking me by the ear; "and a worthy man he is, and a man of a strong character. He knows me, and I know him. Do you know me? Hey?" said Mr. Creakle, pinching my ear with ferocious playfulness.

"Not yet, sir," I said, flinching with the pain.

"Not yet? Hey?" repeated Mr. Creakle. "But you will soon. Hey?"

"You will soon. Hey?" repeated the man with the wooden leg. I afterwards found that he generally acted, with his strong voice, as Mr. Creakle's interpreter to the boys.

I was very much frightened, and said I hoped so, if he pleased. I felt, all this while, as if my ear were blazing; he pinched it so hard.

"I'll tell you what I am," whispered Mr. Creakle, letting it go at last, with a screw at parting that brought the water into my eyes. "I'm a Tartar."

"A Tartar," said (he man with the wooden leg.

"When I say I'll do a thing, I do it," said Mr. Creakle; "and when I say I will have a thing done, I will have it done."

"—Will have a thing done, I will have it done," repeated the man with the wooden leg.

"I am a determined character," said Mr. Creakle. "That's what I am. I do my duty. That's what I do. My flesh and blood," he looked at Mrs. Creakle as he said this, "when it rises against me, is not my flesh and blood. I discard it. Has that fellow," to the man with the wooden leg, "been here again?"

"No," was the answer.

"No," said Mr. Creakle. "He knows better. He knows me. Let him keep away. I say let him keep away," said Mr. Creakle, striking his hand upon the table, and looking at Mrs. Creakle, "for he knows me. Now you have begun to know me too, my young friend, and you may go. Take him away."

I was very glad to be ordered away for Mrs. and Miss Creakle were both wiping their eyes, and I felt as uncomfortable for them as I did for myself. But I had a petition on my mind which concerned me so [illegible] that I couldn't help saying, though I wondered at my own courage:

(Continued next issue.)

To Prevent Chapped Skin

—use warm water and Baby's Own Soap.

The warm water opens the pores of the skin and the minute particles of pure refined vegetable oils which form the creamy, fragrant lather of Baby's Own Soap are absorbed into the skin, keeping it soft, healthy, and preventing cracks and chaps.

A perfect rinsing, then smart rubbing when drying guarantees a fine smooth skin in any weather.

Why Farm Women are Over-Tired.

So many things tend to make the women of the farm tired, who can enumerate them all? I do not think the farmer is indifferent to his wife's comfort, but quite the contrary. There is no other example of the marital relation, and home life so nearly ideal as that found in the farm home. The farmer and his wife work together every day in the year, they learn to know, trust and rely on each other as such intimate association only affords. That a husband under these conditions wil, deliberately allow his wife to become overworked, is not at all likely, but of course there are exceptions to this rule, and for the unfortunate women so unhappily situated, too much cannot be said in condemnation of the human practice. From the experience gained from living nearly half a century on a farm, with intimate associations with farmers and their wives I do not know of half a dozen instances where the husband has not been good to his wife, but I do know of countless cases where he is noble and manly, unselfishly good and kind to his wife and family, a truely ideal husband in the highest sense of what constitutes real manhood, scorning a mean or contemptible act; that such a man would fail in all true courtesy toward his wife is not possible. The underlying principal governing the life of the farmer's wife rests with herself, after all is said and done, it is not what someone else says or does that makes or breaks our lives, but what each one says and does himself or herself.

We know farm women work hard, for modern conveniences cost money, and in the majority of their homes affluence is out of the question, and so many unexpected expenditures are constantly springing up, it is hard to decide how best to utilize to the greatest advantage what little profits are secured, and if there is any sacrificing to be done, from time immemorial, it has always been the wife and mother who does that. It is these selfless farm mothere, for on the farm true motherhood is oftenest found, who think first of their loved ones to give them for their comfort and happiness, all that it is in their power to give, who wear the tired look, the mark of supernal service.

PARENTS RESPONSIBILITY

A mother once said to me: "We, who are parents are responsible for our children's existence, should place their happiness and good before our own desires, this we rightly owe them as their due." That is the highest and noblest conception of true parenthood, but in so doing no parent should fail to take into account that rightly to perform this duty, it is necessary to maintain a perfect standard of mental, moral and physical perfection themselves. And no human being can do this when exhausted with overwork. That physical conditions largely affect the mind is too well known to be discussed here. There are comparatively few things a normal person cannot do if he really sets himself about it, the chief point is to take for a motto "What others have accomplished, I can do," and live by that resolution. One of the most trying things we as women of the farm have to contend with, it seems to me, is the water question, and it is so difficult to overcome as comparatively few homes are so situated that a natural gravity ystem can be installed, but where this can be had, it is the cheapest and most satisfactory of any. Forcing by hydraulic ram or gasoline engine is possible only occasionally, but a cistern is always available, and no farm home should be without one, and yet I know of very many who heve not even this. With one, or an attic tank,

THIS *handy farm wagon* is built low (which saves time & labor loading and unloading) and will carry the heaviest load—anywhere a horse can travel. And because it never needs repairing, it's the mosteconomical wagon on the market

T-A Handy Farm Wagons and Wide-Tire Steel Wheels

Equip your *old* wagons with T-A Wide-Tire Steel Wheels and they'll be *just as good as new.* And besides they'll carry 25 to 50 per cent heavier loads.

YOUR VITALITY CAN BE RESTORED

Strong, vital, healthy manhood fascinates all who come within its influence. As true as you are a living, breathing human being, I can restore your VITAL strength; there is not a shadow of a doubt as to what I can thus do. BUT there is a single condition, one restriction I put, a certain solemn promise I exact from you before you can exact a promise from me; namely: you must unconditionally agree now at once and forever to discontinue all dissipation; with this out of the way I will do the rest. Remember what I say; no matter what your present condition; no matter what has happened in the past, just forget it and put yourself in my hands; everything will come out as you wish it. I use no drugs, no lotions, no medicines; I place no foolish restrictions upon you; just lead a natural life, get all the enjoyment you possibly can, but cease dissipation; always remember that. I can then restore your vital energy: I can take you out of the half-man class and put you in the spotlight of full, healthy, contented vigor; I can make you feel young again and keep you feeling young to a ripe old age, because I drive into your system the one thing which keeps the whole organism in balance, namely, VITALITY. My HEALTH BELT with suspensory attachment is the greatest single self-treatment remedy or VITALITY RESTORATIVE that the world has ever known, or probably ever will know. It is worn comfortably about the waist all night and every night for two or three months. Thus while you are sleeping it sends a great, soft, potent, life-giving current of VITAL FORCE into your blood, your nerves and your organs. There is not a moment's wait. It helps you immediately; it commences from the first time worn, to show you the sunshine of new energy; it takes the kink out of your back in one night; it makes a man of you after you have given up in despair, simply because it supplies you with VITAL POWER—which means health. Just stop to think. You have the same organs, nerves and fibre, the same make-up exactly that healthy, vigorous men possess, the only difference being you are under tone; you need a foundation of NEW VITAL RESERVE, and it is this I give you. There is no reason why you should not be as strong, healthy and vigorous as the best fullest-blooded man of your acquaintance. The matter is easy if you do your part. Never mind about buying a HEALTH BELT as yet; first get in communication with me; read over my booklet, and if you want to do so tell me your physical ailments that I may advise you; then a little later we can arrange in some way for you to try my HEALTH BELT. But first fill in the coupon and get the book free, or call at my office. My HEALTH BELT also cures Rheumatism, Kidney, Liver and Stomach disorders.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing oa strong. Write or call to-day. Hours, 9 to 6.

All Skin Diseases

ARE OCCASIONED BY

BAD BLOOD.

No one can expect to be free from some form or other of skin trouble unless the blood is kept in good shape.

The blood can easily be purified and the skin disease cured by the use of Burdock Blood Bitters, that old and widely known blood medicine.

It has been on the market for over 35 years and its reputation is unrivalled.

Mrs. Lillie Mitchell, Guelph, Ont., writes:—"I was troubled with eczema. My body was covered with awful itching skin eruptions. Although I tried many different remedies I could get nothing to give me relief. Finally I got a bottle of Burdock Blood Bitters, which completely cured me."

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Gates' Nerve Ointment
For Frost Bites

C. Gates, Son & Co.,
Middleton, N S.

Gentlemen:--I had the misfortune to freeze my toe which caused me a great deal of suffering, and although I had it treated, yet without success till I used your Nerve Ointment, which has completely cured it, and I have no hesidency in recommending it to others as the best I ever used,

Yours sincereiy,
Matthew Wood,
Point Phillip, N. S.

Persons troubled with partial paralysis are often very much benefited by massaging the affected parts thoroughly when applying Chamberlain's Liniment. This liniment also relieves rheumatic pains. For sale by all dealers.

except during an unusually dry season, the daily supply of water for most purposes would be then directly at hand without the labor of carrying in a pail from the pump or spring, often situated at some little distance from the house. Even without the necessary fixtures to have it in different parts of the house, a kitchen sink and pump is a great saving of labor. Mine is in a large pantry, where is also my work table, and in the bathroom adjoining, another pump leads the water directly in the wash bowl, the tub is opposite with only a drainage pipe, as when taking a bath it is necessary for the cold water to be carried to the tub, while the warm water is heated on the kitchen range. At very little expense a tinner will make an extension to go on the spout of the pump. When cold water is wanted in the tub, this is attached to the pump spout and the water is pumped directly into the tub. We find this arrangement satisfactory, and is best we could do, for our location is such that a well furnishing an inexhaustable supply is impossible. Any farmer can fix a place similar to ours by having the pipes and elbows cut the required length when purchasing them and the cost is very little as compared with the benefits derived from taking a tepid bath at bedtime after a hard day's work in summer. The pores continually exhude waste matter, and assisting nature by frequent bathing, aides the body by the least possible resistence to maintain normal health.

HOME CONVENIENCES

Most farmers possess all kinds of up-to-date machinery, and yet the women in these same homes too often still churn and do the family washing, if not on a board, with a machine turned by hand. A gasoline engine of sufficient horsepower, with all the equipments necessary to do this work can be purchased for less than $180. A binder is used only a few days during the entire year, but washing has to be done half a hundred times and churning, during hot weather three or four times each week, both of which are too hard for any woman to do. Since the men do not cradle and bind the grain as their grandfathers did, neither should the women do their work by old-fashioned methods. Another thing that wears on women and prevents them from properly recuperating during the comparatively idle months of winter is lack of adequate heating facilities. Of course a furnace is a fine thing but out of the question where fruits and vegetables in any quantity are to be successfully stored. Few homes, I find, keep more than two fires, and at that, allow the kitchen range to go out at night. Starting the fire is often done by the housewife, and to do this on a bitter cold morning, and prepare breakfast in a kitchen where everything is cold, causes bodily discomfort that cannot fail but leave its mark on the system. If only one continuous fire is afforded, I should by all means have it in the kitchen where the work is done, and kindle the living room fire after breakfast. In my own home the chimneys are built in the second story only, the pipes entering a radiator in the rooms above before going in the chimney, by this method no heat is lost, and the chambers are always comfortable in the coldest weather. It seems to me that we should make the most of the winter months, for rest and recreation after the strenuous labor of summer.—Magdelene Merritt in N. E. Homestead.

The latest silk petticoats are provided with a safety pocket for carrying money, etc. The pockets are put above the deep ruffle and fasten with patent fasteners.

FLORICULTURE.

H. S. J., St. John, writes:—How shall I treat my Relargeniums to have them bloom early in the spring?

My own practice which has always proved successful is as follows; Early in June, I cut back severly young plants of previous years' growth and plant them out-side in well drained, rather poor soil, with a sunny exposure. By the middle of August they will have made a strong sappy growth for cutting. I select shoots that have not yet formed buds and three inches or more from the tips. Cut the shoots half way through. This process is called air layering. In a week or ten days the cut surface will have a callous formed on it ready to emit rootlets when the cutting is potted up. If the weather is wet for a few days after the callous formed I have seen roots emitted into the air before the cutting was detached from the plant. This method of air layering is a good one for propagating cuttings from all soft wooded plants grown in the open air. As soon as the cuttings are well callouse-ed, detach from the plant and pot them in 2 or 2½ inch pots, using a sharp sandy soil. Pot them firmly; water well, and never let them dry out; shade from sun and spray daily for a week or so, after that give them all the sun and air you can. By the last of November the small pots will be filled with roots. Repot into 4 inch pots with good drainage, using a rich light soil and giving all that have made a few inches of growth a pinch back to make them stalky. Give sun, air and all the water they need. With a winter temperature of 50 degrees at night, by the middle of winter the soil will be filled with roots and the earlier varieties will be in bud. Do not repot them until after the first rain, later they can be potted into six inch pots. When these are filled with roots they can be safe ly fed with liquid manure.

If at any stage of growth the plants are over-potted, it will increase the amount of foliage at the expense of bloom. In autumn, if you wish to carry your old plants over, do not repot them but cut back all strong and straggling growth and keep them on the dry side but not allowing them to dry out wholly until new growth appears, then increase water and when strong growth is established again repot into pots, one or two sizes larger, and treat as fore. Stock plants can be plunged outside in pots and used for cuttings as above but if root bound they should be repotted before being plunged out.

Those who have been giving pot-bound plants stimulants for some time had better, for a change, top-dress the pots first, removing all the top soil possible withaut disturbing the roots too much, with a compost of rich soil.

Farmers Who Fail To Pass

When a high-school pupil fails to pass his examinations, or drops behind in the routine work of his studies, it is on him that his parents and it belongs in most cases, but, says his teacher place the blame. To him Youth's Companion, not in all, and perhaps in any case not at all. His parents, too, have a responsibility, and it is often they who have "failed to pass," rather than the boy.

The school provides opportunities for learning; the parents must see that the child uses them. Do you point out to your boy the personal and the businese value of an education? Do you help him to select the courses that will be most useful to him? Do you see that he has a definite time for study, and that during that time he is not interrupted? Do

McDonald's Seed Catalogue for 1913

This finely illustrated book tells you about all that is best in seeds. Vegetables and Flowers, Grains and Grasses--they are all here, accurately described and correctly illustrated. It will pay you to know about

McDonald's Tested Seeds

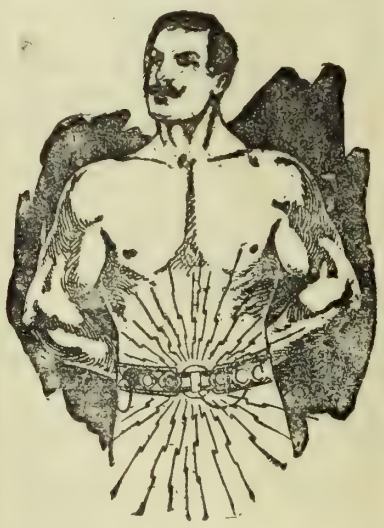
the kind that grow big, bountiful crops, and have earned the confidence of many of the most critical farmers and gardeners in Canada.

It also lists our full line of labor-saving Tools and Implements; also practical Poultry Appliances. If you want to get the maximum of pleasure and profit from farm, garden or poultry, this handsome book will help you. It's full of hints and information that can save money for you.

Write to-day before you forget. A post card will do.

KENNETH McDONALD & SONS, Ltd., Ottawa, Ont.

THIS IS TO YOU!



Young or Old, Whose Strength is wasted, Who Feel Old and Rusty with Pains and Aches, Who, from Any Cause, have lost the buoyant spirits, the courage and confidence which belong to perfect health. To you I offer new life, fresh courage, and freedom from the effects of past neglect.

Show me the persons who would not be better than they are. It matters not how the rocks and shoals of life have dulled the enthusiasm of youth, and left the nerves less vigorous, the eyes less bright, the step less springy, the mind less forceful and the general vitality less powerful than they ought to be at your age, you want to be strong.

Hard work wears, dissipation and worry, disappointment and the other cares of life drain away the vim and snap of perfect health. Electricity applied my way restores them. It makes you feel young; it renews the fire of youth, the spice of life.

Dr. McLaughlin's Electric Belt

has made thousands of homes happy. It is as good for women as for men. Man and wife can use the same Belt. The regulator makes it strong or mild to suit the wearer. It is the only Electric Belt in the world that can be regulated while on the body. You feel the power, but it does not burn and blister, as do the old style bare metal electrode belts. If you are weak or in pain it will cure you. Will you try it ?

Dr. McLaughlin: Joggins' Mines, N. S.
Dear Sir,—I have worn your belt for four weeks, and am well pleased with it. It has done me a great deal of good. My back don't bother me so much, and I have no losses this last fortnight. Wishing you success with your Belt. I remain yours truly, JAMES FOWLER.

Dr. McLaughlin: Paris Sta., Ont.
Dear Sir,—I have been wearing your Belt for 30 days and I feel that it has done me a lot of good. The losses have stopped almost altogether, and my nerves are much stronger than they were. Yours very sincerely, GORDON DUNN.

Dr. McLaughlin: Island Lake, Alta.
Dear Sir,—I purchased one of your Belts some time ago and it has done me a great deal of good. I did not think anything would help me as it has done. I have told nearly every one that I know of your wonderful Belt. and a lot of them have got one and are not disappointed.
Yours truly, MRS. T. WHITE.

MR. JEROME SCANLON, ANCESTER. ONT., writes :—I have been wearing your Belt a month, and I am very much improved in health. I have gained over 7 lbs. in weight. Those pains have never returned since wearing the Belt. I have developed quite a bit in muscle and strength. I do not desire to urinate so often, and I have had only one headache since. My bowels keep regular. Wishing you every success in your grand undertaking.

you provide a quiet place for him to study in, or must he prepare his lessons in the midst of all the distractions of a family evening? When the has a hard problem to solve, do you work it out for him, or do you give him the judicious help that will enable to work it out himself. Do you make him take daily exercise in the open air? Do you see that he has nine hours of sleep every night, so that he can go to school fresh and alert? Do you insist that he eat a good breakfast? Do you try to prevent him from scattering his mental and physical energies by going to theatres, dances, picture shows, and club meetings, or loafing about the street corners during the week? Do you know your child's teachers, and do you ever go to school to talk over with them his progress, and to find out what his difficulties are?

If you will answer these questions honestly, you will know whether it your child who has "failed to pass," or you.

Home Life

Home should be something more than merely a shelter from the elements, or a place to eat and sleep, or in which to show the worst side of our character.

There is no one on earth so dear as those bound to us by the links of home; yet how many of us keep our sweetest smile, our softest tones, and best behavior for the stranger, showing such a dearth of kind words or deeds to our own, that some day we would give the world to call them back again that we might at least tell them we loved them. I shall never forget the cry of a mother whom an accident had bereft of husband and child.

The husband and wife had parted in anger that morning. There was little time for love-making anyway in their busy lives, but her cry of "Oh John, if I had only given you and Bennie one kind word this morning I could bear it better," told its own story. Now that both were deaf to her cries, the caresses she gave them were too late.

The old maxim, "Never let the sun go down on your anger," should read, "Never let a loved one depart in anger, because ye know not what even the passing moment may bring forth."

A Door that Bangs Against the Wall.—It is quite easy to prevent this. Take an old cotton-reel, put a bit of wadding round it, and cover with a dark material as near the colour of the carpet as possible. Pass a long brass-headed nail through the reel, and drive it into the floor a few inches from the wall.

Biting The Finger Nails

It is simply a waste of time to apply ill-smelling and nasty-tasting substances to the finger-nails of children for the purpose of breaking up the habit of biting the nails. By some means or other they rub the disagreeable stuff off and go on with the same process of gnawing.

A physician recommends manicuring. Let the child's nails be examined a dozen times a day if necessary, and see that there are no little points or irregularities to annoy the little one. Everybody knows that a hangnail or a broken bit of nail will create a tendency to scrape the nail or to bite at it. Persistent and habitual biting of the nails is proclaimed a nervous disease, and constitutional treatment is in order in connection with the manicuring. It is a good idea to cultivate in children a good deal of pride in their appearance; this helps the treatment,

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

Here is a remedy that will cure your cold. Why waste time and money experimenting when you can get a preparation that has won a world-wide reputation by its cures of this disease and can always be depended upon? It is known everywhere as Chamberlain's Cough Remedy, and is a medicine of real merit. For sale by all dealers.

Death of Baron's Pride.

The greatest Cyldesdale stallion on record, Messrs A & W Montgomery's Baron's Pride (9122)' died in his box at Banks, Kirkcudbright, on Friday evening, 20th inst., after no illness at all. His faithful attendant, David Burns, put him in his box in the corner of his paddock as usual in the evening. A short time thereafter his little girl told him that she thought she heard Baron's Pride groaning. David went at once to see what was wrong, but the old horse was dead. Baron's Pride was bred by Messrs R. & J. Findlay, Springhill, Baillieston, and was foaled on 7 th May, 1890. He had thus reached the same age as Prince of Wales (673) and MacGregor (1487), both of which died in their twenty-third year. He was the most celebrated of all the sons of Sir Everard (5353), and was got when that horse had the Glasgow premium for son in that district, in 1889. His the second time, but on his first seadam was Forest Queen (7233), by Springhill Darnley (2429), a magnificent big son of Darnley (222), which won second prize at the H. and A. S. show at Stirling in 1881, and his grand-dam came from the Shotts and Holytown district. As a yearling and two-year-old Baron's Pride was exhibited by his breeders at the local and county shows with moderate succese. In 1892 he was placed second at Hamilton to the big horse Sterling (9425), afterwards well known in Cumberland, the fault laid against Baron's Pride being that he was rather wide between the stifles! He travelled locally as a three-year-old, and as the event proved, left some notable breeding and prize stock. In the spring of 1894 he was purchased by Mr. Wm. Montgomery, and by that time quite a number of prominent horse owners had their eye on him. He was at once placed by Messrs. A. &W. Montgomery at the head of their stud, was exhibited by them for the first and only time at the H. and A. S. show at Aberdeen in July, 1894, where he was first in his class, and champion stallion, and in the following year began to build up his unprecedented record as a breeding horse. He topped the list of Clydesdale breeding sires without a break until 1911, when he was passed by his own son, Baron of Buchlyvie, and established a unique reputation as sire of a number and sound progeny. He was possibly the soundest Clydesdale stallion ever foaled. Up to the last he cost nothing at all for veterinary attendance. His feet, joints, and legs were to the end of his days like those of a four-year-old—clean, flat, hard, and free from any kind of malformaeion or disease. He had a singularly mild and equable temper, and was never excited. Summer and winter he occupied his paddock and loose box, except on the few occasions when he was hired to districts in Wigtownshire and the Stewartry.

To even name his progeny which took the highest honors would be impossible. Only a few weeks ago we received a New Zealand newspaper with a report of the Otago Agricultural and Pastoral Association's annual horse parade at Dunedin. The champion of that parade, winning both the challenge and the champion cups, was James Patrick's Baron Bold, the Scots-begotten, but Australian-foaled son of Baron's Pride. The correspondent who sends us the paper writes on the photograph, which shows a great horse: "Let them all come; he is out on his own every tme." The reserve champion was James Patrick's three-year-old Baron Sandy, a son of Baron Bold, and the third prize three-year-old was also his son. Baron's Pride undoubtedly revolutionized the ideas of draft horse breeders in New Zealand, and to a large extent he did the same at home. His female progeny are mar-

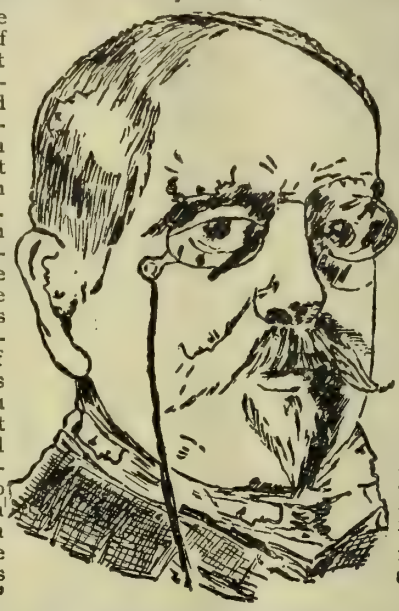
FREE!! $200.00 IN CASH

AND 100 VALUABLE PREMIUMS GIVEN AWAY

1st Prize, $50.00 in Cash. 3rd Prize, $35.00 in Cash.
2nd Prize, $40.00 in Cash. 4th Prize, $25.00 in Cash.
5th to 9th Prizes, each $10.00 in Cash.

Herewith will be found the picture of an old man. About his head and shoulders are concealed the faces of his seven daughters. Can you find them? It is not easy, but can be accomplished. Try—You may win a cash prize by doing so. Many have done this as will be shown by the names and addresses published below. If you find the faces mark each one you find with an X cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them."



Write these nine words plainly and neatly, as in case of ties, both writing and neatness will be considered factors in this contest.

This may take up a little of your time, but as there is TWO HUNDRED DOLLARS in cash and One Hundred premiums given away, it is worth your time to take a little trouble over this matter.

Remember, all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found all the faces and marked them."

We do not ask You to Spend One Cent of Your Money in order to enter this Contest.

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over One Thousand Five Hundred dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This competition will be judged by two well known business men of undoubted integrity, namely, the advertising Managers of the Montreal Daily Herald and Montreal Daily La Presse, whose decisions must be accepted as final.

Below will be found a partial list of the names and addresses of a few persons who have won some of our larger prizes in recent contests. Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity. Your opportunity to win a good round sum is equally as good as that of anyone else, **as all previous winners of cash prizes are debarred from entering this contest**

vellously true to Scottish type, and as a rule exceptionally good breeding mares. Perhaps the greatest of them as show mares have been Chester Princess, Pyrene, Jeanie Deans, Royal Ruby, Harviestoun Baroness, Lady Victoria, Cedric Princess, Blossom of Newhouse, Moira, and Nerissa. Out of 16 mares whirh during the past 20 years have won the Cawdor cup, nine have been his daughters, and it is a notable fact that of all the Cawdor cup winners they have been the best breeding mares so far as their ages enable a judgment to be formed on that point. It is difficult to particularise his sons. The most successful breeding horse among them is undoubtedly Baron of Buchlyvie (11263), but perhaps the greatest show horse has been Everlasting (11331). The records of such horses as Silver Cup, Pride of Blacon, Revelanta, Fyvie Baron, (14681), Baron Fyvie (12451), Benedict, Scottish Crest, Royal Edward, Ruby Pride (12344), Lord Ardwall, Casiabianca, Baron Kitchener, and Premier Baron (15984) would have made the reputation of any sire, but they are not a tithe of the useful breeding horses which from first to last have claimed Baron's Pride as their sire. On both sides of the Atlantic, as well as under the Southern Cross, the sons and daughters and grandsons and granddaughters of Baron's Pside have led the way, and with his passing the way is open for a new king in the Clydesdale world.—Scottish Farmer.

Poultry Plucking Apparatus.

Mr. L. A. Haszard, the well-known poultry enthusiast, has designed a plucking apparatus, which he will have patented. It consists of a piece of wood about fifteen inches long attached at right angles to another piece about the same length. The latter contains notches in which the legs of the fowl can be firmly locked so that plucking can be done with both hands. The lower section of the apparatus revolves so that the fowl can b? turned round during the plucking process.—Ex.

A Great Convention at Halifax.

The annual Convention of the salesmen and managers of Brandram-Henderson, Limited, was held at Halifax just before the end of the old year. It was attended by all the firm's representatives east of the Great Lakes, but not by those from farther west. To have brought far western men to the seaboard, would have meant absence from their homes at Christmas time, and this would have been unfair to their families.

Previous Sales Conventions held by Brandram-Henderson have always taken place at Montreal, but it was thought well to come to Halifax on the occasion referred to and for several reasons. Many of the Quebec and Ontario travellers had never been in the Provinces, and it was felt that they should have a chance to become acquainted with the progress this section of Canada is making at the present time. Again there was the fact that Halifax is the place where Brandram-Henderson started business, and it was felt that a visit to the original office and plant, would be an inspiration for the salesmen starting out for another big year. But there was still another reason. Brandram-Henderson are large manufacturers of varnishes; they have a splendid reputation for the quality of the article they make, and as it is at the Halifax branch that their whole supply is produced, there were impressive educational features involved in having the salesmen inspect the factory.

Two days of the Convention were given to discussions of methods on in creasing Brandram-Henderson sales for 1913. The year 1912 had been the largest in point of turnover in the history of the firm, but if possible 1913 should be still better, and after careful deliberation a policy was framed which embraces some very strong sales features. The Convention in detail and as a whole, was a great success, and at its close the firm gave the visitors a splendid banquet at the Halifax Hotel. At this banquet some very fine speeches were made, and later there was some good music, for on the Brandram-Henderson staff there is great versatility of talent. The visitors all expressed their great delight with the entertainment received and all returneh to their respective territories strongly resolved to sell more Brandram's B. B. Genuine White Lead, B-H "English" Paint and other B-H. products in 1913 than had ever been sold in any one year before.

A concrete milk-house makes milk worth more

PEOPLE are willing to pay more for milk that comes from a clean, sanitary dairy. In nearly every city such dairies charge from 50 per cent. to 100 per cent. more than others—and even then they can't supply the demand for pure, high-grade milk. You will get more value out of your cows if you properly cool and store the milk. Such milk is not only more wholesome—and therefore can be sold for a better price—it is also slower to sour than milk handled by ordinary methods. Ask for the free book,

"What The Farmer Can Do With Concrete"

IT will tell you how to build a concrete milk-house, and also describes scores of other uses for concrete around the home and on the farm. It is not a catalogue. Its 160 handsomely illustrated pages are devoted entirely to the subject—in which every progressive farmer is interested.

YOU do not place yourself under the slightest obligation in asking for the book. We do not even ask that you agree to use cement. Just sign the coupon attached to this advertisement, or send your name and address by letter or post card, and the book will be mailed to you at once. Address,

Please send me your book

Intercolonial Railway Calendar for 1913.

Bringing visions of comfortable and luxurious travel through a territory unrivalled for scenic beauty, the calendar of the Intercolonial Railway just received with the compliments of the Traffic Dept., is warmly appreciated as a happy reminder of past enjoyments and a delightful inspiration for future travel.

The calendar is as usual very handsome and is printed in exquisite taste. On a hand tooled background of maple leaves is an oval centre piece printed in quadre color showing the Ocean Limited speeding through a scene where ocean and land with a setting of fleecy clouds combine to form a very beautiful picture. Over this is the emblematic moose head encirled in a halo of scarlet with the words—"The Fast Line—The peoples Railway" in pale yellow.

Set in the four corners are reproductions of the four I. C. R. booklets descriptive of Quebec and the Maritime Provinces. The lettering is done in white with gold outline while the tab is chocolate brown with white figures showing prominently, the statuary holidays being marked by squares of shaded white and gold. On each side of the tab in white lettering on a tablet of gold are some cheerful facts concerning the splendid through trains the Ocean Limited and the Maritime Express. The design of the calendar is greatly enhanced by a surprinting of gold on the background of maple leaves. As a reminder of the Intercolonial and its fine train service it is excellent. As something both ornamental and useful for office use it is much to be desired.

Minard's Liniment Co., Limited.

Gentlemen,—I have used MINARD'S LINIMENT from time to time for the past twenty years. It was recommended to me by a prominent physician of Montreal, who called it the "great Nova Scotia Liniment." It does the doctor's work; it is particularly good in cases of Rheumatism and Sprains.

Yours truly,
G. G. DUSTAN,
Chartered Accountant.

Hands Up, Who Knows?

The following story, under the head, "Now, All Together, Where Does a Cow Wear Her Teeth?" published in the Indianapolis Star, contains so much of truth and human interest that we are reproducing it:

The assertion has often been made that a person knows least about the things with which he is most familiar—paradoxical as this may seem. A city man was visiting in the country recently and while watching a farmer milking he remembered that far back in the dim reaches of the past he had studied the anatomy of various domestic animals. The sight of the cows made the city man think. He had a hazy recollection that a cow did or did not have two jaws fall of teeth. Did or did not? Which? That was what he was not sure of. So he asked the farmer.

"Eh! Huh!" grunted the farmer, as he stopped temporarily his task of directing a stream of milk towaed the family cat, which was sitting on his hind legs with wide open mouth, catching the lacteal stream with a skill born of long practice.

"I say," said the city man, "does a cow have teeth in both her upper and lower jaws; if not, which are absent? If only part are absent in one jaw, which are they, the grinders or the cutters?"

Another stream of milk went hissing toward the family cat. Then the milker spat vigorously at a perfectly innocent barn wall. When a second stream was directed at the F. C. only more slowly—painfully slow this time, as though giving the milder time to solve the problem.

"Hell, by jing, I don't know! Funny, too. Been farming thirty years. Father farmed before me. His father farmed before him. Always had a cow or two. But it was left for a city chap, who probably hasn't been on a farm more than three weeks in his life, to ask me a question that I can't answer. Jist like a little kid! Allus asking his mother fool questions."

"Well, let's find out," said the city chap. You have two cows right here. No time like the present. We'll look in Jersey's mouth if she'll permit us." But the Jersey did not take kindly to the idea and the attempt was abandoned.

SWAPPING STORIEO

The next day Snuffy and Jim, who lived down the road "a little better'n a mile," came up to Buck's to see the city chap and swap stories. It was the heyday of the farmers. The three had just finished shucking down in the bottoms and all had had an exceptionally good year. The summer's rush ended when the last load of corn on the ear was in the cribs and they were enjoying the relief from early spring and late retiring. After several pipes had been smoked the city chap spoke up:

"Say, Jim, does a cow have teeth in her upper and lower jaws; if not, which are absent? If only part are absent in one jaw, which are they, the grinders or the cutters?"

Jim's pipe reminded one of a mogul freight engine going up a steep grade. Then he said: "Huh? Now, a sheep I know hasn't got teeth in its upper front jaws, but a cow—well, a cow—well, darn it, I don't know. A horse has got teeth all around. So's a pig. Turkeys haven't any teeth at all. But a cow! I declare I don't know. Lived on a farm all my life, too. But gee, why should I ask a cow to open her mouth so that I can see if she has teeth in her upper and lower jaws; if not, which are absent? If only part are absent in one jaw, which are they, the grinders or the cutters."

WILL GIVE $500 TO SICK READERS OF MARITIME FARMER

Famous Scientist Who Originated the Now Wonderful "Home Treatment" Offers $1.00 Package Free to Sick and Ailing.

In order that every reader of Maritime Farmer who may not have heard of this wonderful "Home Treatment" may have an opportunity to test this celebrated medicine, the now famous scientist, Dr. James W. Kidd, offers to give absolutely free a full size $1.00 package to five hundred readers of this paper, to prove the wonderful claims which have been made for it. In making this offer the scientist said: "I know that there are many people who have been suffering for years with some chronic disease and many of them have spent large sums of money seeking a cure. I know that these people hesitate about investing money in medicine because they have despaired of ever getting well. Thousands have told me that story and many thousands of the same people have told me afterwards that my treatment had cured them after doctors and everything else had failed. I want to prove to a limited number—no matter what the disease, no matter how long they may have suffered no matter how blue and discouraged—that my treatment really and actually does accomplish the wonderful results that have been reported."

People who suffer from Rheumatism, Kidney Trouble, Stomach Trouble, Liver or Bowel Disorders, Catarrh, Bronchitis, Asthma, Chronic Coughs, Weak Lungs, Lumbago, Piles, Urinary Disorders, Female Weaknesses of any kind, the weak, worn out, broken-down and despondent will be delighted at the effect of a few doses. This wonderful treatment creates a fine appetite and helps the digestive organs to carry on their functions as they should. It strengthens the kidneys, too, and drives rheumatism poisons from the blood as if by magic. That is why people who try it become so enthusiastic.

Any reader of Maritime Farmer who will try this extraordinary medicine that has created so much excitement by its cures can obtain absolutely free a full $1.00 treatment by simply filling in the coupon below or writing a letter describing their case in their own words, if they prefer, and mailing it today to James W. Kidd, Toronto, Canada. No money need be sent and no charge of any kind will be made.

As this offer is limited, you should write at once, in order to be sure to receive your free treatment.

SAVING A REPUTATION.

"Snuffy, I guess it's up to you to save a farmer's reputation. Does a cow have teeth in her upper and lower jaws; if not, which are absent? If only part are absent in one jaw which are they, the grinders or the cutters?" And the city man and the two farmers that had failed sat back to listen. Snuffy gripped his false teeth more firmly, swallowed some tobacco juice in his nervousness at holding the balance of power, and then said:

"Why, sure I know. Any real farmer ought to know that. Besides, my boy went to veterinary college and—

"We all know that your boy went to veterinary college," broke in Buck, "but we don't all seem to know whether a cow has teeth in both her upper and lower jaws; if not, which are absent? If only part are absent in one jaw, which are they, the grinders or the cutters?'-

"I'm just going to tell you that a cow—"

"Pop, you come on right home. Hurry! A big dog has went and got in the warm house and is a-eatin' all the lard and mom and me's afraid and—hurry up!" A wild-eyed youngster had rushed inro the room and grabbed Snuffy by the arm and was pulling him to the door before Snuffy knew what was wanted. He turned as he went out the door and yelled back:"I was just going to say that a cow has—"

LOST TO THE WIND.

But the farmer's wife gave the door a slam, and the rest of the sentence was delivered to the wind that howled around the house and the snow that came driving down.

And the verdict was never delivered to the waiting three in the sitting room. Snuffy did not get back that day and the city chap left that night. And the city chap is still wondering whether Snuffy was going to finish with the right answer or the wrong one.

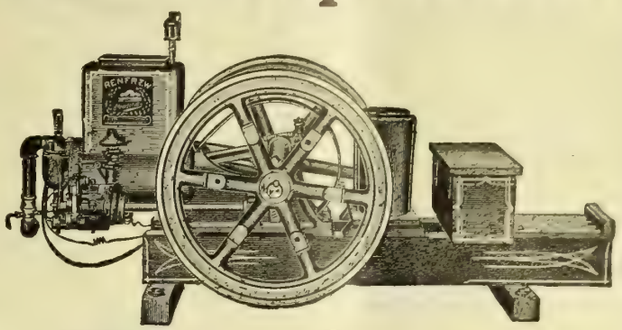
Does a cow have teeth in her upper and lower jaws; if not, which are absent? If only part are absent in one jaw which are they, the grinders or cutters?

The Success Of This Engine Has Amazed Competitors

IN the early part of October 1912, we announced in leading farm papers that we were placing on the market a high type of gasoline engine. We predicted that it would score a rapid success.

The older manufacturers of gasoline engines merely smiled at our announcement. Another make of engine among the great number in the field would never be noticed, so they thought. But as succeeding advertisements appeared and the interest of farmers in the Renfrew Standard engine continued to grow as so much talk was created by the Renfrew Standard exhibits at the big Fall Fairs, as reports from agents in the field kept coming in saying that they were losing many of their prospects who were buying the Renfrew-Standard engine, the long established manufacturers woke up to the fact that an exceedingly formidable opponent was successfully invading the field.

We must confess that the success of the Renfrew Standard engine has exceeded even our most sanguine expectations. But considering the remarkable



Renfrew Standard

perfection to which this gasoline engine has been brought—the many improvements it possesses—it is really no wonder that intelligent Canadian farmers have given it such a royal welcome.

Complete description of the Renfrew Standard gasoline engine is given in a handsomely illustrated booklet. You and every other progressive farmer will want to get posted on the latest and best type of gasoline engine for sale in Canada, so fill in and mail the coupon below.

Renfrew Machinery Co., Limited, Renfrew, Ont.

Without obligating me in any way please mail me booklet describing the Renfrew Standard engine.

Write us about the Gifford 1 1-2 h.p. engine, which we we believe is the handiest, most compact and most efficient *little* engine made.

Users of the Standard Paint Companies Products Will Not be Inconvenienced.

The plant of the Standard Paint Co. of Canada, Limited, at Lachine, Que., where Ru-ber-oid Roofing is manufactured, was badly damaged by fire on Dec. 28th last.

Fortunately most of the Company's equipment and some stock were saved enabling them to continue to supply Ru-ber-oid Roofing, Karoid Roofing, Sovereign Felt and their other products without delay.

Prompt steps have been taken to reconstruct the damaged building and replace the equipment, which was destroyed, so that the users of the Company's products will suffer no inconvenience.

Care of Bushes.

Just a word as to brushes. It is economy to buy good brushes and then take good care of them. The reason for most of us wanting to buy cheap brushes is that after we have used the brush for one job, we usually neglect it until the paint in it hardens and the brush itself is thrown away as useless. After you are through with your painting, if you will wash your brushes out thoroughly in turpentine or even coal oil so as to get all the paint out of them, they will keep in fairly good condition. Better still, however, is to make a little brush keeper which can be done by cutting off the top of a varnish can and running heavy wires directly through it. These heavy wires can be pulled in and out and run through small holes in the handles of the brushes, and in this way hold the brushes in suspension. The can is then filled with turpentine and oil, so that the bristles of all the brushes in the keeper will be covered with the liquid. Old brushes that have become hard and stiff can be easily cleaned and softened by the use of a small amount of the paint and varnish remover.

Paint is so essential on the farm that really it is a good idea to find a special place in the farmer'sworkshop and there to keep the paints, brushes and other paraphernalia. It is not advisable to allow to many odds and ends of paints to collect; they should be mixed together and used for touching up the odds and ends around the farm where appearance is not a prime factor.

Another important place for the use of paints on the farm is the protection and up-keep of the farm implements. Paint will protect the wood if applied every three or four months or at even longer intervals, and keep it from checking and cracking. Paint will keep the iron and steel from rusting, and if the implements are properly housed, instead of being left in the open exposed to the weather, the greatest efficienty and service will be rendered.

OUR Stallion Policies, covering against loss by **Death through Accident or Disease,** are more liberal and afford more protection to owners than any issued by Competing Company. They contain no vexatious clauses, having been drafted to cover **the special conditions** met with in this Country. They cover the horse no matter **where he might be** and not merely **in his own stable,** as certain Companies do. This is very important during the Breeding Season as the horse might die while being on the road. Do not **take any chances** by insuring with others, **insure with us;** The insurance premium represents only a small proportion of the service fees earned. Better risk the **loss of the premium** than the **purchase price** of your beast if it dies without insurance.

Better have and not need than need and not have.

STALLION INSURANCE

All kinds of live stock insurance transacted. *Write for particulars and address of nearest agent.*

Banner Oat Club Meeting.

A meeting of the Prince County Banner Oat Club was held in the Queen Hotel, Summerside, on Friday, December 20th., at 10.40 a. m., with the President, Rev. J. J. McDonald in the chair.

The Secretary, Mr. Thos. Waugh read the minutes of the last meeting, which were approved.

It was agreed that the time for receiving the advance for $5.00 be extended to January 10th, 1913, and that a membership fee of $2.00 be imposed on anyone joining the Club after that date.

It was agreed that the advertising be left to the President and Secretary but that the total amount expended must not exceed $100.00.

It was agreed that the President and Secretary be empowered to secure suitable stationary.

It was agreed that each member should be required to put his initials on each bag of oats accepted by the club for sale from him.

It was agreed that the President and Secretary be empowered to secure proper stencils.

It was agreed that the Prince County Banner Oat Club should authorize those of its members who were members of the Seed Fair Committee to make such arrangements as they thought best with the Seed Fair committee to give Banner Oats a very prominent place in the prize list.

It was agreed that the Secretary be empowered to purchase at once one thousand three bushel bags, and to make arrangements for a second thousand to be delivered when needed.

It was agreed that each member of the club should have a sample of his oats tested for germination as soon as possible, and that ten or fifteen pounds should be delivered in Charlottetown at the office of Mr. Alexander Campbell, insurance agent, so that the Secretary might forward samples to intending purchasers.

The correspondence was then called for, and a number of inquiries at this early date was regarded as very encouraging.

A meeting of the Seed Fair Committee was held in the Queen Hotel, Summerside, on Friday, December 20th, at 2 p. m. The President, Rev. Dr. Gauthier, presided. It was moved and carried unanimously that Rev. Dr. Gauthier, should be a commiteee to interview the Department of Agriculture regarding the deficit in connection with last year's Seed Fair.

It was moved that the regular number of prizes be offered for Banner Oats, and that the offer of the Prince County Banner Oat Club of $30.00 to increase the prizes for Banner Oats be accepted, and that a note of acknowledgement be made in the prize list.

It was moved and carried, that the prize list, as submitted by Prof. Theodore Ross be accepted, with the exception of prizes for timothy, in which changes were made. It was moved that the Household Science prizes of last year be accepted, and that a regular prize should also be offered lar best beef cut, prepared for the table and best chicken prepared for the table. It was moved and carried that last year's prizes for handicraft be accepted for this year.

It was moved and carried that Professor Ross, Rev. Dr. Gauthier and Rev. J. J. McDonald constitute a committee to further revise the prize list, if neceseary.

It was moved and carried that the Provincial Seed Fair, be held on Tuesday, Wednesday and Thursday, March 4th, 5th, and 6th.

It was moved and carried that all entries should be free up to and on March 1st, and that a fee of 5c each should be charged for all entries made after that date.

SUFFERED FROM

Catarrh of the Stomach For Thirty Years.

Catarrh of the Stomach is generally caused from some interference with the action of the liver, and is a malady that affects the whole body.

Some symptoms are burning pain in the stomach, constant vomiting, abnormal thirst, incessant reaching, etc. On the first signs of any of these symptoms Milburn's Laxa-Liver Pills should be taken. They are a specific for all disorders arising from wrong action of the liver.

Mr. Michael Miller, Ellerslie, Alta., writes:—"I take pleasure in writing you concerning the great value I have received by using Milburn's Laxa-Liver Pills, for catarrh of the stomach, with which I have been a sufferer for thirty years. I used four vials and they completely cured me."

Price, 25 cents a vial, 5 vials for $1.00, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Potash.

Potash in Canadian agriculture is chiefly used in the forms of Muriate of Potash ana Sulphur of Potash. The former is the most generally used but Sulphate of Potash should invariably be used on potatoes, sugar beets and tobacco as the chlorine content in the Muriate of Potash is liable to have a detrimental effect on the quality of these crops.

It should be remembered that artificial fertilizers are not used up by the first crop. This does not apply to Nitrate of Soda or Sulphate of Ammonia, which are generally taken up wholly by the crop tp which they are applied. An application of Potash would be only half used up by the first crop and the two succeeding crops will benefit from the remainder. From this illustration it can be seen that a farmer ought not to charge the fall cost of his fertilizers to the first crop except in the case of the nitrogenous materials mentioned.

Each fertilizer material has its own functions to perform; no one ingredient can replace another.

Potash adds to the quality and promotes the maturity of crops in addition to increasing the quantity. It is necessary for the production and transfer of strach in plants, for the stiffening of straw; it gives color and flavor to fruit and adds to the size of roots and tubers. Potash should be the dominent ingredient of a fertilizer for potatoes.

Free, educative bulletins and advice on the Economic Purchase and Use of Artificial Fertilizers may be obtained by applying to German Potash Syndicate, 1505 I. O. F. Temple Bldg., Toronto.

The P. E. I. Poultry Show.

Now, as the fifth annual poultry show has passed, and the people in general have been discussing poultry and poultry shows, and while it fresh in our memories, we should ask ourselves—are we making progress in this great industry?

Five years ago when this poultry association started we had with us a number of farmers, but today I am sorry to say, I find only one farmer who is a member competing in the open class. And had it not been for the wise provision of the government in giving them a utility class they would be entirely pushed out, as the fancy poultry is not suitable for this purpose.

Hens today are bred for special purpose, and the means employed in each case are entirely different. If you are after an egg yield trap nests should be employed, and with close observance we find the profitable hen. To stimulate this yield we have the egg contests which are being held in all parts of the world. This is only one side of the utility class. We have the fowl bred for table qualities which are as different as the dairy cow is from the beef cow. In one case, no matter how well fed, the food goes to produce milk, and in the other case to produce beef. This same rule applies to fowls.

Next in importance we have the standard bred or fancy fowls, which might be divided into a great many classes. But I will divide it into two solid and parti-colored. The latter require two separate matings, one for cockerel, and the other to produce pullets of required standard color, and they also require to be line bred or inbred to make a success of fancy fowls. So you see that the means adopted for each are entirely different and with a different aim in view.

My reason for writing this is that the farmer may not be deceived by mixing up these different classes to the ruin of his stock, as so many of late are doing. Buying purely fancy stock thinking to improve their laying and table qualities, whereas the contrary has been the result. I know of several who have ruined their stock in this way.—L. A. Haszard, Charlottetown.

The Calf and the Cow.

It is well known that if the calf sucks the mother continually she dries off very rapidly. Why? Because the surplus milk is not taken as fast as manufactured, and Nature shrinks the milk flow to the demand of the calf and to prevent injury to the mother. We all know that, if the cow is expected to produce milk to her full capacity she must be milked clean and at regular intervals. That is something the calf does not do. We further know that a poor milker will dry off the cow just as a calf does. Leaving milk in the udder is a sure way to dry the cow off. All these are old and well-settled principles, yet men will not conform to them, and so they destroy profit and injure cows. The efficiency of a cow is due to things: (1) Her born capacity, for which we try to provide by wise and proper breeding, particularly in giving her a sire that will impart that capacity to her; (2) intelligent management of the cow during her milking period. Both are supremely essential. You cannot make a good cow out of one that has no born capacity for milk-giving, no matter how well you manage. You can spoil a cow of the highest born capacity, especially a heifer in her first milking period, by careless and ignorant management. And so we see how much is involved in the simple act of letting a calf suck its mother and not taking away all the milk she produces.—Hoard's Dairyman.

MAPLE EVAPORATORS

TO THE LIVE FARMER OUR PERFECT MAPLE EVAPORATORS AND A SUGAR BUSH CAN BE MADE TO PRODUCE A REVENUE WHEN IT IS MOST NEEDED.

With our Maple Evaporator, sap is easily and economically converted into the finest quality maple syrup.

The body of the perfect evaporator is made of heavy sheet steel thoroughly riveted and braced with steel angle and fitted with cast iron door and faame.

The working of the evaporator is very simple—put the sap in at one end and it comes out syrvp at the other.

Send for illustrated catalogue.

Steel Trough & Machine Co., Ltd., 9 James St., Tweed, On

WHEREVER the old wheelbarrow cleaning system is used you find a mussy stable.

It's too much to expect that a man will brush and sweep the passage ways every time he cleans the stable. He hasn't the time for one thing—and it's discouraging work for another.

But nowadays we think more about clean stables.

We know that dirty stables breed disease.

It's up to you, Mr. Farmer, to make your stable easy to clean — then it will always be clean.

You can learn something about how to do this in Dillon's Book on Clean Stables, which is sent free to Farmers. Dillon's make a Litter Carrier that lightens work about the stable. It's an equipment any man can put up, and is adaptable to stables large or small. The free book explains it fully.

DILLON'S Litter Carrier

Figure it out for yourself. Get our free book.

Dillon's sell direct to the Farmer. There are no Agents and no Agents' profits. The price is the same to all, and lower than you would expect for such substantial and well-built equipment. DILLON'S BOOK ON CLEAN STABLES gives you an exact idea of what you can accomplish for a small outlay. Write for a free copy.

R. DILLON & SON

When Writing Advertisers Please Mention the Maritime Farmer.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initisl or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

SPRINGVALE FARM AYRSHIRES

Prize winners in the dairy tests at Amherst 1912, bred from Show Ring stock, are in my herd. A few bull calves and yearling heifers for sale.

FRED S. BLACK, Amherst, N. S.

Self-Boiled Lime Sulphur no Good for San Jose Scale.

In regard to the use of self-boiled lime-sulphur solution to combat the San Jose scale, Dr. W. E. Hinds, of the Alabama Experiment Station says:

"We cannot depend upon the heat of the lime to produce a combination that will be effective as a winter wash against San Jose Scale. I fear that the writers recommending this, confuse the preparation of self-boiled lime-sulphur for summer use for brown-rot with the fire-boiled wash for the scale. An ineffective wash means waste of the materials, labor and perhaps the ruin of the orchard also.

"There is of course, latitude for some variation in the proportion of lime and sulphur, ranging between 15 pounds and 20 pounds of each. Considering the danger of getting a poor grade of lime, and the cheapness of that material, I believe it advisable to use slightly more lime than sulphur. I would advise 18 or 20 pounds of lime and 15 pounds of sulphur to make 50 gallons of wash. It is necessary to boil this for at least 30 minutes, and better, for 45 or more, to get the most effective wash."

Writing also of a recent recommendation of "One pint of carbon disulfide on 100 bushels of corn," as a protection against the weevil, Dr. Hinds says, "this would be entirely ineffective, and would be simply so much thrown away." In a press bulletin sent by Dr. Hinds, it is stated that in tight enclosures, eight pounds of carbon disulphide for 1,000 cubic feet of space would be thoroughly effective." If the enclosure is not very tight, it will be necessary to use more, perhaps 20 pounds per 1,000 cubic feet of space.

It must be remembered that the carbon disulfide diffuses itself through-out the entire space of the bin or room in which it is placed, and the size of this enclosure, rather than the amount of grain to be treated, is the thing to be considered.

Murray Corner,
Jan. 13th, 1913.

The Maritime Farmer,
Sussex, N. B.

I received the lamp burner premium with your paper and used it. It is O. K. and I am well pleased with it and the Farmer. Yours truly,

Mrs. James Chapman.

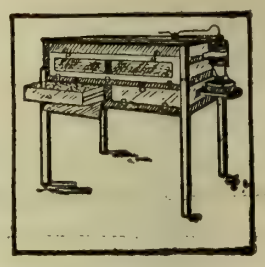
$5,000,000.00
FOR PEERLESS WAY POULTRYMEN



Into the pockets of the users of The Peerless Way last year went five million dollars made from the poultry these people raised. Yet chickens are scarce in Canada and eggs are the scarcest of all food commodities. That is positively the fact.

To-day there are not enough Canadian CHICKENS or EGGS to go around. Thousands of chickens and hundreds of thousands of dozens of eggs are being shipped into Canada from the United States and other countries to help meet the demand.

Yet there is a shortage! Eggs are commanding a tremendous price—chickens are worth dollars.

Now is the time to take advantage of this situation and make money out of it yourself. You can raise and sell 600 chickens this next year, and you will find a quick and sure market for every one of them. You can get the top notch price for all the hundreds of dozens of eggs that your poultry lay.

Let us tell you how!

Poultry raising is the best business for any farmer, any farmer's wife or farmer's child. The poultry crop is the one crop that never fails. It pays better for the time and money invested; the profit is surest; it isn't overcrowded and never will be.

Our book "When Poultry Pays," will show you. Let us send it to you. It is interesting; it is instructive, and it contains the proof.

You need this book. It will be mailed free. A post card will bring it.

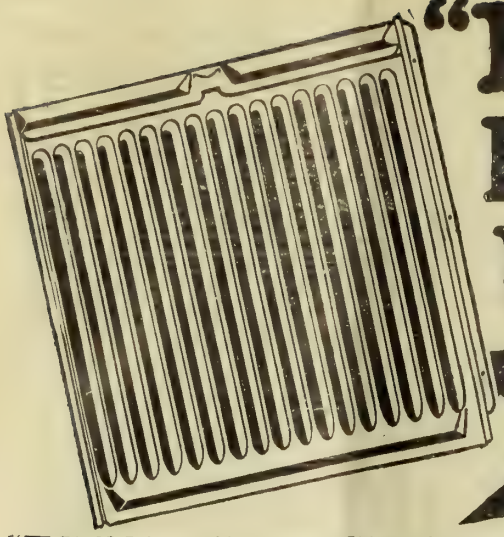
"HILLSIDE STOCK FARM"

We have for sale at right prices four Ayrshire bulls from twelve to fifteen mos. old. They are sired by the champion bull of 1911; a son of the renowned Scotch champion "Spicy Sam."

Prescott Blanchard, Truro, N. S.



"My New 'George' Shingle Is Good for 100 Years. Use it and my Corrugated Iron on Your Barn. Save the Cost of Wood."

"HERE is my big 'George' Shingle in metal, just put on the market. Every shingle covers 4 square feet. It is the most economical roof for a barn to-day, because it saves costly labor in laying, needs no repairs, requires no paint, and is good for 100 years of service."

G. H. Pedlar

"I AM making one metal shingle to-day which is used all over the world. I have just started making for sale a new and bigger shingle. This was invented by my son, the late George H. Pedlar, Jr., to cover the big roof surface of the modern barn."

"This shingle is made in 100-year metal. I found a metal that wouldn't rust on a roof, after a life-long search. I looked for that metal for 50 years. To-day you can buy it in my shingle."

"You, and I, and my son, realized how lumber is getting scarcer, high in price, and wood shingle much poorer in quality as the years go on. Lumber is used in barns to-day that would not be looked at twenty years ago. Labor asks much higher wages."

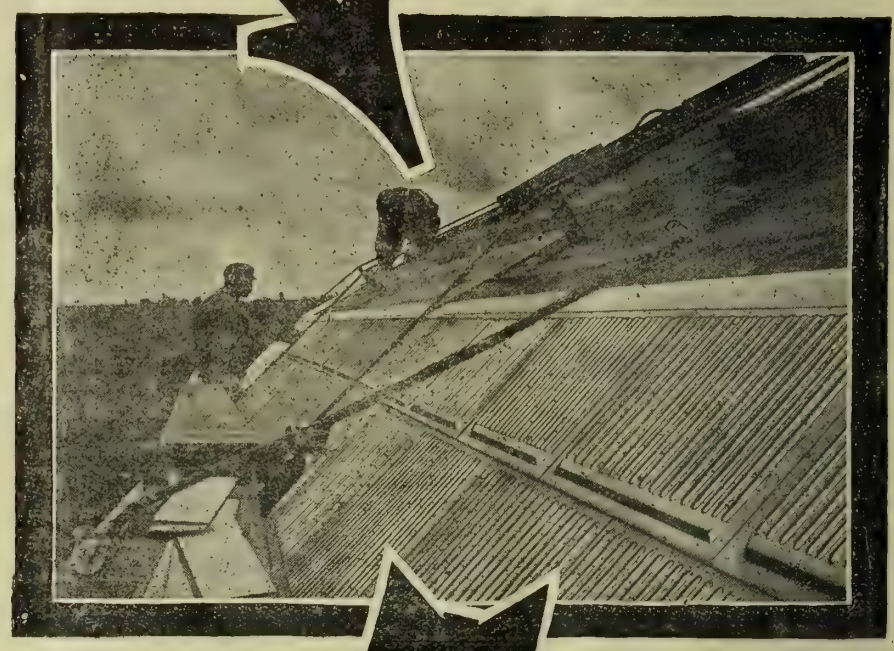
"To-day, my 'George' Shingle on the roof, and sheets of my galvanized, corrugated iron on the walls, instead of boards, makes you a better barn at less cost than an all-wood barn properly painted. It saves in the labor needed."

"I am ready to help you build a better barn than you planned, and yet save you money. Use my 'George' Shingle and my corrugated iron, and you save so much in lumber bills, repairs and paint, and labor of construction, that it pays to use my fireproof material. You get a better barn at an astoundingly moderate figure."

"I have just written you a book about this. It shows how one of these new barns is built. My galvanized, corrugated iron is used on the walls and my 'George' Shingle on the roof."

"Won't you send to me for this book, friends? I will be glad to send it anywhere. It probably will help you. It shows the most economical way to build a barn now-a-days. Write a post card for it."

G. H. Pedlar



WHY I MADE UP THIS NEW 'GEORGE' SHINGLE

"My new, big shingle is made for big barn roofs. The average barn is getting bigger every year. By using a large metal shingle on a big barn roof, the owner saves so much in labor of applying, when compared with wood, that the metal shingle becomes immediately the more economical article."

"At one stroke, I made it possible for any farmer to get a fireproof, lightning-proof and timeproof roof, which would last 100 years, with a big saving in wages, repairs, paint and upkeep."

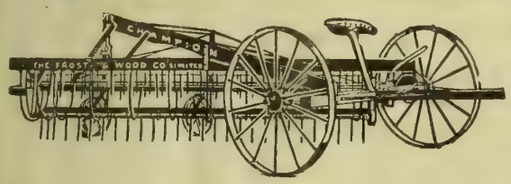
Vol. 18. SUSSEX, N. B., FEBRUARY 11, 1913 No. 9

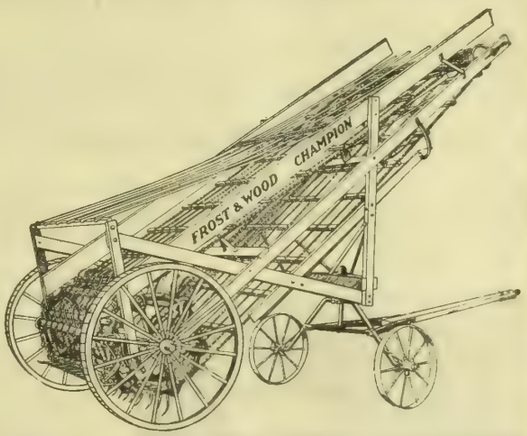
Make Haying Light Work With Frost & Wood Helpers

HANDLE your timothy, clover and alfalfa with a Side Delivery Rake and a Hayloader. Cut a field in the morning; you can then rake it in the afternoon and draw it in before night if necessary. Being able to do that with this Equipment has saved many a farmer many dollars, when a rain storm would have soaked his crop and minimized its value. Think of the work these two implements save! They will solve your help problem this summer. Once you use them you'll never go back to the old way.



THE F. & W. SIDE DELIVERY RAKE

saves the labor of dumping and leaves windrows in best possible condition for loading with the Hayloader. It automatically turns the ground side of each swath upwards, so the crop can be cured evenly and thoroughly. Well-cured hay of an even color always brings highest market prices--that's the kind a "Champion" Rake and Hayloader will make for you. It just acts like a tedder. Its teeth have an easy, regular motion--so no danger of threshing the ripe heads of clover or timothy. Rear end of rake is carried on two castor wheels--these insure perfect work on uneven land or farms with deep furrows. Materials used in this Rake are the best we can obtain--construction is simplicity itself--so there is nothing to get out of order--it is strong, rigid, well-built and capable of handling any kind of crop. Ask for our "Haymaking" Booklet.



THE F. & W. "CHAMPION" HAYLOADER

is simple—which means it won't get out of order just when you want it badly. Has the very best material in it—which means it will last and do good service for many a year. The "Champion" has the power and the height to make big loads easily. You can regulate the volume of hay put up by the speed at which the horses walk. It will put it up just as fast as it can be handled on the load. These teeth have exactly the right curves for picking up *all* the hay. The "Champion" does clean work. Side Rails are high and Carrier is covered by a windbreak, which prevents the hay being blown from Carrier in windy weather. Investigate this Loader! It will do your work as you want it done

Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, (*Licensed Architect*)

10,000 Sold in 30 Days

Price $2.00 Prepaid

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS :

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete - Proportions—Sand and Gravel—Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

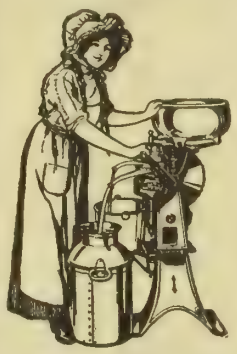
DE LAVAL
CREAM SEPARATORS

THOSE WHO *know* BUY THE DE LAVAL

CREAMERYMEN---Because they are experts in the handling of cream and know by long experience that the De Laval skims cleanest and wears longest. That is why 98 per cent of the World's creameries use the De Laval exclusively.

EXPERIENCED DAIRYMEN--The De Laval is the universal favorite among big dairymen. They know that no other separator will give them such satisfactory service.



OLD DE LAVAL USERS--Whenever a man who has used an old model De Laval decides to purchase a later style machine he invariably buys another De Laval.

MEN WHO INVESTIGATE--If anyone takes the time to investigate the merits of the various cream separators, either by finding out from other users what kind of service their machines have given or by testing other machines out against the De Laval, the chances are a hundred to one that his choice will be the De Laval. More De Laval machines are in use than any other make. There is a reason. The De Laval agent in your locality will be glad to tell you why.

Silage Would Increase Your Dairy Profits

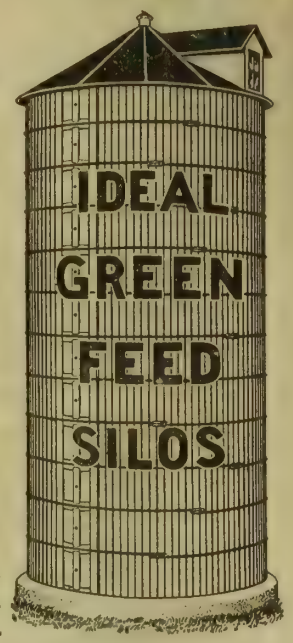
This winter weather, when dry feeding is reducing your dairy out-put, don't you often wish that you had erected a silo last summer?

If you had done so you would right now be feeding your cows succulent and milk-producing silage, just as good a milk-producing food as green summer pasturage, and getting a good deal more milk and making more profit out of your dairy.

All successful dairy men now-a-days consider a good silo a very necessary part of their dairy equipment and there is no question but that feeding silage greatly increases the milk flow.

If you haven't a silo perhaps you have made up your mind that this is the last year you are going to get along without one.

If so, don't put off ordering it until late next summer and perhaps find yourself in the same fix next year.



Write to-day for 48 page Ideal Green Feed Silo Book

This book contains much interesting and valuable information about silos, silage and silage feeding, and even if you are not yet ready to buy, you will find the book interesting and instructive.

More than twice as many Ideal Green Feed Silos were sold last year than in any previous year. If you keep cows you need a Silo. Full specifications are given in the Silo book. Be sure to write for it.

We are exclusive distributers in Canada of the World's Standard De Laval Cream Separators, and also carry a complete line of creamery and dairy machinery and supplies. If interested write for separate catalogs.

Over 500,000 Tons or 25,000 carloads of MOLASSINE MEAL were sold last year

This was distributed over practically all of the world and the sale is still increasing.

In Canada, our sales within the last three months, have doubled. Farmers realize that if they can get Pure Cane Molasses, with the Potash Salts extracted from it, thus ridding it of it's purgative effect, into the stomach of their animals, results are bound to be forthcoming.

They also realize that when their Animals chew MOLASSINE MEAL, when mixed with other Feeds, on account of its being sweet, they always thoroughly masticate all of their Feeds. These two arguments alone are sufficient to have the most skeptical give this Feed a trial. Very few have not tried it. You may be one of the few. If so, buy it TO-DAY as all dealers handle it.

Nova Scotia Farmers' Association in Annual Session.

THE Seventeenth annual meeting of the Nova Scotia Farmers' Association was held in Lyceum Hall, Sydney, N. S., on Tuesday and Wednesday, January 21st and 22nd, 1913.

R. M. Jackson, president of the Association, occupied the chair and the hall was filled with enthusiastic farmers from all sections of the Province.

PRESIDENT'S ADDRESS.

To the Officers and Members of the Nova Scotia Farmers' Association:

Gentlemen,—It is with a great deal of pleasure that I extend to you a very hearty welcome to this, the seventeenth annual convention of the Nova Scotia Farmers' Association meeting for the first time in the busy City of Sydney, at the eastern end of our fair Dominion, and it may well be called the Gateway of Canada.

Coming together again after a year of labor and effort we naturally look over the seasons as they come and go and note the results, and first of all we would express our gratitude to our Gracious God, for we have had a year of peace and prosperity; we have not been visited by either war, pestilence or famine.

The year 1911 was one of the best crop growing years that we have had for many years, while the year that has just passed, though not up to the year previous, yet when all crops are summed up, will about strike an average.

The weather conditions were somewhat peculiar, parts of the province were blessed with plenty of rain during the growing season, while in other parts, particularly the Eastern Counties, the rainfall was very light, consequently some crops were very short, especially the hay crop. The grain and root crops, where the farmers had been educated to properly cultivate the soil and to conserve the moisture from preceding rains, was up to or above the average. The hay crop of the Eastern Counties is reported to be about 10,000 tons short. It seems to me that too many farmers depend on their hay crop for their winter feed instead of growing more roots and corn to add succulence to their winter feed, and to help out in times of shortage such as is being experienced this year. I am pleased to note that a larger acerage is being devoted to the growing of roots and corn every year. The root crop has been a good one, some places reporting a yield of 1200 bus. to 1400 bus. to the acre. To get a large yield like this means that you must have good seed and give them proper cultivation.

The Fruit Crop, which is one of our leading crops, while not up to that of 1911, which was the banner year, was above the average, but owing to weather conditions was not as clean or of as good quality as the year previous.

Peices of farm products have ruled high during the year, but have we been prepared to take advantage of the high prices. Dairy products reached the highest mark for many years, and have every indication of going higher this year. Are we prepared for it? If we were to go through some of our best farming districts today you will find some of our farmers, if you can call them that, who have good sized herds of cattle, and who are today buying dairy products instead of having a surplus to sell, every cow in the herd being dry, and will be till next summer. Now this is a sad state of affairs and one that needs to be remedied.

One of the greatest needs of the farmers of Nova Scotia to day is education. Education in every day problems of farm life, such as the breeding and feeding of the different kinds of live stock, the care and application of manure and the different kinds of fertilizers, rotation of crops, underdrainage, conservation of the soil, orcharding and everything that pertains to orchard work, and the many things that go to make the difference between success and failure on our farms.

Agricultural education has been carried on in about the same way as previous years, and it is with great satisfaction that we see the increased interest that is being taken in the Agricultural College at Truro. The attendance at both courses has been increasing every year, last year the buildings being taxed to their capacity, and this year we are pleased to see a large addition being added, and we should not be satisfied until this is filled to overflowing. Those of us who never had an opportunity of attending any of the courses cannot know how much we have lost. We have been farming with a fair measure of success, but how much greater might have been our reward had we an Angricultural Education to help us.

During the past year three illustration or demonstration farms have been established in the Province, this, you will all agree, is a step in the right direction, but we should not be satisfied with three; we should have one in every polling district in the Province. There are a lot of farmers that are not able to attend the Agricultural College to learn improved methods. True, the Institute speaker helps them some; but farmers, as a rule, are a suspicious people, and say it is all right to tell us what is being done on Government Farms, and by those who have farms that are by nature good, and plenty of capital to work them with. But on a demonstration farm, operated by one of their neighbors, under directions given by experts, they can see improved methods worked out under the same conditions that they work under, and done without Government aid, and say if my neighbor can do it, why can't I?

With all these advantages for agricultural improvement, are we helping those who need help the most? To my mind, this can only be done by having men who are qualified to do so travel throughout the country districts and visit every farm, and by practical advice help our poorer farmers to increase the production of their farms.

The Provincial Exhibition, though not as successful financially as we would like to see it, was very encouraging. The live stock exhibited was as good as could be found anywhere, but the display of fruit and vegetables was far short of what we would like to see. Why is this? Are we ourselves not to blame? Are we doing our best to make the display of exhibits as large and attractive as we might? I say we are not. Outside of the few who exhibit every year there are many who could make the exhibition more attractive, and not only do credit to ourselves but to our fair Province as well.

The several County and United Counties Exhibitions held throughout the Province are doing good work and we should do our best to encourage them as they get in touch with many that do not attend the larger shows. They should glso act as feeder, of the larger Exhibitions.

A very successful Horse Show was held at Amherst last Spring, and the Winter Fair that has just closed has been without exception the best yet.

In conclusion, let me remind you, that if we as farmers would reach the goal for which we are striving, we musthave the active assistance of every member, and each meeting of this Association should mark a long step in that direction.

We have prepared, we think, a good program, and we have gentlemen with us who are well qualified to handle home we should be in a better position to fight our farm battles, and their subjects, and when we return be able to report more progress during the coming year.

I would ask everyone present to assist me in conducting the meetings of this convention, and ask every delegate to be in his place at the time appointed for the opening of each session.—R. M. Jackson, President.

Several members voiced their appreciation of the sentiments expressed in the presidential address.

DIRECTOR'S REPORT.

Gentlemen—

Last year your directors presented their annual report at the extreme West of the province, they now have travelled to the extreme east of the province to present their seventeenth one, and are pleased to meet with you in the flourishing city of Sydney. Though the distance of travel may prevent some being present who would be with us provided we were meeting nearer the centre of the province, we expect a large attendance and are glad to visit these parts and your presence shows the interest you take in the affairs relating to the welfare of the Association and agriculture. We trust you will benefit by the addresses and discussions and store up information which will be of value to you during the rest of the year.

The province of Nova Scotia is not a large one but still it is one of great prosperity and its possibilities are immense. It is agriculture that adds to the wealth of a country and we are proud of our calling, one that cannot be excelled. There is always something to learn, something new, later information available as to how to produce more and at less cost which is valuable and which should be sought out by everyone. This Association has done a great deal towards spreading the gospel of more intelligent and successful farming and in various ways has aided the social and home life of the rural communities.

As in the past meetings have been held during the year in various places through the instrumentality of County Farmers' Associations and other agencies and we gather together from various sections at this annual convention to discuss and learn what is being done in the different localities, but we should not altogether make that the only object. We feel that at this convention we should lay more stress on the first clause of the objects of the association as found in the by-laws, viz. "to confer together with a view to united action in connection with our profession." There are questions that our opinions are sought for in the administration of the Government, there are matters that we should express our minds upon so the administration will know our views in regard to what we would like them to do. On the program there are two subjects specially specified, the Duty on Traction Ditchers and the Telephone Franchise. There are, no doubt, other questions just as important and some will be brought up of more or less importance, and matters of this kind we consider should be made a feature of this our annual convention and hope to see it tend more and more that way.

Progress in Agriculture continues and we are glad to report that the Agricultural College, Exhibitions, Winter Fair and Horse Show made good advancement. The grant to Agriculture of $500,000 which the Dominion Parliament made and of which this province received it's share in proportion to its population has enabled us to add to the College buildings which through the success of and the increase and satisfactory attended a share of this appropriation to ance were so much needed. The Agricultural Societies have also receivthe amount of $3,000.

Though the Province is small various conditions as to rainfall and temperature have been experienced the east has lacked rain, the central portions have had too much and the western a happy medium, except for a short time the summer was below the average temperature. Taking the whole Province crops were fairly satisfactory.

Immigration increased somewhat and there is plenty of room for others who wish to come. Men who have had experience at farming and with a fair amount of capital are those we should encourage to settle in this fair province; they will find conditions favorable for a contented and prosperous life. These are the people the Department of Immigration should endeavor to secure, and they are doing it to some extent.

We are to be honored this year with the presence of the newly appointed Live Stock Commissioner, Mr. John Bright, one of the foremost horsemen of the Dominion. We congratulate him upon his recent appointment and heartily welcome him to this part of the Dominion. We shall also be glad to have with us Hon. E. H. Armstrong, Commissioner of Public Works. He will hear our opinions and suggestions on various matters and will be able to convey them at first hand to the Government and Legislature, and we shall expect to hear something from him.

A satisafctory balance sheet is placed before you and a good programme. We thank the Department of Agriculture for the speakers provided and we trust you will return home edified and satisfied with your visit down East.

AUDITORS' REPORT.

We, the undersigned Auditors of the Nova Scotia Farmers' Association, have examined the books and accounts of the Serretary-Treasurer, Chas. R. B. Bryan, and find them correct and neatly kept.

LIONEL STEVENSON,
J. P. LANDRY,
Auditors.

Truro, N. S., January 1st, 1913.

THE EXHIBITION COMMISSIONERS' REPORT.

which was read by R. S. Starr, one of the Commissioners, was highly gratifying to the Association. It showed that the Halifax Exhibition is making substantial progress, but the fact yet remains that the Exhibition is not so well patronized by the citizens of Halifax as it might be.

C. P. Blanchard, Truro, thought that the geographical position oi the city of Halifax was not favorable for a large attendance from the extremities of the province. He thought the object for which the exhibition was organized would be better served by having district exhibitions organized and held consecutively in various sections of the Province. Considerable discussion took place on the exhibition question. The concensus of opinion being that Halifax was the place for the Provincial exhibition and that it would be a retrograde step to do anything detrimental to the Halifax fair.

Mr. Wm. O'Brien expressed the thought that the officials of the railroads should exercise more care in the handling of live stock trains enroute to and from the exhibitions. Much damage was done to valuable live stock each year through the careless shunting and jerky starting and stopping of trains.

THE HOME ORCHARD AND THE FRUIT GARDEN.

was the subject of an interesting lecture on Tuesday afternoon by Prof. W. S. Blair, of the Experimental Station, Kentville, a synopsis of which will appear in a future issue of the Farmer.

THE REPORT OF THE SUPERINTENDENT OF AGRICULTURAL ASSOCIATIONS.

showed a flourishing condition all along the line. It showed the existence of 205 Agricultural Societies,—five more than last year,—with a total contribution of $13,253.00. Mr. Fuller emphasized the necessity of exercising stock bulls and went on to tell how some Agricultural Societies were accomplishing results by building bull paddocks for which work they received a special grant from the department.

The representatives from the various county associations reported progressive work during the year just closed.

The reporting delegates were:—Annapolis, L. W. Elliott; Antigonish, Rev., Fr. Thompson; Cumberland, C. H. Black; Digby, W. A. Beacon; Inverness, D. F. McLean; Kings, W. H. Woodworth; Lunenburg, E. H. Nichols; Pictou, H. Kennedy; Richmond, Rev. R. McDonald; West Hants, Wm. O'Brien; Yarmouth, S. P. Goudey. Yarmouth county leads in membership with a total of 605. The necessity for the introduction of more traction ditchers and cheaper tile for drainage purposes was advocated by several of the county organizations.

FARM DRAINAGE

was discussed by Prol. B. D. Landels, of the N. S. A. C. Prof. Landels address will be published in a future issue of the Farmer.

ON TUESDAY EVENING

Mayor Gunn in behalf of the citizens of Sydney and Warden Levatt in behalf of the County of Cape Breton and Jacob H. Andrews in behalf of the Cape Breton County Farmers' Association extended hearty welcomes to the visiting delegates which was fittingly replied to by H. W. Corning, M. P. P., Vice-President of the Association.

Hon. E. H. Armstrong, Commissioner of Public Works for Nova Scotia was present and added his words of encouragement as to the progress that is being made in the various industries throughout the Province, a fact which tended towards remunerative prices and increased demand for the products of the farm.

Prof. M. Cumming gave a resume of the histary and growth of the N. S.A. C. and of the good record of the students who have gone back to their farms or on to other professions. He also referred to the crops growing competitions in the various counties and particularly to the interest that men of wealth was exhibiting in the welfare of the young farmers of their native province. He spoke particularly of the Cumberland County contest in turnip growing referred to in our last issue and threw out the hint that offers such as was made last season to Cumberland and Colchester counties would be appreciated from other sources.

THE CONDITION OF THE LIVE STOCK INDUSTRY.

was discussed by John Bright, Live Stock Commissioner for Canada. He put forth a plea for more co-operation among farmers in the matter of stock breeding. The supply of good breeding females was not equal to the demand and consequently it was a mistake to allow such females to go to the block. He strongly advocated the elimination of scrub sires and the more general use of pure-bred sires.

THE TELEPHONE FRANCHISE.

A statement in referenre to the prohibitive rates which the Telephone Company is charging in Nova Scotia was read by C. R. B. Bryan and on motion it was referred to a committee consisting of C. R. B. Bryan, C. P. Blanchard, and S. C. Spurr.

THE ELECTION OF OFFICERS

resulted as follows:—

President—H. W. Corning, M. P. P. Chegoggin.

1st Vice-President—Wm. O'Brien, Windsor Forks.

2nd Vice-President—A. S. McMillan, Antigonish.

Directors—F. W. Grant, Barss Corner; Wm. Murray, Union Centre; Samuel Freeman, Amherst; E. C. Schaffner, Paradise; C. A. Munn, North Sydney.

Auditors—Profs. L. Stevenson and J. P. Landry, Truro.

Exhibition Commissianers—F. W. Foster, Kingston; and H. S. Kennedy, Alma.

GOVERNMENT GRANT TO AGRICULTURAL SOCIETIES.

The methods of allotting the government grant to agricultural societies came up for discussion. It seems that some societies include service fees and bonuses with their regular membership fees when making up their returns. Other societies draw a grant on straight membership fees and do not include service fees. The result has been that all societies do not share proportionately in the government grant. Mr. Fuller was anxious to have the wording of the Act read so that each and every society would interpret it alike and governing themselves accordingly get their fair share of the grant.

After considerable discussion it was resolved to leave the matter with Mr. Fuller for readjustment.

THE CARE AND MANAGEMENT OF SHEEP IN NOVA SCOTIA.

was the subject of an interesting talk by Jas. A. Telfer on Wednesday afternoon. As a practical sheep raiser he discussed the various phases of the industry and gave many valu-

able suggestions on the care and management of the flock.

"STALLION ENROLMENT"

Prof. M. Cumming, and Live Stock Commissioner Bright spoke on the question of Stallion Enrolment. All stallion owners in the Province of Nova Scotia must enroll their stallions at the Truro Agricultural College where they will be classified in three divisions:—Pure breds, Grades and Cross breds or Mongrels. It is now proposed to introduce a stallion inspection act. This matter was unanimously approved by the farmers assembled at Sydney. For the first year or two inspection will be optional but eventually it will become compulsory. Stallion certificates of six kinds will be issued from the N. S. A. C.—Pure Bred Inspected, Pure Bred not Inspected, Grade Inspected, Grade not Inspected, Cross Bred Inspected, and Cross Bred not Inspected.

Commissioner Bright was very emphatic in his denounciation of the practice of allowing scrub sires to run at large and we would not be surprised if owners of such animals wake up some day in the near future and find that a law will be in force that will compel them to keep their scrubs where they belong. The time is near at hand, if we can judge aright, when owners of pure-bred females will not be pestered by stray, breachy scrub sires.

CREAM GATHERING CREAMERIES

W. A. McKay, Dairy Inspector, Truro, addressed the farmers on the dairy business in general and cream gathering creameries in particular. He outlined the methods employed by various styles of creamery managements and the advantages of the creamery over the home manufacture of butter. He also showed oow the creamery may become the centre around which farmers may rally in various lines of co-operative buying and selling. He instanced the work that is being accomplished at Yarmouth, Scotsburn and other dairy points throughout the province. The day of the cream gathering creameries in all dairy sections is fast approaching and in order to be ready for the efficient management of these creameries the Nova Scotia Agricultural College will ere long organize a special dairy school course where young men may qualify themselves for creamery managerships.

ON WEDNESDAY EVENING

S. J. Moore, of the Seed Division, delivered an instructive address on Field Crop Competitions and Seed Selection. He gave a resume of the Seed Control Act and gave definitions of what constitutes good seed. He showed the importance to farmers of growing their own seeds and following a system of selection such as is outlined by the Canadian Seed Growers' Association.

Mr. Moore's address was followed by solos rendered by Miss Greta Richardson, Mr. Musgrove and Miss Reid, of Sydney, which delighted the audience.

Prof. W. S. Blair followed with an address on The Home Vegetable Garden, extracts from which will be published in a future issue of the Farmer.

Prof. L. Stevenson, of the N. S. A. C., gave an interesting talk on Live Stock which was illustrated by lantern slides and keenly followed by the audience. He concluded his address by warning stock breeders against the terrible scourge of bovine tuberculosis

Following are the Resolutions passed at the meeting:—

RESOLUTIONS.

Whereas, the N. S. Provincial grant for the encouragement of Agriculture is to be supplemented by a substantial amount from the Federal Treasury, the same to be extended over a period of ten years and

Whereas, we approve of the present policy re. Provincial and County Exhibitions and

Whereas, there appears to be a need which would be supplied by grouping counties for the purpose of holding district exhibitions.

Therefore resolved, that the N. S. Farmers' Association respectfully urge that the Government of N. S. appropriate the sum of ten thousand dollars for the purpose of establishing five district exhibitions—one at Sydney for Island of C. B.—one at Bridgewater for Lunenburg, Queens and southern portion of Annapolis County,—one at Yarmouth for Shelbourne, Yarmouth and Digby Counties—one in central N. S. and one at Pictou for Pictou, Antigonish and Guysboro counties.

And further resolved, that the society holding a district exhibition be required to equalize transportation expenses of exhibits within the district, beyond a radius of fifteen miles.

Moved by Howard W. Corning.
Seconded by R. J. Messenger.

* * * *

Whereas, the Province of Nova Scotia is to receive a substantial grant from the Federal Treasury for Agricultural Educational purposes and

Whereas, the accomodations at Truro are reported to be inadequate for holding only one short course for the province,

Therefore resolved, that this Nova Scotia Farmers' Association recommends that the Department of Agriculture take steps to provide for holding short courses in five districts in the province viz:—one at Sydney, for the Island of Cape Breton; one at Bridgewater, for Lunenburg, Queens and the southern portion of Annapolis Co.; one at Yarmouth, for Shelbourne, Yarmouth and Digby Counties; one in the Annapolis Valley and one in eastern Nova Scotia.

Moved by Rev. Gordon T. Lewis,
Seconded by S. A. Cook.

* * * *

Whereas, the funds at present available for County Farmers' Associations are inadequate for carrying on institute work successfully and

Whereas, extensive districts are demanding the benefits of Agricultural meetings in their sections and

Whereas, substantial aid is to be given to the province of Nova Scotia from the Federal Treasury for Agricultural Educational purposes.

Therefore resolved, that the sum of one hundred and fifty dollars be given to each County Association in the Province to be expended under the direction of F. L. Fuller, Superintendent of Agricultural Associations and two men to be elected by ballot at the Annual meeting, for each County Association.

Moved by S. P. Gouday,
Seconded by R. Messenger.

* * * *

Whereas, there is need of much more pure bred stock for breeding purposes of all kinds in Nova Scotia and

Whereas, the individual buyer is greatly hampered in buying such stock because of the cost of transportation.

Therefore resolved, that we petition the Department of Agriculture of the Government of Nova Scotia to pay 50 per cent. of the cost of transportation of all such stock imported into the province by residents of the province.

Moved by Hugh Dickson and
Seconded by E. J. Johnson.

* * * *

Wheseas, sheep raising in Nova Scotia has been declining and whereas it is most important that the industry should be revived and

Whereas, one of the most serious causes of decline in the industry is the line fence and

Whereas, the present law in regard to line fences merely specifies that such fences "be at least four feet and a half high, except stone walls and picket, board and wire fences which shall be at least four feet high" (Chap. 93 Section 2 revised statutes 1900 Section 3 and 4) and states nothing in regard to such fences being of such construction as to turn sheep.

Therefore resolved, that the Nova Scotia Farmers' Association assembled at Sydney, Jan. 22, 1913 urge the Government to amend this statute so as to make a legal line fence, when so required by either of the parties concerned, to be one that will turn sheep.

Moved by H. C. McNeil
Seconded by C. Denton.

* * * *

Whereas, under present Legislation the Maritime Telegraph and Telephone Co., Ltd., has a monoply of the telephone service in Nova Scotia and

Whereas, we believe that the said Company is largely composed of stock for which no equivalent has been given and

Whereas, the services of the said Company as enacted is an imposition upon the farming population, making it possible for said campany to earn an enormous per centage annually on its original capitalization.

Therefore resolved, that we the Nova Scotia Farmers' Association assembled in Annual session at Sydney, January 22, 1913, would respectfully petition that your Honorable body would investigate the working and financial standing of the said Company and instruct your Public Utilities Commissioner to demand such rates as shall bear equitably upon the farming population of this Province.

Committee—Chas. R. B. Bryan, C. P. Blanchard, S. Spurr.

* * * *

Whereas, the purchase of a traction ditching outfit seems a heavy expense for a county or company even without duty and with the aid of the present Government bonus of $500 to the purchase of the first outfit in each county.

Therefore resolved, that in addition to the present bonus of $500.00 the government give aid to the extent of five cents per rod of ditch dug by such outfit.

R. J. Messenger
C. R. B. Bryan

* * * *

Whereas, the Government of Nova Scotia has passed an act called the Stallion Enrollment Act, which requires compulsary enrollment and,

Whereas, we believe the said act could be made more effective if the stallions were inspected,

Therefore resolved, that we ask the Government to amend the said act so as to make provision for optional inspection.

Wm. Murray,
Wm. O'Brien.

* * * *

Whereas, it is a lamentable fact that the sheep industry has suffered to an alarming extent because of the depredations of dogs,

Therefore resolved, that this meeting of farmers put themselves on record as being in favor of a statute placing a eax on dogs, such tax to form a fund which shall be used by municipalities to reimburse any losses from this cause.

Moved by C. P. Blanchard.
Seconded by C. H. Denton.

PROPER AIM IN BREEDING

Breeders seem to be satisfied with producing animals of individual merit; they seem to reach their goal with an individual that answers to the requirements of the score card. But to secure individual merit in breeding is a comparatively unimportant matter as compared with the chief aim, which should be in the mind of every breeder. It is not enough to produce animals with striking individual merit, to breed occasionally an animal that answers to the requirements of the score card. The thing mostly desired is the capacity uniformly to beget animals of high individual merit. The capacity for meritorious production is worth infinitely more than individual merit.

The breeders of dairy cattle have begun to recognize this fact and have developed certain families of uniformly high capacity for milk production. Members of these families command the highest price in the market. It would be absurd to award the highest premium to a dairy cow on the sole ground that she conformed to the requirements of the score card, without any regard to her capacity for milk production. The highest awards should go to the greatest uniform producers without regard to their conformity to score card standards.

It is freely admitted that a high rate of production is usually found in animals that most nearly conform to the requirements of the score card, but this is not always the case. Sometimes the animal that is marked lowest when judged by the score card is entitled to first place when judged by the quality and amount of production. The score card is valuable merely as a means to an end. Producers should put it where it logically belongs, in a secondary place, and award high honors to the capacity for production, which the score card does not always indicate. It is time to begin to award honors to what attains to the supreme end of breeding rather than to what is merely indicatory of it.

What has been said with reference to dairy cattle applies with equal force to the breeding of horses, beef cattle, sheep and hogs. The capacity to produce get of uniformly high individual merit should always receive the highest awards. A good animal of high individual merit is valuable, but if in addition to its high individual merit it has the capacity uniformly to produce animals of equal or greater merit its value becomes multiplied manyfold.

Stock shows will never accomplish the end for which they are designed until the highest honors they bestow are awarded to the sire and dam showing the best of 1, 2, and 3 years of age. Such a principle as this adopted as a basis of awards would lead all exhibitors to try to achieve the supreme end of all breeding by producing families of merit instead if individuals of merit. What the world needs is not so much better individuals as animals with the capacity to produce better individuals. Let awards be so made as to lead to the accomplishment of the supreme end of all breeding, to the satisfying of the great need of the world.

THE SCRUB BULL NUISANCE

One of the most important decisions of breeders of registered cattle, given in the court of justice, was the finding of the jury in the case of Vode vs. Vogan in the Court at L'Original, on Dec. 12th. An action was taken by G. D. Mode of Vankleek Hill, Ont., against his neighbor Vogan, who allowed his grade bull to trespass on Mode's property on May 7th last. When there the bull served the Ayrshire cow Eileen, noted for her large production of milk and fat, she having given in two years 24,581.4 lbs. milk and 1,158.42 lbs. of butter fat. Her best yearjs record was 13,825.7 lbs. of milk and 635.48 lbs. butter fat. Her average test was 4.59 per cent. fat. Eileen holds the second highest Canadian Ayrshire record for milk and first place for butter fat.

Shortly before Eileen was served by this bull her owner was offered the handsome sum of $1,000 for her, which offer he refused. Mr. Mode had been offered big money for her progeny as well, largely on the strength of her record, but as he was desirous of building up a herd noted for production he refused to sell Eileen or her progeny.

The bull entered on Mode's property through Vogan's fence which was in a bad state of repair. After the cow was bred Vogan did not appear to consider the cow damaged to any extent and would not make a settlement. Mr. Mode then entered an action to recover damages to the extent of $500.

Two days were taken up with trial which took place at L'Original before Judge Johnston. A large number of witnesses were called for either side. R. R. Ness of Howick, and W. F. Stephen of Huntingdon, were Mode's most important witnesses on the value of cow and progeny. Mr. Maxwell, counsel for the defence, put up a strong fight, and in doing so belittled the Ayrshire breeds and their records. He endeavored to prove that the calf from Eileen, mated with a grade bull, but of as great value as one from a registered Ayrshire sire. He further tried to show that the values shown by Ness and Stephen were fictitious. Mr. Hall, for the plaintiff, brought out some good points and was ably assisted by R. S. Pringle, K. C., of Ottawa, who acted as counsel. Pringle in his summing up the case before the jury made some strong points and showed by records and statements of the press, that the Ayrshire breed held a high position in the dairy world. He made a strong case and considered the principle involved was most important to breeders of registered stock. Also that records added much to the value of a registered cow.

The jury after being out an hour brought in a verdict of damages to the plaintiff of $50. This with the costs will amount to over $400. As far as we can learn this is the first case of this nature that has come before Canadian courts.

KEEPING THE BOYS HOME

A. B. Wilmot, of the Immigration Department, gives an interesting illustration of how the ready made farm scheme in New Brunswick may be utilized to induce young men to stay at home rather than leave the Province. A Gloucester County farmer had four sons, who had about made up their minds to go away. They were induced to take four farms adjoining each other, and the initial payment was made in accordance with the Act, and these young men will remain in the province. They have ten years in which to pay for the farms. Quite a number of farms have been taken up since the Act went into operation, and there are many inquiries from abroad concerning the terms under which these farms may be secured.

GOOD ROADS

The benefit of Good Highways to the citizens of any community is very well shown in the following extract from the address of Mr. J. A. MacPherson, Chairman of the Board of Highway Commissioners of Saskatchewan, given at the Convention of the Canadian Highway Association in Winnipeg.

"A farm adjoining a good road will sell for a higher price and is worth more than one on a poor road. There is a great advantage in having a farm within reasonable distance of a railway station. So much so is this the case that the matter of the distance from the railway has a very macerial effect on the price of land. Anything grown on a farm has little value unless it can be transported to a market, and many homesteaders look to the improvement of means of communication to give a value to their homes which they have not now. Anything that will facilitate the ready access to market from the farms cannot help but add to their value, and good roads are as essential a part of the machinery for doing successful business in the country as suitable houses, stables and other improvements which farmers recognize as being absolutely necessary."

"So much money is wasted in transportation over bad roads that it is cheaper to improve the roads than to leave them as they are, and money invested in roads will give a return of the greatest dividends."

"In many sections at certain times of the year the condition of the roads prohibits people from getting about and people lose their interest in current events, become dissatisfied and are not in a position to carry on their business with the enthusiasm which is so necessary to make a success of it. Bad roads reacting this way so as to affect all the departments of life and improving the roads indirectly raises the standard of living all along the line."

GET SEED SUPPLY EARLY

Last year hundreds of thousands of dollars were lost to the farmers of the Maritime Provinces through the ignorance, in part, and the avarice of the dealers through selling grain which was entirely unfit for seed purposes. Some of the farmers themselves were to blame by looking for cheap goods. Low vitality seed is expensive at any price. Profiting by the severe experiences of the past season we trust that not one of our readers will again be caught napping. If supplies of seed sufficient for this season's sowing and planting are not available from the home grown grain, take the precaution to get your supply early and from reliable sources, and go forward with a determination from henceforth to grow and select your own seed each year.

EDITORIAL NOTES

Says Sir Thomas Lipton: "Fall in love with your business. Keep away from drink, from theaters, from society, from everything that may distract you until you have made a firm footing, and—be nice to everyone without distinction. Don't take a partner and never accept a loan. Keep a straight name and be on good terms with your work-people. No business can succeed if the employees don't like it to. And advertise all the time. You can't have too much advertisement."

Woodrow Wilson says: "It is a happy circumstances that the pure air of the countryside is beginning to blow through our affairs, that by many means of quick and easy transpartation the farm is being made neighbor to the city, and that the calm thought of the unheeded fields, the thought of men in little hamlets and remote homesteads, is becoming part of the thought of the nation as it never was before. We shall be a happy people only when we are a united people, when class is not set against class, when no man seeks any privilege except the privilege of common service."

Nova Scotia Fruit Growers Celebrate Their Golden Jubilee

The fiftieth annual convention of the Nova Scotia Fruit Growers' Association convened in Assembly Hall, Middleton, N. S., on January 28th, 29th and 30th, 1913.

The hall was filled to the doors with enthusiastic fruit growers, men who realize that the Association has been able to accomplish for their industry during the half century of its existence.

PRESIDENT'S ADDRESS.

S. C. Parker, President of the Association occupied the chair and after the opening prayer read the following address.

Members of the Fruit Growers' Association, Ladies and Gentlemen:

It is customary for the President of this Association, at the opening session to make some remarks, termed by courtesy—The President's Address. For twenty-five years I have been somewhat intimately acquainted with the work of this Association; for more than twenty of these serving as your Secretary. During these years I have been in attendance at every annual meeting, and, poss at all other important meetings of the Association. I would, therefore, ask your indulgent hearing for a few moments, to some reminiscences of past history.

It seems to me that the Association can, with justice, congratulate itself on the progress of this organization and the great fruit industry which it represents. For the half century of its existence this Association has been in the front, organizing and developing the fruit interests of the Province, and to-day the record of the Fruit Growers' Association is the record of fruit growing in Nova Scotia. Twenty years ago the apple industry was in its infancy. We were exporting 50,000 to 100,000 barrels annually. The orchard was a side line of the general farmer. Clean cultivation and cover crops were a myth; spraying was practically unknown. Opportunity for education in fruit farming were entirely lacking. To-day we are facing a crop of two million barrels annually, and five millions in the near future. Indeed, Mr. W. H. Chase, perhaps the best commercial authority in the Province, predicts a crop of five million barrels in five years. Our growers, educated in best methods, equipped with up-to-date machinery, united and determined—realizing that with us it is apples or nothing, are pushing Annapolis Valley apples into all the markets of the world.

This Association is largely responsible for the remarkable advance in facilities for agricultural education. Nearly twenty years ago the Association founded a Horticultural School at Wolfville. This school, which was carried on with much success for twelve years, was organized and managed directly by this Association. The Association then entered on a campaign for further advancement, and after years of discouragement and apathy, succeeded in inducing the Provincial Government to found the Agricultural College located at Truro. This institution, under the vigorous direction of Professor Cumming, has become a mighty factor in the upbuilding of the basic industry of agriculture. During the past year the devoting of the Federal Government Grant to further enlarging and equipping the College, places it in the front rank of institutions of its kind. With the Agricultural College fairly launched, the Association took up the matter of practical work. For five years the campaign was waged with unceasing vigor. Success again crowned the effort and the Experimental Station at Kentville is also the direct result of the work of this Association. The vigor with which development work on the new Station is being pressed by the director, Professor Blair, presage great things for further advance in fruit growing. To those of us who served through this long and hard campaign, the name and figure of R. S. Eaton stands prominent. It is but scant justice to name Mr. Eaton as the always foremost leader in the struggle for advanced agricultural education.

The co-operative movement which is revolutionizing the commercial end of the fruit business is another child of the Association. During the past twenty years co-operation has been taught and promoted by the Association, as individuals and as an organization. In 1897, under the auspices of the Association, a co-operative company was incorporated with a capital of $50,000.00. As specified in the charter the objects of the company were: (1) to erect warehouses, (2) to provide transportation, (3) to regulate shipments; (4) to appoint agents in Great Britain and other markets for the sale of Nova Scotia apples. The men who were behind that movement, some of whom are here today, had the keen business foresight to see the necessity and provide an organization, practically the same as being worked out today by the United Fruit Companies.. Lack of co-operation prevented any sustained attempt at organization under the provisions of the Charter and nothing was accomplished. The people needed fifteen years more wandering in the wilderness and further chastenings by various plagues, to feel more keenly the importance of getting together and doing business. The organizers of the first local Co-operative Society were working members of the Association. The Act of incorporation under which all the local companies are working was prepared and passed through the Legislature by your own Executive. The officers and Executive of the Central Company are, many of them, old and tried members of this body. The Association to-day extends a hearty welcome to the representatives of the Co-operative Companies, and would assure them that we rejoice at the measure of success that is following them. We need you and you need us; let us stand together one and all, for advance work.

The officers of the Association have been strong men. My first recollection of its meetings, was with J. W. Bigelow in the chair. For twelve years Mr. Bigelow was a live wire President. He gave freely of his time, money, and trained business ability, in founding on a broad, substantial basis the future of the Association and the fruit industry of the Province. The commercial fruit business of Nova Scotia owes much to J. W. Bigelow. I would record here, also, the name of R. W. Starr, who gave me my first lessons in Associational work; and whose life and efforts for the past fifty years have been largely devoted to unselfish work in advancing and upbuilding the fruit interests of this Province. There were many others, some of whom are here to-day, and many not now enrolled with us, whose names are on "The Great Scroll up Yonder," but whose memory is fragrant.

So much for the past,—what of the future? We are at a crisis in the history of the Association—at the parting of the ways. It has been said we will be growing five million barrels in 1918. What will we do with them? Fruit growing has become fashionable. An enormous increase in apple production is coming, the world over. Ontario and New York are cleaning up their old orchards and planting new trees by the thousands.

Officers of the Nova Scotia Fruit Grower's Association for 1913.

Reading from Left to Right—S. H. Trenholm, Asst.-Secretary; A. E. McMahon, Director; M. K. Ellis, Secretary; Prof. M. Cumming, Prof. W. S. Blair, S. C. Parker, President; F. W. Bishop, Vice-president; A. C. Starr, S. B. Chute, F. H. Johnson, Directors.

British Columbia and the Pacific States are spending millions of dollars in developing and advertising great fruit ranches. New Brunswick and the New England States are preparing for a great increase in production. The export to British and foreign countries from all ports is about two and one-half million barrels annually. We can supply all that and then must seek new worlds to conquer. The fittest will survive! The Annapolis Valley is destined to supply the export apples of the world. We have cheap land, cheap labor, cheap transportation.

British Columbia is selling land at from one hundred to five hundred dollars per acre, no better than can be bought here at from ten to fifty dollars. Labor costs them fifty per cent. higher than our prices. Transportation to British markets costs them one dollar per box; it costs us one dollar per barrel. Nova Scotia apples this season have sold in every province of Canada, in Great Britain and Germany, in South Africa and the islands of the sea. Local markets, formerly undeveloped, under the working of the United Fruit Company are taking tens of thousands of barrels. To take advantage of our opportunities we must make a great advance in quality, we must grow better apples, the day of the No. 3 has passed. There is no royal road to success in fruit growing. I am painfully aware that the very honorable position of President of this Association affords no immunity from apple scab. Good apples mean eternal vigilance and intelligent work. The slogan for the coming years should be better apples rather than more apples. If we cannot grow clean apples we will be forced out of the market by our competitors. Intelligent spraying will give clean fruit. If anyone here is inclined to challenge this statement, let him look up and down the Annapolis Valley and he will find orchards, here and there in every section with clean apples, in a wilderness of scab. That intelligent thinning will improve the quality, both in size and appearance is abundantly proven; and men are here today with facts and figures that are incontrovertible. Intelligent handling is another requisite to better apples; there is too much careless handling in the orchard and in the warehouse. Fruit that costs the consumer from three to five cents per pound demands a kind of kid glove system of handling that is not yet developed in this country.

Intelligent marketing of the product is an essential to success. Fifteen thousand growers cannot, individually, handle their product with the same success that a Corporation can. Under co-operation the smallest grower is placed on the same terms, commercially, as the largest. We have the United Fruit Company, a machine, that with intelligent working will revolutionize the problem of greater markets.

You will allow me a personal word in closing. I would take this opportunity of thanking this Association for the confidence reposed in me during my long official connection with the organization. I have enjoyed the work, and done what I could for the upbuilding of the fruit industry. I wish also, and I think now I can speak for the Association as well, to thank the officials and staff of the Departments of Agriculture, both Federal and Provincial for their constant assistance and advice in all times of need. In this general statement, it is no invidious distinction to name Principal Cumming, Secretary for Agriculture for Nova Scotia, who is always ready for anything that promises advancement to the fruit interest.

The Fruit Growers' Association is a splendid body of men, whom it is an honor and a privilege to serve; and with whom I hope in a private capacity still to continue in the promotion of our common business.

DIRECTORS' REPORT ON YEAR'S WORK

1912 has undoubtedly been a live year in the annals of the Nova Scotia Fruit Growers' Association. The great crop of 1911 seemed to give everything connected with fruit growing an optimistic feeling, and this feeling has been well exemplified this past season in the forward movement of the "Brown Tail Moth," the "Black Spot" and the Co-operative Company's campaigns.

Strange indeed, if among such stirring times, our Association did not soon feel life moving in its ancient veins and realize that if it wished to stay in the van of progress, it was time to arouse itself.

An effort has been made during the year to enroll a large number of members with some measure of success, there being 108 annual subscribers. This number is still ridiculously small in comparison to the number in our province engaged in fruit grow-

ing. A live Association should have at least 500 members to make an aggressive working body.

A quarterly meeting was held on April 12th, at Kentville to receive the report of our delegates to the Fruit Conference at Ottawa, and to listen to an address on Co-operative Fruit Companies by John N. Chute, of Berwick. A full account of this meeting is found in our last annual report.

In May, Inspector Saunders reported the finding of live San Jose Scale on imported nursery stock, and at the request of Principal Cumming, a special meeting of our association was called on June 2nd to discuss the situation. The recommendations made at that meeting were immediately put in force by the provincial government and a thorough examination made as far as possible, of all imported nursery stock. This examination revealed a state of affairs, the seriousness of which can hardly be over-estimated. Live Scale was found in almost all parts of the Valley, on nursery stock from Ontario, of the past three years importations.

The inspectors, armed with the necessary authority destroyed over 600 young trees during the summer and have made as careful an examination as possible, but it is too much to expect, knowing the minuteness of the pest, and the wide area over which it has spread , that all danger has passed.

We believe that it is the intention of the Provincial Government to push its campaign against the Scale with even greater energy during the coming season, and we can only hope and pray that their efforts will be crowned with success, for it is our opinion, in the light of the experiences of other fruit districts, that if this pest ever becomes established in Nova Scotia, one of the greatest blows possible will be dealt our horticultural interests.

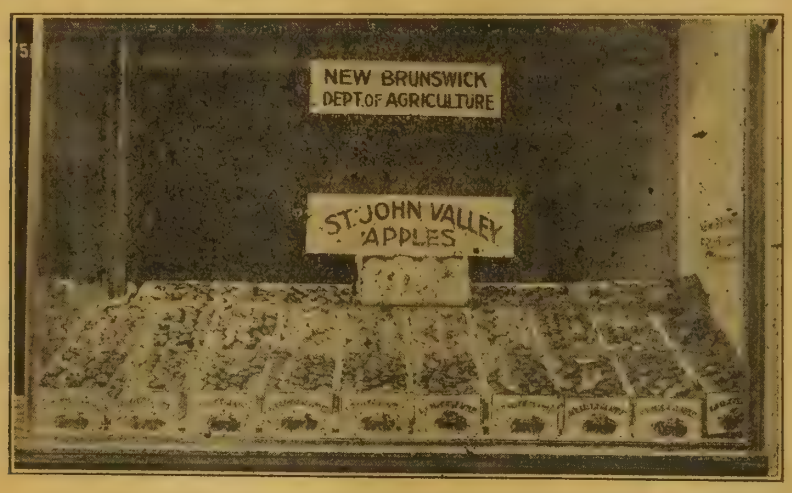
The fruit sections of Nova Scotia produced a bumper crop of plums and pears this past season, but prices were very low. Strawberries were only half a crop but apples, while not up to the record breaking point of 1911 still exceeded any other previous year. With much rain all through the growing season and general neglect of the spray pump we had conditions most favorable for fungus growth, and as a consequence great loss was caused to the whole community by the rvages of black spot.

That our industry cannot grow in proportion to our great natural advantages is evident in the light of last season's experiences unless our orchards are conducted on better business principles, and spraying for fungus control carried on every season as an assurance against black spot. Literally hundreds of thousands of dollars have been lost this past year on account of this neglect, and while the lesson is a costly one, it will not be a bit too severe if by it we learn that spraying must be accepted as a part of orchard practice that cannot be neglected. With this lesson of 1912 in mind your directors have secured at considerable expense Prof. J. P. Stewart, of the Penn. State Experimental Station to address the Association on the latest discoveries of science on how to control fungus diseases. Prof. Stewart's reputation speaks for itself, and armed with the knowledge he can give us, we should be able to combat our enemies in this line better in the future.

In August our association was honored by a visit from the minister of Agriculture, the Hon. Martin Burrill. He was taken with Mrs. Burrill for a twenty-five mile ride through some of our best fruit districts, and in the evening he addressed our members in the Court House at Kentville. At that meeting a petition was read asking the Minister to lease for spraying and other experimental purposes four full grown orchards each 5 acres in extent in different parts of the Valley to be conducted in connection with the Experimental Station at Kentville, on which there was no orchard now available. The Minister promised to give this request his consideration, and at a later date the Secretary received a letter from the member for Kings, Mr. Foster, stating that the Department of Agriculture had agreed to lease three orchards, one situated in each of the three counties of Hants, Kings and Annapolis for the purpose asked for by the Association.

During August one orchard meeting was held under the auspices of our Association at the farm of Isaac Chipman, near Kentville. This meeting was very largely attended and after observing the beneficial results of careful spraying, the members listened to impromptu addresses in the open air by Principal Cumming, Prof. Blair, Prof. Shaw and Mr. W. H. Woodworth.

A general meeting of fruit growers was called in October by the Secretary for Agriculture, on behalf of the Government to learn the wishes of the fruit growers in regard to regulations dealing with the importation of nursery stock. This meeting was very largely attended by representatives of all the fruit growers and fruit companies in the Valley as well as by several members of the Government. The opinion of the meeting as expressed in a resolution was immediately put in force by orders in council, and required that all nursery stock from districts known to be infested with San Jose Scale, imported into Nova Scotia shall have attached to it a certificate stating that the nursery had been examined by a government inspector between May 15th and September 15th of the previous



The New Brunswick Department of Agriculture Apple Exhibit in Montreal.

This is only one of the methods whereby the Department is popularizing New Brunswick grown fruit.

Shop by Mail at Scroggie's

We prepay transportation charges on all orders of $5 and over in Quebec, Maritime Provinces and Ontario except north and west of Sudbury and Sault Ste. Marie.

A-Z-1—Fine Lawn Waist, Women's Waists, attractive, semi-tailored, style very popular just now; made of finest quality sheer white lawn; front has dainty embroidery and fastens with pretty round pearl buttons, front and back; has rows of tucking, linen collar and cuffs. Sizes 32 to 44. Our Low Price **98c**

A-Z-17

WOMEN'S RAINCOATS

Special—A handsome new style coat, and one of the best values we have seen this season, made of good quality Paramatta cloth. Colors: Fawn and tan. Close-fitting collar. Loose - fitting back. Sizes: 32 to 42. Our Low Price

$4.98

A-Z-5

Exceptional Value in Men's Suits at $9.95

Suits that are very dressy, and will give excellent wear and satisfaction. They are made from fine English Tweeds in the fashionable brown and grey mixture, showing faint thread shapes, cut in the latest single-breasted sack style, with nicely shaped shoulders and lapels, tailored and finished in the very best possible manner; sizes, 34 to 42. Special value—

$9.95

A-Z-3. — Women's Skirts — Made of good quality Panama cloth. Colors or navy, attractive style. Waist band 23 to 29. Length, 36 to 43. Price.. **$2.98**

A-Z-4.—Near Silk Petticoat—Splendid new style, made of fine quality near silk, shirred flounce, edged with pleating, colors, black, navy, brown and green. Our low price.. **$1.25**

A-Z-8
A BAG SPECIAL

A special purchase of 500 only of real leather hand bags in seal grain effect, having a nine-inch frame, silver plated, nicely leather lined, small inside purse and flexible handle, wonderful value **$1.00**
Only 500 in lot. Order early.

A-Z-9 **Easter Footwear at Exceptionally Low Prices when Quality is Considered.**

Ladies' Boots, made on the newest American lasts; style and fit perfect; in tan, calf, gun metal, patent colt, with plain toe and cravenette top, button and lace; styles Cuban heels; sizes 2½ to 7. Special .

$2.98

A-Z-6 —Scroggie's Famous Glove Values the Wonder. Ladies' washable chamoisette Gloves, 2 dome, in white and natural shades; sizes 5½ to 7½, for, per pair **25c**

A-Z-7— Scroggie's Famous Gloves for Easter, greatest value in Canada. Ladies' fine quality Kid Gloves, beautiful soft skins, with two handsome domes, and neatly stitched backs; good value for 79c. Special Easter Offer at **59c**
All sizes; colors, tan, brown, white, black, etc.

Our New Spring Style Book will be ready for mailing soon. Copies will be sent free on request. Write for one. It's the greatest ever published.

SPRAYERS

for large or small orchards, market gardens, potato farms, grain, mustard, tobacco, home and garden work, poultry plants, whitewashing, cleaning, cold water painting, etc. From *Bucket, Knapsack* and *Barrel Sprayers*, to *Traction* and 50, 100, 150 and 250 gallon *Power Sprayers*—complete or in part to build up Sprayers already in use. Combinations

$4 to $400
(Now made in Canada)

They have outside pumps, no corrosion. Unit sprayers, so you can build bigger when necessary. Ask your dealer to show them and write for new booklet, "*Spraying Vines, Trees* and *Bushes*." We also make full line potato machines, garden tools, etc.

IRON AGE

The Bateman-Wilkinson Co Limited
434 Symington Ave., Toronto, Ontario

Do you know that more real danger lurks in a common cold than in any other of the minor ailments? The safe way is to take Chamberlain's Cough Remedy, a thoroughly reliable preparation, and rid yourself of the cold as quickly as possible. This remedy is for sale by all dealers.

year, and found apparently free from scale, and as a further precaution, all such nursery stock was required to enter the province through either Truro or Middleton where it will undergo further examination and fumigation.

No one can doubt but what our industry, in spite of many drawbacks is making rapid progress, and in this, one of the greatest factors is the work of the co-operative companies. Their growth has been truly phenomenal. The first company starting some five years ago with twelve members has now increased to thirty-five companies with over 1500 members, and an organization that already dominates the marketing end of our business to the advantage both of consumer and producer.

Only one other farmers' organization in Canada, the Grain Growers' Grain Co., of Winnipeg, can compare with our Fruit Companies in its rapid growth from small beginning, and as the Grain Growers' Company would never have been formed had it not been for the lessons taught and principles established by the early Grain Growers' Association so we can properly claim the co-operation fruit business as a child of this Association and see expressed in them the natural result of the work and educative influence of those noble men who founded and worked for the Nova Scotia Fruit Growers' Association during the fifty years of its existence.

Recognizing that our Association can both help and be helped by these more practical fruit companies your directors have invited each co-operative company to send three delegates to represent them at this meeting. From this source we hope to gain new strength that we may be able to grapple with the new responsibilities each year brings for us.

There has been brought forcibly to our attention during the past year the importance of securing a large grant from the Provincial Government, if our Association is to make the progress it should to keep abreast of the times. Quebec, with a tenth of our horticultural interests allows its Fruit Growers Association a grant of $500.00 and prints the Annual Report. This matter will be taken up later in the meeting in the form of a resolution which I hope will merit your support.—Manning K. Ells, for the Directors.

After the reading of the Presidential address and Directors' Reports Messrs. R. S. Eaton, R. J. Messenger and Capt. C. O. Allen were appointed a committee on addresses and resolutions.

THE SAN JOSE SCALE SITUATION IN NOVA SCOTIA.

was then ably presented by Dr. Robert Matherson, of the N. S. A. C., who gave a full history of the life cycle of the Scale, its injury to trees, its introduction into the United States and subsequently into Canaha and on to Nova Scotia. The method whereby infection is spread from one district to another is usually on nursery stock. Although nursery stock coming into Nova Scotia is supposed to be fumigated the operation had been carelessly attended to in some instances and consequently some live scale had been introduced from infested Ontario areas during the past few years. The pest, was first discovered in Nova Scotia by Mr. Saunders, of the Department for Agriculture.

He also outlined the plan of campaign inagurated by Dr. Hewett and Prof. Cumming re discovering the extent of the scale infestation in Nova Scotia. A list of nursery stock imported into the province during the past three years had been procured and the plantings had been inspected and where living scale were in evi-

DAIRYING.

Co-Operation Between Factoryman and Patron.

Agriculture and its products, such as dairy produce, is the most important division of Canadian Commerce, and organization is the unit of commercial success. Therefore, we must have organization in development of our agricultural commerce. Organization has developed so rapidly and naturally in other trades, or industries, that they are now in highly organized condition, but agriculture has remained unorganized until very recently because its capital is divided among and controlled by a large number of capitalists. In other industries the capital is owned and controlled by few capitalists.

Another reason is because the farmer lives and works outside the commercial cities and this has given rise to the middleman who can cater to the wants of the consumer to better advantage than the farmers, they being isolated from one another as well as from the consumer. Without organization, the farmers do not know one another well enough to intelligently direct their production. Thus the middleman, by knowing the wants of his customers and where the article is produced, can go directly and procure it, the farmer being glad to sell, or he can take his various products grade and classify them and ship them to a ready market. Therefore, the middleman is a benefactor and is here as a necessary evil but his proper place is that of an agent rather than that of a director or master. He has helped to organize agriculture to a certain extent by working to secure the results of organization for his own benefit and to his own advantage, but this presently leads to the control of the production and the farmer gradually loses his independence and becomes a mere tool in the hands of the middleman.

Why cannot the farmers have their own organizations and thereby secure the advantages of organization for the farmer and shortly become master of the situation by drawing the farmers closer together under a common bond of community interest also placing him on a financial basis with his city brother. Lastly but not least, by having their own middlemen, directly controlled by and responsible to the farmer.

Many forms of organization have been tried, such as joint stock farming, which has failed to produce the desired effects, and the combine which has met without success. Out of the many forms which have been tried there is but one which has passed through the successive stages of experiment and proved its adaptibility to many countries, such as Germany, Denmark, France, England and Canada, and this form is direct co-operation between farmers.

To explain the co-operative idea, I will quote from C. R. Fay's "Co-operation at Home and Abroad," in which he defines co-operative society as "an association for the purpose of joint trading originated among the weak and conducted always in an unselfish spirit on such terms that all who are prepared to assume the duties of members may share in its rewards, in proportion to the degree in which they make use of their association." Is this form not feasable in working out our farm organization? It has proven satisfactory in many places, why have we not proceeded with it? Is it because, as some might say, we are pig headed, disloyal or distrustful? No, I think not. It has been for other reasons.

There have been so many resources and openings that we have not been driven to co-operation but that the day is near when we shall be obliged to co-operate to a greater extent. Another, and the greatest reason, I believe, is the lack of education. Why should we not direct our attention to this cause and remedy it as quickly as possible.

In discussing this sunject of co-operation between factorymen and patrons, I shall take up in brief the factory which I am representing, namely the Cumberland Co-operative Creamery Co., Ltd., which is purely co-operative, owned and operated by the patrons and can be used to their best interests as they see fit. In this case there is no factorymen or middleman except the maker, who is hired by the patrons and is at their disposal.

Considering the fact that most of our factories are not purely co-operative, I shall discuss some points in which factorymen and patrons can help one another.

There can be little doubt that there is a lack of understanding between the factory man and the patron which could be largely overcome to the advantage of both parties through better co-operation. The patron takes little interest in the maker except to see that he does not give him a few pounds less on his milk in the morning. While, on the other hand, the maker looks on the farmer as a man who brings so much milk or cream and who ought to bring him a little more of better quality. How are we going to get this large supply of better quality? By more co-operation between the two, especially on the part of the maker or factory man as he has to educate the farmer.

The butter-maker must be a man among men; he must have training, knowledge and experience before he can manage a creamery or factory. The maker's efficiency is gauged by his ability to make good butter, his tact in handling cream haulers and patrons, as well as his ability to transact ordinary business affairs.

The maker has the better opportunity because he comes in personal contact with practically every man and those he does not meet, he sends reports to, and he can make suggestions intelligently because he should have the knowledge and in this way he can help to educate the farmer. There are few farmers who would not try to do better if they had the knowledge, so it is up to the factoryman to spread the good news as far as possible and get more business to pay for it.

There are different ways in which knowledge can be spread from the factory to the farmer and the factory man should be only too glad to do it. It can be done by sending out pamphlets of literature along dairy lines, such as care of cream, cow feeding, etc., also by dairy meetings where talks are given on certain subjects and also by demonstration. If a farmer fails to improve his quality when it gets out of order, go to his place and try to find out the cause of the bad flavor or whatever it is, point it out to him in a reasonable way and, if it is carelessness and he refuses to remedy it, you will have to drop him. He will soon see his mistake.

Let me suggest that you take a little more interest in the returns of every man who is shipping to you; show some interest in them for that is a wonderful help to the farmer. A good maker can work wonders by speaking encouragingly to the farmer. Let him compare his results with some of his neighbors in a respectable, unprejudiced way. It is not so much the man who is sending in the large amount that you want to keep

International Stock Food

79

DON'T let your horses run down during the winter and get so soft that they will lose flesh badly when you start your spring plowing. If horses are not worked regularly during the winter, they need the splendid tonic effects of INTERNATIONAL STOCK FOOD, to tone up the digestive organs, enable them to get all the good out of their feed, prevent the blood from becoming overheated, and thus ward off disease.

LANGHAM, SASK., Jan. 26th. 1912.

"I have fed INTERNATIONAL STOCK FOOD for many years. I always have a 25 pound pail standing in my barn. I bought a pair of three year old colts and they were so worked down that my neighbors said I had been beat. When I bought the colts, they weighed 2400 lbs. I ploughed 25 acres and they weighed 2650—then I harvested 163 acres and threshed and hauled one carload to town, 6 miles, I weighed them again and they weighed 2850, and I said "They shall weigh 3000 before spring". Now, the Neighbors want to buy them but there's no chance". J. G. REMPEL.

THE ST. JOHN BUSINESS COLLEGE

S. KERR Principal.

at, it is the small producer who could produce a lot more, although a few words to the big fellow will not come amiss. If you can gain the good will of the farmer and get interested in him, you will be doubly paid in the long run.

Do some testing for him, get him interested in cow testing associations, records, use of the scales in the dairy stable as well as in the factory. This is not all for the sake of the farmer but it is also for your own sake and I believe you will not be doing any more than your duty.

Are there not times when the factory man could handle feed, seed or fertilizer at a small margin to the advantage of both? They can also act in some cases as collectors of farm produce, such as potatoes, and put them on the wholesale market.

Learned professors, Ministers of State, economists, parsons and men of business, all who have had an opportunity of judging by their own eyes join in the chorus of laudation.

Foreign governments are steadily encouraging institutions of co-operative enterprize.—R. L. Rutherford, B. S. A., River Hebert, N. S. at the recent Dairymens' Convention, Truro, N. S.

Short Courses in Fruit Growing

N. B. Provincial Department of Agriculture has arranged to hold a series of short courses in fruit growing, each of two days duration, as follows:—February 3rd and 4th, at Keswick Ridge; February 6th and 7th, at Fredericton; February 10th and 11th, at Burton; February 13th and 14th, at Gagetown; February 24th and 25th at Central Hampstead; February 27th and 28th, at Brown's Flats and March 4th and 5th at Moncton. Short courses may also be held at one or two other places, if demanded. The following programme will be closely adhered to:

FIRST DAY.

9. a. m.—The Outlook for Fruit Growing, A. G. Turney.

9.30 a. m.—Address on Box Packing of Apples, R. P. Gorham.

16 a. m. to 12 a. m.—Practical Work in Box Packing.

2 p. m. to 5 p. m.—Practical Work in Box Packing.

8 p. m.—The Fruit Marks Act, S. L. Peters.

8.45 p. m.—Insect and Fungus Pests of the Orchard and How to Control Them, R. P. Gorham.

9.15 p. m.—The Selection of Nursery Stock and Planting of Orchards, A. G. Turney.

SECOND DAY.

9 a. m.—Demonstration of Barrel Packing of Apples, S. L. Peters.

15 a. m. to 12 a. m.—Practical Work in Box and Barrel Packing.

2 p. m. to 5 p. m.—Practical Work in Pruning in Orchard (weather permitting) or Box Packing.

8 p. m. to 10 p. m.—Question Drawer and Discussion of Subjects as Desired by the Class.

Alterations in this programme will be made to permit the discussion and treatment of other phases of fruit growing should the class so desire.

These courses will be in charge of Mr. A. G. Turney, Horticulturist, assisted by Mr. R. P. Gorham, Assistant Horticulturist, and Mr. S. L. Peters, Dominion Fruit Inspector. Every effort will be made to render these courses as practical as possible and a large portion of the time will be devoted to pratical work in box and barrel packing and pruning. It is to be hoped that the fruit growers in the districts where these courses are to be held will show their appreciation of this interest in their behalf by attending in good numbers and co-operating with the instructors in maving the movement successful.

8500 Revolutions Per Minute

THAT is the wonderful speed at which an I H C separator bowl turns. The rim of a six-inch bowl, running at separating speed, is traveling at the rate of nearly two and a half miles a minute, faster than the swiftest express train that ever ran. Such speed as this means strain on shafts, bearings, gears, frame, in every part of a separator, such strain as can only be rendered harmless by the nicest adjustment of strength, flexibility, and quality of material and workmanship. The business of a cream separator is to skim the butter-fat from whole milk, but to do this it must be made mechanically right, or it soon ceases to be useful as a separator. The machine that meets these conditions and sells at the right price is an

I H C Cream Separator Bluebell or Dairymaid

I H C separators have that carefulness of adjustment and balancing of moving parts which make for durability and easy running.

There are points in the construction of I H C separators, such as the heavy phosphor bronze bushings, trouble-proof neck bearing, cut-away wings, dirt and milk-proof spiral gears, etc., which make I H C separators, beyond any doubt, the best of all to buy. There are four convenient sizes of each style. Ask the I H C local agent for demonstration. Get catalogues and full information from him or write the nearest branch house.

Waterloo Boy Cream Separators Are Good Separators

and you need one if you have the milk of even a single cow. You are wasting quantity and quality of product every day you go without one.

This waste is greatest in cold weather and it counts most of course when butter is high. Then with a separator there is always the warm, sweet skim milk and saving of time and labor in addition.

When it comes to a choice of separator Waterloo Boy superiority is now universally recognized. Those who "know" replace the other separator with a Waterloo Boy later, thousands of users are doing that this year. If you already have some other machine the sooner you exchange it for a Waterloo Boy the better. See and try a Waterloo now while you have plenty of time.

Nova Scotia Fruit Growers Celebrate Their Golden Jubilee.

(Continued from page 303)

dence the trees were destroyed—no fewer than 723 trees have already been destroyed.

Dr. Matherson also gave the full list of nursery firms from which destroyed trees had been imported and the number of destroyed trees which came from the respective nurseries during the seasons of 1910, 1911 and 1912.

The resolution passed last summer by the Nova Scotia fruit growers in special session at Kentville and finally made a Provincial Act by order in Council, enacting that all nursery stock imported into Nova Scotia must be brought into the province through the entry ports of Truro and Middleton where trees must be thoroughly fumigated and which prohibited the importation of stock, from nurseries not showing a certificate of a clean bill of health, signed by a Dominion nursery inspector between the dates of May 15th and September 15th preceding, was a thorn in the flesh of the Upper Canada nurserymen, who are leaving no stone unturned to secure some leniency so that they may ship fruit trees to Nova Scotia this year. The Nova Scotia Fruit Growers do not want any more Scale than they have at present and backed up the Department for Agriculture and the Act by unanimously passing a strong resolution asking that the Act be enforced to the letter.

Dr. Matheson concluded his address by asking the fruit growers to do their duty in assisting the department to locate infested trees and combat the pest by carefully spraying trees with lime-sulphur at the right season.

SOME IMPORTANT POINTS IN BOX PACKING.

Prof. W. Saxby Blair of the Dominion Experimental Station, Kentville, gave a talk on "Important Points in Box Packing." The dimensions of box and box material were enumerated and reasons given why certain thicknesses and sizes were adopted.

Fruit for box packing must be of uniform growth and color and must be strictly graded. Fruit should be sorted according to size before it was passed on to the box packer. Wrapped fruit gives a neater appearing pack and will keep better as they are not so subject to change of temperature and they can be packed tighter without injury.

The only way to master box packing is to go at it and master the art by practice. Packing is a man's job—a job for a man who could command good wages and work as rapidly as carefulness will warrant.

The style of pack must be governed by size of apples. The diagonal pack had some advantages over the square pack but the chief essential was to get a tight pack. The number of apples contained in a box should be marked on the box.

THE QUESTION OF MARKETING APPLES IN BOXES.

was discussed by R. S. Eaton, president of the Hillcrest Orchards. In his opening remarks Mr. Eaton said that he felt proud that Prof. Blair, a Nova Scotian had come back to advance fruit growing interests in Nova Scotia. It was particularly gratifying to him, as it must be to all fruit growers, that so many of Nova Scotia's educational institutions were being manned by Nova Scotians, who had so ably qualified themselves for their respective positions.

He congratulated Prof. Blair on the showing of fruit, he had at the meeting, packed on the Experimental Station, Kentville.

Mr. Eaton said that providing the orchardist was properly equipped, and his consignees require boxed fruit it was to the fruit grower's advantage to pack his choice and fancy No. 1's in boxes. Box packing requires careful supervision and very soon it becomes a mechanical operation. Much time could be gained by having boxes prepared before the rush season came on. He exemplified the proper method for creasing lining paper for boxes so that it would not be torn on the edges when the top and bottom of box were sprung into position. He also explained how printed labels should be put on to give a neat appearance.

ON TUESDAY EVENING.

Mayor Goucher of the Orchard Town, Middleton, in behalf of the citizens extended a hearty welcome to the fruit growers. Dr. Sponagle, represented the Middleton Board of Trade. Mr. Shaw, of Berwick, made a fitting reply in behalf of the fruit growers.

ORCHARD FERTILIZERS

Prof. J. P. Stewart, Penn. State College, addressed the meeting on the subject of Orchard Fertilizers.

Before tackling his subject Prof. Stewart scored the multiplicity of middlemen as one of the chief causes why growers do not get higher prices for their fruit. Improper distribution and congested markets was another cause. The middleman could easily be eliminated through the adoption of co-operative selling systems and to avoid congested markets it was necessary that only the very best fruit be shipped. In reply to the question, what will we do with our 2's and 3's? Prof. Stewart replied "Don't grow them" and went on to show how by proper systems of cultivation, fertilization, pruning, thinning and spraying it was possible to grow a high percentage of No. 1's and reduce the growth of No. 2's and 3's to a minimum. His address will appear in a future issue. It was based throughout on the dollars and cents that accrue to the fruit grower as a profit on his investment. Every orchardist must ask his trees certain questions and on their reply must hinge the kind of treatment received by them for better results.

THE FINANCIAL STATEMENT

was the first number on the program, Wednesday morning. It showed receipts including last year's balance ($306.16) of $800.11. Expenditures—$546.80 leaving a cash balance on hand, Jan. 14th, 1913 of $253.31 which was vouched for as correct by J. Elliott Smith and W. M. Black, auditors for the Association.

THE ELECTION OF OFFICERS

resulted as follows:—

President—S. C. Parker, re-elected.
Vice-President—F. W. Bishop.
Secretary—M. K. Ells, re-elected.
Assistant Secretary—S. H. Trenholm, re-elected.
Treasurer—Geo. W. Moore, re-elected.
Auditors—W. M. Black and J. Elliott Smith, re-elected.
Directors—F. H. Johnson, A. C. Starr, S. B. Chute and A. E. McMahone.
Co-Vice Presidents—re-elected.
Publishing Committee—The President, Secretary and A. C. Starr.

THE FUTURE OF OUR HORTICULTURAL EXHIBITIONS.

was the theme of talks by R. J. Messenger and Prof. M. Cumming, which evoked considerable pro and con discussion. Mr. Messenger outlined the past history of Nova Scotia's horti-

Truth!

THIS is *truth*. It would not bear our signature otherwise. Neither could we dare to make such a positive offer.

Truth:

Regal Flour *must* yield the *best quality* and the *utmost quantity* of bread per barrel of any you have ever known. It *must* make light, white bread and flaky pastry.

Protection:

If it doesn't your dealer will give back your money; because our signature was not signed to the truth. Then we lose. For we must pay your dealer. And, worse still, you will think ill of Regal Flour. Lest you forget—tear this out and pin to your flour barrel.

T. W. BOYD & SON,
27 Notre Dame St. West, Montreal.

cultural exhibitions which showed that they had fallen into a rut where they were unable to accomplish the result for which they had been originated. He prophesied that the education of the people at home and abroad re Nova Scotia's fruit growing possibilities demands a better exhibition. Nova Scotia's products must be more prominently advertised and until this is done Nova Scotia will not come into her own. Nova Scotia was the peer of all Canadian provinces in point of climatic conditions for fruit-growing and in natural resources, so much so that with due warning her people could be self-sustaining without looking to any other source for their sustenance, yet the province was very little known on account of lack of systematic advertising.

Nova Scotia's fruit required better and more extensive advertising both at home and abroad. The annual fruit show held in the Valley was not accomplishing results—it was only a case of one fruit grower showing his fruit to another fruit grower. While this function produced a friendly rivalry among the growers it did not further the cause of bringing the fruit to the attention of the outside world to any extent. In order to accomplish the latter result, Mr. Messenger recommended that the fruit exhibition be held in Halifax, the principle shipping port and capital of the province. The best way to advertise abroad was to put fruit on the market in the best possible condition. Ordinary products will not do when other countries are putting on exhibitions that are talked of the world over.

Nova Scotia must put on commercial exhibits—car lots of fruit; plate exhibits are a thing of the past. By making these two changes viz. making it of an attractive size and placing where outsiders can see it, some good would surely result.

It was also a mistake to put on a fruit show while fruit growers were busy in their orchards as then it was next to impossible to get exhibitors or spectators.

The exhibits of fruit and vegetables could be selected at picking and harvesting time and the exhibition put on at Halifax in November and allowed to remain then for two or three weevs. The staff of the Halifax Exhibition could look after the Fruit bition. The fruit exhibition should be eliminated from the early fall show at Halifax and the money devoted thereto at present should be utilized in swelling the prize list of the Provincial Fruit Fair, which should be held every third year or oftener if desired. A man should also be appointed to visit various sections of the province and solicit exhibits and cash donations and in other ways assist in placing the fair on a broader basis.

PROF. M. CUMMING

followed Mr. Messenger. He did not wish to be associated with any funcfunctory manner. Fruit-growing was tion that was carried on in a perone of the province's most valuable assets, and fruit growers should ask themselves the question: Are we progressing through the use of present fruit exhibition methods? If not, a change should be made. He concurred with Mr. Messenger in his ideas of a large commercial fruit exhibition at Halifax. He also suggested the idea of taking a portion of the exhibit and displaying it in Sydney and other large consuming centres.

F. S. Cox, editor of the Middleton Outlook, strongly advocated the continuance of the Valley Show. He also thought the government should run a fruit exhibit train from Halifax to Vancouver stopping at the principal towns enroute, on the same plan as farming special trains are conducted.

THE HORSE.

How About the Horse?

Will the horse maintain his place, or will he become extinct under the excitement and craze that has taken hold of all classes of people able to own a horse or automobile? A few years ago it seemed that there was room for both automobile and horse, but latterly the automobile has to a very large extent captured the labor and service formerly performed by the horse.

The man who has grown up with the horse and learned to appreciate the serviceable qualities of this animal; the man who is really in sympathy with this feature of God's creation, is very slow to concede his displacement in all that pertains to power and the utility of implement operation. The horse to the horse man, to the horse fancier, is the most convenient thing on the farm or about the place. He is always ready for a trip anywhere, any time, any kind of weather, over any kind of road, day or night, and when you understand the ability of the horse in power and endurance you need scarcely doubt your safe arrival at the end of the road on the trip planned or undertaken.

There are all kinds of horses, however, good horses and bad horses, There is only one kind worth owning and keeping—the good, well-bred, serviceable horse, for saddle, harness or work purposes. This implies three types of horse generally, though the former two qualifications may be found in the same horse—the riding horse and the buggy or carriage horse. The draft horses, or some of his crosses, comprise the horse fitted for all kinds of power labor on the farm or to the heavy load on the road.

To the horseman, to the lover of animal life, what can take the place of the well-mated, stylish, finely-equipped driving team, full of animation and spirit, almost akin to human existence? There is an unconscious animation creeps into the soul of man when he pulls the reins over such a team that no inanimate object or device can ever suggest or convey. The fine driving team, the single driver, the real saddle horse and the steady farm team of all work will be more popular and more sought after within the closing of the next decade than they are today. The horse will live on in the estimation of man and the coming generations will know him, as in the past, the beast of labor, the friend of humanity.

Grey Horses.

Grey horses are of many different shades, from the highest silver to the darkest iron-grey. There are few perfectly white horses met with, and the majority of white horses are those that have become so. Light greys begin to grow white by the time they are five years old, especially if they have not much dark colouring about their joints, and herein lies a danger that the intending purchaser of the gey horse will do well to take into consideration. They are very subject to a special disease, known as melanosis or "black cancer." Melanosis is, with rare exceptions in the grey roan and light chestnut, confined to grey horses, and becomes developed as they whiten with age, the pigmentary matter that used to colour the hair being deposited in tne tumours, and these melanotic tumors, though generally developed under the surface of the tail, and around the anus or vagina, or the perineum, are found in all parts of the body, including the vital organs, especially the heart, liver, and spleen, and are quite incurable.

Without being moved by considerations relating to difficulties in cleaning the grey animal, or keeping him clean, we should strongly advise the horse buyer, other things being equal, to eschew the light grey on account of his liability to disease, for in spite of the old saying that "a good horse cannot be of a bad colour," there are objections to greys.—Pateley Bridge.

The Horses Legs.

A striking change is noticeable in the attitude taken in regard to the hairy leg of the cart horse. It was considered at one time a sign of "faddism" to object to the appendage, and those who pointed out that the hair was a nuisance in the field, and caused great inconvenience and loss of time, were met with the bald statement that "plenty of hair" denoted "plenty of bone," and that the merit more than compensated for the defect. The fact that the hairy leg frequently led to those faults in management which brought about grease and other troubles in the extremities was either ignored or considered to be covered in the foregoing statement. Breeders for exhibition went in, as they do still, for an abundance of "feather," and the greater the amount the better was the exhibitor pleased. We are far from denying absolutely that there is a connection between the feather and the bone, but the method of judging, which has come to regard the hair as the sign of bone, is a bad one when we know that the hair itself is felt to be a drawback. It has led to the artificial encouragement of the feather, to the making much of a feature that may be accepted as a necessary evil, if it be associated with and inseparable from other good points, but which in itself is far from desirable, and it is satisfactory that this view is becoming recognized. Shire horse breeders are finding that there are other breeds of horses in the world, good draught horses, that are preferred because they have clean legs, and that the fact that practical farmers dislike unnecessary trouble with their teams is having its effect on the relative demand for the Shire and the Percheron and Belgian draught horses. Our live stock shows have done much for all British breeds of stock in the past, and may do much in the future; but the trend of public opinion must be taken into account, and any rules or "fads" which result in the depreciation for practical purposes of our animals must be kept in check.—Mark Lane Express.

Carrots for Horses.

Carrots are by far the most suitable roots for horses, and where the land is suitable they certainly pay to grow for winter feeding, when there is nothing green or succulent available. There is not much to choose between the common red and the white Belgian so far as feeding properties are concerned, but the latter is by far the heaviest cropper, and in the eastern counties, Belgian carrots are largely grown for stock feed. With reference to their feeding properties, they rank next to parsnips in albuminoids and to sugar-beet in carbohydrates, and are in all respects superior to turnips, swedes and mangels, and better for horses than any of them. Carrots must not, of course, be made the staple diet of working horses, or be given in excestive quantities, and especially to horses whose work is hard, and performed at a rapid pace, because "hard condition" cannot be maintained on them. They will not replace grain. For sick or idle horses, or those at slow work, carrots may be used more freely. They possess alterative and slightly

Horsemen Attention!

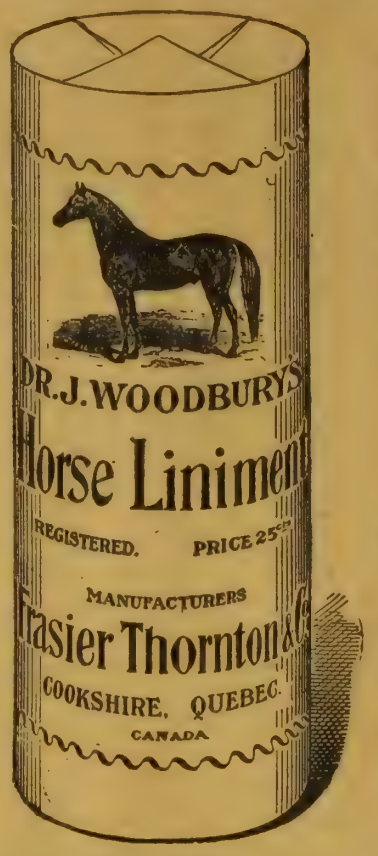
Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsemen of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

For Sale all Dealers

Price 25 cents



Do you know that "Dr. J. Woodbury's Horse Liniment" is endorsed by all the leading horsemen of the Dominion. Save and preserve the life of your horses by its use. It will cure and prevent disease common among horses.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

The Lawrence-Williams Co., Toronto, Ont.

diuretic properties, and are much better and safer than the heavy dose of saltpetre and sulphur that the cater is so fond of giving to his charges when, constantly on dry food, they get a bit "hunchy"! or than the tablespoonful of nitre which he puts into the into the weekly mash under the impression that it is "good for the water." The horse-owner will generally find it more to his advantage to allow carrots than to permit or encourage drugging. Carrots are excellent for horses suffering from chronic cough and broken wind, as well as from eruptive disease of the skin associated with indigestion. A few pieces of carrot will often start a sick horse eating; while, sliced or pulped, and mixed with the grain and chaff, they will often tempt the appetite of the poor or "picksome" feeder. In more ways than one carrots will help the poor hay of the season —rendering the chaff more palatable, and less likely to affect the wind injuriously.

Shoeing the Colt.

The crisis in a colt's foot, says an authority on the subject, is the first visit to the shoer. All the circumstances are usually unfavorable. The youngster has seldom been handled, perhaps never, if a filly, and, after much shouting and rough usage, is brought to the shop, already alarmed before the smith blows up the fire or attempts to lift a foot.

Only the phlegmatic get through this ordeal without a painful recollection and a dread of the forge, which in some instances never passes away. No subsequent kindness and gentleness can ever overcome the fear of a colt that has been hit over the head with a rasp for the offence of not knowing what was wanted of him.

The first shoe should be plain, stamped once, and not thick, and no portion of hoof should be taken away that is not removed in order to seat the shoe. The colt should be accustomed to a shoe which does not extend one fraction beyond the crust, but slightly within it, and he will be less likely to brush or interfere. The first set should not be for business, but for education, and then the wear will tell the shoer how best to shoe him for real work.

On no account should frog or sole be cut away. The health of the foot cannot be maintained in full functional activity if, by the rim of iron we call a shoe, we lift all otherparts of the plantar surface out of action. If the colt is merely shod for breaking in, then, when his lesson has been learned, he should have the shoes removed, if he is turned out again.—New York Farmer.

Horse Topics.

The hollow-sounding or rumbling noise which is made at times by geldings when trotting is familiar enough, but it is surprising how many horsemen are unable to account for it correctly. As often as not it is attributed to internal rumblings in the intestines, but that is utterly wide of the mark. The real explanation is that the sound is caused by the movement of air which is confined, or, so to speak, bottled up in the sheath, and which is alternately compressed and expelled by the violent motion when the horse trots. Possibly those unaware of the real cause may sometimes have wondered why mares never make this noise which is so common in geldings, but the reason for that is in face of this explanation clear enough. Entries rarely emit the sound, the reason being that their sheath is generally of much smaller size than in geldings, so affording less opportunity and room for air to get bottled up therein. The larger and more pendulous sheath is a result of castration. This rumbling noise therefore portends nothing, excepting that sometimes when unusually persistent, it indicates that there is an undue accumulation of sebaceous material at the orifice of the sheath, which it would be well to remove. Such accumulations may occasionally give rise to a certain degree of discomfort. Tne noise itself can usually be prevented by inserting a wad of medicated cotton wool in the orifice when the horse is taken out, removing it again on the animal's return to the stable.

Horse Chat

Many a good colt has been ruined by high living and close confinement.

The all-round general purpose horse is too likely to turn out like most Jack-of-all-trades.

If the colt be given liberal feeding it should be afforded plenty of exercise. The two must go together.

Always remember that the best time to start a colt in the way it should go, both in feeding and training, is when it is very young.

About as much waste matter is expelled from the body of the horse by the pores of the skin as by the bowels, and it is just as necessary to to keep them open as it is to keep the bowels open and in good condition. This means the use of the comb and brush.

A good tool for grooming the horse is a stiff broom with the handle cut off to a convenient length. This affords a good brush that can be brought to bear on the horse's coat and removes, not only a great deal of dust, but makes the coat bright and invigorates the skin.

The driver who whips and kicks and jerks his horse does not get the best results from the grain and hay he feeds them, nor can the horse give its best efforts if it is in constant dread of a blow or a jerk. So be kind to him, build up his confidence in you and try to put flesh on his bones and endurance in his muscles. Always give the horse the benefit of the doubt.

FREE-FARM ACCOUNT BOOK

Bickmore's Farm Account Book will be sent free to any farmer who will tell us who and where he is. This book is arranged to keep all accounts in simple form—more simple and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborers' time record; and section for personal accounts. **64 pages, for ink or pencil.** Not a cheap affair. Its quality is in keeping with **BICKMORE'S** Gall Cure, a soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. **Bickmore's** Gall Cure heals and cures **Harness and Saddle Galls; Rope Burn, Cuts, Scratches, Grease Heel,** etc. You don't have to lay the horse off. **Bickmore's cures while the horse works.** Great thing for sore teats in cows. The work-horse trade mark on every box. None genuine without it. Be sure to ask for **Bickmore's** Gall Cure when you go to buy and do not take a substitute. Farm Account Book is ready. Send today.

33. $1.00 in goods donated by Black & Co., for best pair of pigeons —P. E. I. P. A.

1 34. $1.00 donated by W. W. Stanley, for the best cockerel in all solid colored varieties—J. J. McKinnon.

35. $1.00 donated by W. W. Stanley for best cockerel in all parti colored varieties—J. J. McKinnon.

The Cape Breton Poultry Show.

The poultry show recently held in North Sydney under the auspices of the Cape Breton Poultry Association had no fewer than 501 birds. Over a hundred birds more than last year.

Frank E. Jackson and a committee of enthusiastic North Sydney poultry fanciers managed the show and J. P. Landry, Truro, placed the awards.

Prof. M. Cumming and John Bright Live Stock Commissioner, visited the show and spoke encouragingly of the general appearance of the exhibit.

Plucking contests were conducted—one for boys and another for men. At the latter contest, H. W. Corning, M. L. A., Yarmouth, acted as timekeeper and judge.

Following is a list of prize winners:

MOTTLED ANCONAS.—Cock— 1, W. Vooght; 2, H. W. Lovett. Hen—1 and 2, H. W. Lovett; 3, W. M. Vooght. Cockerel—1, H. W. Lovett; 2, M. W. Ross. Pullet—1 and 2, H. W. Lovett; 3, M. W. Ross.

BARRED PLYMOUTH ROCK.—Cock, 1, E. J. Johnson; 2, T. C. Munn. Hen—1, 2 and 3, T. C. Munn. Cockerel—1, W. Vooght; 2, T. C. Munn; 3, J. Munro. Pullet—1, T. C. Munn; 2, W. Vooght; 3, Cliff Thompson.

WHITE PLYMOUTH ROCKS.—Cock—1, R. M. Jackson. Hen—1, R. M. Jacvson. Hen—1, R. M. Jackson; 2, Geo. Musgrove; 3, Jas. Munn. Cockerel—1, Jas. Munro; 2, F. L. Kelly; 3, R. M. Jackson. Pullet—1, Jas. Munro; 2, R. M. Jackson; 3, F L. Kelly.

SILVER LACED WYANDOTTE.—Cock—1, F. H. Rudderham. Hen—1, F. H. Rudderham; 2 and 3, C. F. McDonald. Cockerel—1 and 2, John McDonald; 3, W. Vooght. Pullet—1, F. H. Rudderham; 2, W. M. Vooght.

GOLDEN, PARTRIDGE and COLUMBIAN WYANDOTTES.— All awards go to T. C. Munn, no competition.

WHITE WYANDOTTE.—Cock—1 and 2, Fred Jackson; 3, M. W. Ross. Hen—1, Fred Jackson; 2 and 3, M. W. Ross. Cockerel—1, 2 and 3, James Munro. Pullet—1, M. W. Ross; 2 and 3, Fred Jackson.

S. C. RHODE ISLAND RED.—Cock—1, C. Thompson; 1, C. W. Lovett. Hen—1 and 3, C. Thompson; 2, C. W. Lovett. Cockerel—1, T. C. Munn; 2, C. Thompson; 3, W. Vooght. Pullet—1, T. C. Munn; 2, C. Thompson; 3, J. Barrington.

R. C. RHODE ISLAND RED—Cock—1 and 3, C. Johnson; 2. H. W. Lovett Hen—1, H. W. Lovett; 2, A. B. McPhee; 3, C. Thompson. Cockerel—1, C. Johnston; 2, G. Musgrave; 3, H. W. Lovett. Pullet—1 and 3, G. Musgrave; 3, C. Johnston.

WHITE LEGHORN—Cock—1, J. Barrington; 2, H. W. Lovett. Hen—1 and 2, Jas. Munro; 3, C. Johnston. Cockerel—1, 2 and 3, C. Johnston. Pullet—1 and 2, C. Johnston; 3, H. W. Lovett.

S. C. BROWN LEGHORN.—Cock—1, W. Vooght; 2, H. W. Lovett; 3, Fred Jackson. Hen—1, G. Musgrave; 2, M. W. Ross; 3, W. Vooght. Cockerel—1 and 2, Fred Jackson; 3, W. Vooght. Pullet—1 and 3, Fred Jackston; 2, C. Johnston.

R. C. BROWN LEGHORN—C. Johnston won all firsts. Geo. Musgrave won 2nd cockerel.

BUFF LEGHORN.—1st cockerel, 3, pullet. Geo. Musgrave. 1 and 2 Pullet, W. M. Vooght.

BLACK MINORCA.—Cock— 1, W. Gillis; 2, W. Vooght. Hen—1, M. W. Ross; 2, Cliff Thompson. Cockerel—1, S. D. Burns; 2, W. Baendale; 3, W. Gillis. Pullet—1, W. Basendale; 2, and 3, W. Gillis.

WHITE MINORCA—Cock—1 and 2, M. W. Ross. Hen, 1 and 3, M. W. Ross; 2, Clif Thompson. Cockerel—1, Wm. Scott; 2, M. W. Ross. Pullet—1 and 3, M. W. Ross; 2, Wm. Scott.

BUFF ORPINGTON—Hen—1, W. M. Vooght. Cockerel—1 and 2, James Munro. Pullet—1 and 3, Jas. Munro; 2, W. M. Vooght.

GAMES (any variety)— All awards went to Henry Marr, no competition.

ANY OTHER VARIETY.—Cock—1, Jas. Munro; Hen—1, C. Thompson; 2, James Munro. Cockerel—1, T. Hart; 2 James Hough. Pullet—1, James Hough; 2, Jas. Munro; 3, T. C. Hart.

BUFF COCHIN BANTAM—Cock—1, F. McDonald; 2, H. W. Lovett. Hen, 1 and 2, H. W. Lovett. Cockerel—1, C. W. Lovett. Pullet—1, C. W. Lovett.

BLACK COCHIN BANTAM—Cock—1, H. W. Lovett. Hen—1 and 2, H. W. Lovett. Cockerel—1, C. W. Lovett. Pullet—1, C. W. Lovett.

GAME BANTAM (any variety) — Cock—1, M. W. Ross. Hen—1 and 2, M. W. Ross. Cockerel—1, C. Thompson; 2 and 3, H. W. Lovett. Pullet—1, C. Thompson; 2, G. Musgrave; 3, H. W. Lovett.

A. O. V. BANTAMS.—Hen—1, C. Thompson; 2, C. Thompson. Cockerel—1, M. W. Ross. Pullet—1, M. W. Ross.

125-Egg Incubator and Brooder Both For **$13.75**

If ordered together we send both machines for only $13.75 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Especially adapted to Canadian climate. Incubator and Brooder shipped complete with thermometers, lamps, egg testers—ready to use when you get them. Five year guarantee—30 days trial. Incubators finished in natural colors showing the high grade California Redwood lumber used—not painted to cover inferior material. If you will compare our machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our price of $13.75 is for **both** Incubator and Brooder and covers freight and duty charges. Send for FREE catalog today, or send in your order and save time.

Parsons' Pills For Constipation

NEXT TO CONSUMPTION

THERE ARE MORE DEATHS

From PNEUMONIA

Than Any Other Lung Trouble.

Pneumonia is nothing more or less than what used to be called "Inflammation of the Lungs."

Consumption may be contracted from others, but as a rule pneumonia is caused by exposure to cold and wet, and if the cold is not attended to immediately serious results are liable to follow.

There is only one way to prevent pneumonia and that is to cure the cold on its first appearance.

Dr. Wood's Norway Pine Syrup will do this for you if you will only take it in time.

Dr. Wood's Norway Pine Syrup contains all the essence and lung healing powers of the famous Norway Pine tree.

Mr. Hugh McLeod, Esterhazy, Sask., writes:—"My little boy took a very severe cold, and it developed into pneumonia. The doctor said he could not live. I got some of your Dr. Wood's Norway Pine Syrup, and he began to improve. Now he is a strong healthy child, and shows no sign of it ever coming back."

The price of this remedy is 25 and 50 cents per bottle. It is put up in a yellow wrapper; 3 pine trees the trade mark, and is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

COMFORT IN THE RURAL HOME

The installation of a GOOD HEALTH CHEMICAL CLOSET in your home means health--convenience--comfort--for the whole family. Not a luxury but a necessity. A postal will bring you full particulars. Address

N. S. Poultrymen Organize.

At the close of the poultry meeting held at the Agricultural College on Thursday, Jan. 17th, the poultrymen of Nova Scotia organized. This is a move in the right direction and speaks well for the future of the poultry industry in the province.

The object of the organization is to assist in holding shows and secure money or prizes in order to better assist the industry.

The shows which have been started have a grand record and it has encouraged the poultrymen to carry the work on and to promote more shows in other parts of the Province.

The following are the officers:

Hon. Pres.—M. Cumming, Truro.

President—I. C. Craig, Amherst.

Vice-Pres.—W. W. Osborne, New Glasgow.

Sec.-Treas.—J. P. Landry, Truro; N. S.

Executive Committee—E. E. Frehill New Glasgow; W. A. Godfrey, Yarmouth; Frank Jackson, North Sydney; W. W. Henry, Shubenacadie; C. H. Wisener, Pictou, N. S.; Dr. Webster, Pictou, N. S.; Geo. Thompson, Halifax.

Are You Losing Money ?

Following is a sample of the many inquiries that reach this office, which goes to show that breeders of pure-bred stock are losing money by not taking full advantage of the advertising opdortunities offered by the Maritime Farmer:

Westville, N. S.

Editor Maritime Farmer:

Please notify some breeders of White Holland Turkeys and Silver Spangled Hamburg hens to advertise their wares in your paper. I want to get their address.

Respectfully yours,

J. J. CRAWFORD,

Box 181, Westville, N. S.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

"If you please, sir—"

Mr. Creakle whispered, "Hah! "Hah! What's this?" and bent his eyes upon me, as if he would have burnt me up with them.

"If you please, sir," I faltered, "if I might be allowed (I am very sorry indeed, sir, for what I did) to take this writing off, before the boys come back——"

Whether Mr. Creakle was in earnest or whether he only did it to frighten me, I don't know, but he made a burst out of his chair, before which I precipitately retreated, without waiting for the escort of the man with the wooden leg and never once stopped until I reached my own bedroom, where, finding I was not pursued, I went to bed, as it was time, and lay quaking, for a couple of hours.

Next morning Mr. Sharp came back Mr. Sharp was the first master, and superior to Mr. Mell. Mr. Mell took his meals with the boys, but Mr. Sharp dined and supped at Mr. Creakle's table. He was a limp, delicate-looking gentleman, I thought, with a good deal of nose, and a way of carrying his head on one side, as if it were a little too heavy for him. His hair was very smooth and wavy, but I was informed by the very first boy who came back that it was a wig (a second-hand one he said), and that Mr. Sharp went out every Saturday afternoon to get it curled.

It was no other than Tommy Traddles who gave me this piece of intelligence. He was the first boy who returned. He introduced himself by informing me that I should find his name on the right-hand corner of the gate, over the top-bolt; upon which I said, "Traddles?" to which he replied, "The same," and then he asked me for a full account of myself and family.

It was a happy circumstance for me that Traddles came back first. He enjoyed my placard so much, that he saved me from the embarrassment of either disclosure or concealment, by presenting me to every other boy who came back, great or small, immediately on his arrival, in this form of introduction, "Look here! Here's a game!" Happily, too, the greater part of the boys came back low-spirited, and were not so boisterous at my expense as I had expected. Some of them certainly did dance about me like wild Indians, and the greater part could not resist the temptation of pretending that I was a dog, and patting and smoothing me, lest I should bite, and saying, "Lie down, sir!" and calling me Towzer. This was naturally confusing, among so many stramgers, and cost me some tears, but on the whole it was much better than I had anticipated.

I was not considered as being formally received into the school, however, until J. Steerforth arrived. Before this boy, who was reputed to be a great scholar, and was very good-looking, and at least half a dozen years my senior, I was carried as before a magistrate. He inquired, under a shed in the playground, into the particulars of my punishment, and was pleased to express his opinion that it was a "jolly shame;" for which I became bound to him ever afterwards.

"What money have you got, Copperfield?" he said, walking aside with me when he had disposed of my affair in these termt.

I told him seven shillings.

"You had better give it to me to take care of," he said. "At least, you can if you like. You needn't if you don't like."

I hastened to comply with his friendly suggestion, and opening Peggotty's purse, turned it upside down into his hand.

"Do you want to spend anything now?" he asked me.

"No, thank you," I replied.

"You can, if you like, you know," said Steerforth. "Say the word."

"No, thank you, sir," I repeated.

"Perhaps you'd like to spend a couple of shillings or so, in a bottle of currant wine by-and-by, up in the bedroom?" said Steerforth. "You belong to my bedroom, I find."

It certainly had not occurred to me before, but I said, Yes, I should like that.

"Very good," said Steerforth, "You'll be glad to spend another shilling or so, in almond cakes, I dare say?"

I said, Yes, I should like that too.

"And another shilling or so in biscuit, and another in fruit, eh?" said Steerforth. "I say, young Copperfield, you're going it!"

I smiled because he smiled, but I was a little troubled in my mind, too.

"Well!" said Steerforth. "We must make it stretch as far as we can; that's all. I'll do the best in my power for you. I can go out when I like, and I'll smuggle the prog in." With these words he put the money in his pocket, and kindly told me not to make myself uneasy; he would take care it should be all right.

He was as good as his word, if that were all right which I had a secret misgiving was nearly all wrong—for I feared it was a waste of my mother's two half-crowns—though I had preserved the piece of paper they were wrapped in: which was a precious saving. When we went up-stairs to bed, he produced the whole seven shillings' worth, and laid it out on my bed in the moonlight, saying:

"There you are, young Copperfield, and a royal spread you've got."

I couldn't think of doing the honors of the feast, at my time of life, while he was by; my hand shook at the very thought of it. I begged him to do me the favor of presiding; and my request being seconded by the other boys who were in that room, he acceded to it, and sat upon my pillow, handing round the viands—with perfect fairness, I must say—and dispensing the currant wine in a little glass without a foot, which was his own property. As to me, I sat on his left hand, and the rest were grouped about us, on the nearest beds and on the floor.

How well I recollect our sitting there, talking in whispers; or their talking, and my respectfully listening, I ought rather to say; the moonlight falling a little way into the room, through the window, painting a pale window on the floor, and the greater part of us in shadow, except when Steerforth dipped a match into a phosohorus-box, when he wanted to look for anything on the board, and shed a blue glare over us that was gone directly! A certain mysterious feeling, consequent on the darkness, the secrecy of the revel, and the whisper in which everything was said, steals over me again, and I listen to all they tell me with a vague feeling of solemnity and awe, which makes me glad that they are all so near, and frightens me (though I feign to laugh) when Traddles pretends to see a ghost in the corner.

I heard all kinds of things about the school and all belonging to it. I heard that Mr. Creakle had not preferred his claim of being a Tartar without reason; that he was the sternest and most severe of masters; that he laid about him, right and left, every day of his life, charging in among the boys like a trooper, and slashing away, unmercifully. That he knew nothing himself, but the art of slashing, being more ignorant (J. Steerforth said) than the lowest boy in the school;- that he had been, a good many years ago, a small hop-dealer in the Borough, and had taken to the schooling business after being bankrupt in hops, and making away with Mrs. Creakle's money. With a good deal more of the sort which I wondered how they knew.

I heard that the man with the wooden leg, whose name was Tungay, was an obstinate barbarian who had formerly assisted in the hop business, but had come into the scholastic line with Mr. Creakle, in consequence, as was supposed among the boys, of his having broken his leg in Mr. Creakle's service, and having done a deal of dishonest work for him, and knowing his secrets. I heard that with the single exception of Mr. Creakle, Tungay considered the whole establishment, masters and boys, as his natural enemies, and that the only delight of his life was to be sour and malicious. I heard that Mr. Creakle had a son, who had not been Tungay's friend, and who, assisting in the school, had once held some remonstrance with his father on an occasion when his dicipline was very cruelly excerised, and was supposed, besides, to have protested against his father's usage of his mother. I heard that Mr. Crealke had turned him out of doors, in consequence, and that Mrs. and Miss Creakle had been in a sad way, ever since.

But the greatest wonder that I heard of Mr. Creakle was, there being one boy in the school on whom he never ventured to lay a hand, and that boy being J. Steerforth. Steerforth himself confirmed this when it was stated, and said that he should like to begin to see him do it. On being asked by a mild boy (not me) how he would proceed if he did begin to see him do it, he dipped a match into his phosphorus-box on purpose to shed a glare over his reply, and said he would commence by knocking him down with a blow on the forehead from the seven-and sixpenny ink bottle that was always on the mantlepiece. We sat in the dark for some time, breathless.

I heard that Mr. Sharp and Mr. Mell were both supposed to be wretchedly paid: and that when there was hot and cold meat for dinner at Mr. Creakle's table, Mr. Sharp was always expected to say he preferred cold; which was again corroborated by J. Steerforth, the only parlor-boarder. I heard that Mr. Sharp's wig didn't fit him; and that he need not be so "bounceable"—smebody else said "bumptious"—about it, because his own red hair was very plainly to be seen behind.

I heard that one boy, who was a coal-merchant's son, came as a set off against the coal-bill, and was called, on that account, "Exchange or Barter"—a name selected from the arithmetic-book as expressing this arrangement. I heard that Miss Creakle was regarded by the school in general as being in love with Steerforth; and I am sure, as I sat in the dark, thinking of his nice voice, and his fine face, and his easy manner, and his curling hair, I thought it very likely. I heard that Mr. Mell was not a bad sort of a fellow, but hadn't a sixpence to bless himself with; and that these was no doubt that old Mrs. Mell, his mother, was as poor as Job. I thought of my breakfast then, and what had sounded like "My Charley!" but I was, I am glad to remember, as mute as a mouse about it.

The hearing of all this, and a good deal more, outlasted the banquet some time. The greater part of the guests had gone to bed as soon as the eating and drinking were over; and we, who had remained whispering and listening half undressed, at last betook ourselves to bed, too.

"Good night, young Copperfield,"

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

WOMAN'S MOST SUCCESSFUL MEDICINE

Known All Over The World —Known Only For The Good It Has Done.

We know of no other medicine which has been so successful in relieving the suffering of women, or received so many genuine testimonials, as has Lydia E. Pinkham's Vegetable Compound.

In nearly every community you will find women who have been restored to health by this famous medicine. Almost every woman you meet knows of the great good it has been doing among suffering women for the past 30 years.

Fox Creek, N. B.—"I have always had pains in the abdomen and a weakness there and often after meals a soreness in my stomach. Lydia E. Pinkham's VegetableCompound has done me much good. I am stronger, digestion is better and I can work with ambition. I have encouraged many mothers of families to take it as it is the best remedy in the world. You can publish this in the papers."—Mrs. WILLIAM S. BOURQUE, Fox Creek, N. B.

In the Pinkham Laboratory at Lynn, Mass., are files containing hundreds of thousands of letters from women seeking health, in which many openly state over their own signatures that they have regained their health by taking Lydia E. Pinkham's Vegetable Compound, many of whom state that it has saved them from surgical operations.

Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

Farmer Ads Are Business Getters

said Steerforth. "I'll take care of you."

"You're very kind," I gratefully returned. "I am very much obliged to you."

"You haven't got a sister, have you?" said Steerforth, yawning.

"No," I answered.

"That's a pity," said Steerforth. "If you had one, I should think she would have been a pretty, timid, little, bright-eyed sort of girl. I should have liked to know her. Good night young Copperfield."

"Good night, sir," I replied.

I thought of him very much after I went to bed, and raised myself, I recollect, to look at him where he lay in the moonlight, with his handsome face turned up, and his head reclining easily on his arm. He was a person of great power in my eyes; that was, of course, the reason of my mind running on him. No veiled future dimly glanced upon him in the moonbeams. There was no shadow picture of his footsteps, in the garden that I dreamed of walking in all night.

CHAPTER VII

My "First Half" at Salem House.

School began in earnest next day. A profound impression was made upon me, I remember, by the roar of voices in the schoolroom suddenly becoming hushed as death when Mr. Creakle entered after breakfast, and stood in the doorway looking round upon us like a giant in a story-book surveying his captives.

Tungay stood at Mr. Creakle's elbow. He had no occasion, I thought, to cry out "Silence!" so ferociously, for the boys were all struck speechless and motionless.

Mr. Creakle was seen to speak, and Tungay was heard, to this effect.

"Now, boys, this is a new half. Take care what you're about, in this new half. Come fresh up to the lessons, I advise you, for I come fresh up to the punishment. I won't flinch. It will be of no use your rubbing yourselves: you won't rub the marks out that I shall give you. Now get to work, every boy!"

When this dreadful exordium was over, and Tungay had stumped out again, Mr. Creakle came to where I sat, and told me that if I were famous for biting, he was famous for biting, too. He then showed me the cane, and asked me what I thought of that for a touch? Was it a sharp tooth, hey? Was it a double tooth, hey? Did it bite, hey? Did it bite? At every question he gave me a fleshy cut with it that made me writhe; so I was very soon made free of Salem House (as Steerforth said), and was very soon in tears also.

Not that I mean to say these were special marks of distinction, which only I received. On the contrary, a large majority of the boys (especially the smaller ones) were visited with similar instances of notice, as Mr. Creakle made the round of the schoolroom. Half the establishment was writhing and crying, before the day's work began; and how much of it had writhed and cried before the day's work was over, I am really afraid to recollect, lest I should seem to exaggerate.

(Continued in next issue!

Here is a message of hope and good cheer from Mrs. C. J. Martin, Boone Mill, Va., who is the mother of eighteen children. Mrs. Martin was cured of stomach trouble and constipation by Chamberlain's Tablets after five years of suffering, and now recommends these tablets to the public. Sold by all dealers.

For a sprain you will find Chamberlain's Liniment excellent. It allays the pain, removes the soreness, and soon restores the parts to a healthy condition. 25 and 50 cent bottles for sale by all dealers.

$5,000,000.00

FOR PEERLESS WAY POULTRYMEN

Into the pockets of the users of The Peerless Way last year went five million dollars made from the poultry these people raised. Yet chickens are scarce in Canada and eggs are the scarcest of all food commodities. That is positively the fact.

To-day there are not enough Canadian CHICKENS or EGGS to go around. Thousands of chickens and hundreds of thousands of dozens of eggs are being shipped into Canada from the United States and other countries to help meet the demand.

Yet there is a shortage! Eggs are commanding a tremendous price—chickens are worth dollars.

Now is the time to take advantage of this situation and make money out of it yourself. You can raise and sell 600 chickens this next year, and you will find a quick and sure market for every one of them. You can get the top notch price for all the hundreds of dozens of eggs that your poultry lay.

Let us tell you how!

Poultry raising is the best business for any farmer, any farmer's wife or farmer's child. The poultry crop is the one crop that never fails. It pays better for the time and money invested; the profit is surest; it isn't overcrowded and never will be.

Our book "When Poultry Pays," will show you. Let us send it to you. It is interesting; it is instructive, and it contains the proof.

You need this book. It will be mailed free. A post card will bring it.

Nova Scotia Fruit Growers Celebrate Their Golden Jubilee.

(Continued from page 307)

W. W. Pineo thought the Valley show was a one horse affair, and a waste of time and public money. All nonsense should be done away with and the fruit exhibition placed on a firm footing at Halifax.

L. D. Robinson, favored taking the show to Halifax.

R. S. Eaton said that after so many years of education which would now be looked after by the Short Courses it was time to turn to an advertising campaign and get started right by putting on a real fruit show at Halifax, and as an instance of what may be accomplished referred toMaxwell Smith's version of what the big Vancouver Fruit Show had done for British Columbia Fruit Growers.

S. B. Chute, representing the United Fruit Companies, favored doing away with tinsel shows and poor packs. He thought Halifax was the proper place for an N. S. fruit show.

A. E. McMahon scored the citizens of Halifax for their lack of interest in the provincial fair. They did not fully appreciate the patronage that the rest of the province was extending to them. He favored carrying the exhibition to foreign markets. S. C. Spurr, R. W. Starr, Prof. W. S. Blair and others favored Halifax as a centre for the show.

The following resolutions were then introduced and carried.
centres.

Whereas, the Nova Scotia Horticultural Exhibition which, during the past six years, has been held in various towns in Hants, Kings and Annapolis Counties, while affording a good opportunity for educational and competitive exhibits has failed in what we believe to be one of the most important functions of a Provincial exhibition viz: the exhibition of our fruit to the consuming public and hence the advertising of the industry and

Whereas, its location in these towns while attracting a large exhibit of fruit, has not been favorable to the exhibition of commercial packages of fruit and

Whereas, we believe that these results can only be achieved in one of the larger centres of the province and

Whereas, the exhibition has now been held an even number of times in each of the aforementioned counties.

Therefore resolved, that we, the N. S. F. G. A. do recommend that the next N. S. Horticultural exhibition be held in Halifax, the capital and leading shipping and public centre of the Province and that a strong committee from this Association be appointed to work with the Secretary for Agriculture to take steps toward inaugurating a larger and better exhibition.

Messrs. W. W. Pineo, A. E. McMahon, E. C. Schaffner, R. J. Messenger and Wm. O'Brien were appointed a committee to work out the details in connection with the proposed change.

* * * *

Wheras, the present Government Aid to the N. S. F. G. A. is deemed by the officers to be inadequate to the successful running of the Association.

Therefore resolved, that we petition the Government of N. S. to increase the grant to $500 per year and also tp pay for the printing of the annual report and that a committee be appointed to press the matter before the Government at Halifax.

* * * *

Whereas, efforts are being made by certain nursery firms to secure modifications in the regulations governing the importation of nursery stock into Nova Scotia and

Whereas, any such modification would be detrimental to the fruit industry of our Province.

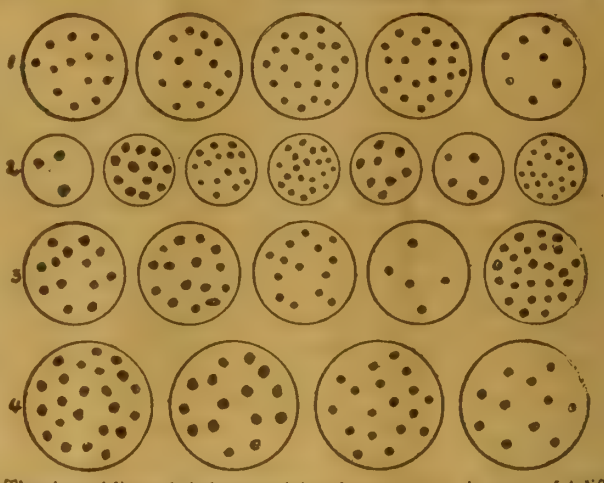
Therefore resolved, that we, the Fruit Growers assembled at our annual convention at Middleton, Jan. 29th, 1913, place ourselves on record as urging on our government the pressing necessity of the strict enforcement of aforementioned regulations.

FREE $300.00 IN PRIZES

IN THE GREAT DOT PUZZLE CONTEST

A Genuine Contest for WISE HEADS!

SOLVE THIS PUZZLE



The above 4 lines of circles containing dots represent the name of 4 different things described after each line. What are they?

HOW TO SOLVE THIS GREAT PUZZLE

Each circle of dots represents 1 letter of the word and the number of dots in each circle determine the letter in its relation to the alphabet. For instance: A is represented by 1 dot because it is the first letter in the alphabet, B is represented by 2 dots because it is the 2nd letter in the alphabet, C is represented by 3 dots because it is the 3rd letter in the alphabet. Now, with these simple instructions and a little patience you can soon have the puzzle solved. To give you a little assistance the 1st letter of the first word is M, because the circle contains 13 dots and M is the 13th letter of the alphabet.

After you have found the solution write your answer neatly on a piece of paper with your name and address and anything else you wish to say about the contest and send it in to us.

Those who send in the Correct or the Nearest Correct Answers; whose answers are the neatest and who live up to the condition of the contest (read rules of contest below), will win the following grand prizes:—

1st Prize, $125.00 in cash.
2nd " 50.00 "
3rd " 25.00 "
4th " 15.00 "
5th " Gent's Watch. Value $10.00.
6th " Ladies' Ring. Value $10.00.
7th " Fine Clock. Value $10.00.
8th " 44-Piece Dinner Set. Value $10.00.
9th Prize, Mission Upholstered Rocker Value $10.00.
10th Prize, Violin. Value $10.00.
11th Prize, Gillette Safety Razor. Value $5.00.
12th Prize, Waterman Fountain Pen Value $5.00.
13th Prize, Glass Water Set. Value $5.00.
14th Prize, Large French Doll. Value $5.00.
15th Prize, Silverware Set. Value $5.00.

READ THE SIMPLE RULES OF THIS CONTEST

1. Contestants may send in as many answers as they wish, but only one answer can win a prize. (2) Only 1 person in each family will be allowed to compete. (3) No employees of ours or any relation of any employee will be allowed to compete. (4) Children under 12 years of age will not be permitted to compete. (5) Write only on one side of the paper. (6) All letters must be fully prepaid in postage. We will not accept answers upon which we will have to pay postage. (7) The decision of the judges must be accepted as final. The judging will be in the hands of 3 gentlemen of integrity who are absolutely disinterested. (8) This contest is absolutely free. You are not asked to spend one cent of your money or buy anything to enter. As soon as we receive your answer we will immediately tell you if you are right, and how the prizes will be distributed. We guarantee the awarding of the prizes described above according to decision of the judges.

Address all answers to **Contest Department, 220**

NEW LIFE REMEDY COMPANY, TORONTO, ONT.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you**, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience**, we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhoea** or **Whitish discharges, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths**, also **pains in the head; back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address**, tell me how you suffer, if you wish, and **I** will send you the treatment for your case, entirely free, in plain wrapper, by return mail. **I** will also send you **free of cost**, my book—**"WOMAN'S OWN MEDICAL ADVISER"** with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers** of **Daughters, I** will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, **I** can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes women well, strong, plump and robust. **Just send me your address**, and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - - - - WINDSOR, Ont.

Whereas, the custom of spraying orchards when the trees are in blossom is becoming common and

Whereas, the custom is detrimental to the fruit growers on account of killing insects which visit the blossoms.

Therefore resolved, that the Government be asked to pass restrictive legislation similar to that adopted by the Province of Ontario for the protection of bees.

Moved by F. H. Johnson.
Seconded by F. Wiltshire.

* * * *

Another resolution unanimously passed asked that the government conduct spraying demonstrations in various centres of the fruit growing sections.

SPRAYS AND SPRAYING

was the subject of a most instructive and practical address by Prof. J. P. Stewart. We will endeavor to give our readers a full synopsis of this address in a future issue.

ON WEDNESDAY EVENING

a letter from John N. Chute, European representative of the United Fruit Companies was read by the Secretary, in which was given a vivid description of market and marketing conditions in the various industrial centres of Great Britain. The letter in question as well as a paper read by W. W. Moore, Chief of the Market Division, touching on some phases of the export apple trade will be published in these columns.

Nova Scotia Fruits in Western Markets was the subject of a discourse by C. W. Baxter, Chief Fruit Instructor, Prairie Provinces. He advised shipping fruit to Manitoba in barrels and to the other Prairie Provinces in boxes. He thought Nova Scotia fruit growers would profit by advertising their fruit more extensively in the West. He also had a good word for the co-operative movement—a movement which was responsible for the present status of Nova Scotia fruit sales in the West.

At the close of Wednesday night's session votes of thanks were tendered to the town of Middleton, W. W. Moore, Inspector Baxter and to Prof. Stewart.

As Prof. Stewart purposed visiting Prof. F. C. Sears, at Amherst, Mass. on his homeward bound journey, the Association asked him to convey to Prof. Sears the fraternal greetings of the Fruit Growers, with whom he had so faithfully labored as a co-league during his sojourn in Nova Scotia.

"Thinning Apples on a Commercial Basis" by John Buchanan and J. M. Robinson, Berwick. "The Brown Tail and Gipsy Moth" by Dr. Robert Matherson and "Is the Brown Tail Moth Spreading in Nova Scotia," by Inspector Saunders, Roundhill, were the subjects up for discussion at the closing session on Thursday morning. Messrs. Buchanan and Robinson showed by facts and figures gleaned from their own personal experiments that it was a paying proposition to thin some varieeies of fruit immediately after the June drop.

Dr. Matherson gave the life history of the Brown and Gipsy moths and strongly urged the fruit growers to co-operate with the inspectors who are actively engaged in locating and destroying the pest.

Acrording to Inspector Saunders' report the Brown Tail moth has a firm foothold in Nova Scotia. It is found quite plentiful in the little valleys opening from the main valleys into the North and South Mountains and only the concerted efforts of fruit growers, farmers and all concerned can stay its ravages and keep it under control.

The fiftieth annual convention was the largest in the history of the Fruit Growers and each and every member felt that they had most interesting and instructive sessions.

MAKES LIFE EASIER

To lessen household drudgery and make life easier for housewives is the basis on which our establishment is founded, and the growth of our business is due entirely to the fact that we have accomplished that object.

The patented and exclusive features that make the "Playtime" superior didn't "just happen." They are the results of years of experience and study. In OUR opinion it is the best washing machine ever made for farm use. We would like YOUR opinion after a careful examination of its merits. See it at your dealer's or send to us for full information

WAKE UP, WEAK MEN!

GET SOME LIFE INTO YOU

What's the use of dragging your legs about like a wooden person. Feel like a person with spirit. Away with the pains and aches; off with this wretched feeling as if you were eighty years old and had one foot in the grave. Come and let me put life into your nerves; let me give you a new supply of youthful energy. Let me make you feel like throwing your chest out and your head up, and saying to yourself: "I AM STRONG AND HEALTHY!" Let me give you back that old feeling of youthful fire, vim and courage. I can do it, so that in two months you will wonder that you ever felt so slow and pokey as you do now.

It is for men who open their eyes in the morning upon a world that looks blue and discouraging, for men who feel tired, despondent and out of luck; who have lost the fighting spirit—those fellows who have almost concluded that nothing is worth fighting for—who have pains in the back, and who can't get rest from their sleep, and who wish that they were as strong as they used to be. It is all a matter of nervous energy—that is what ambition comes from—and that is what you can get from Dr. McLaughlin's Electric Belt. It is an invigorator of men.

It will make you strong. It will send the life blood dancing through your veins, you will feel the exhilarating spark warm your frame, the bright flash that comes to your eye, and a firm grip to your hand, and you will be able to meet your fellow man and feel that what others are capable of doing is not impossible to you. This grand appliance has brought strength, ambition and happiness to thousands in the past year. What would you not sacrifice to feel as you did a few years ago, to have the same snap and energy, the same gladness, joyous, light-hearted spirit, and the physical strength you used to have? You know you are not the same man, and you know you would like to be. You can be.

Dr. McLaughlin's Electric Belt makes you noble; it causes the nerves to tingle with the joyous exhilaration of youth; it fills the heart with a feeling of gladness, makes everything look right, and makes the nervous like bars of steel. It has cured Debility, Weakness of every kind, whether in Nerves, Stomach, Heart, Liver or Kidneys, Rheumatism, Pains in the Back and Shoulders, Sciatica, Lumbago, Indigestion, Neuralgia, Constipation, Dyspepsia, and all troubles where new life can restore health. It does all this while you sleep, by pouring electricity, which is Nature's energy, into your nerves and blood. Electricity is life to the vital parts; when they are weak it will make them strong.

Now what would you give to be able to say as these men do—that you are twice the man you have ever been before. You can do so, and it will cost you nothing until you experience these grand benefits. I have cured thousands of men who have squandered the savings of years in useless doctoring.

READ WHAT THE CURED SAY:

Read the Proof—Nothing Short of Miracles Are Being Performed Every Day

Dear Sir,—I write to let you know that I am highly pleased with the work your Belt has done for me. It has done what no medicine would do. For years I have had to take medicine every night for constipation, and now your Belt has completely cured that trouble, also dyspepsia. I cannot thank you too highly for what you have done for me. I am recommending your Belt to all troubled with similar ailments, and no doubt you will hear from some of them soon.

J. ALLAN, North Nation Mills, Que.

Dear Sir,—I wish to say that I think I can honestly say that I am cured. I am perfectly satisfied with the results of wearing the Belt. Before using it I could not go more than two weeks without medicine of some kind, and I often wondered if the time would ever come when I could stop taking it. Now I have not taken a drop of medicine for the last three months, and I do not need it either. I have no more headaches or distress after eating or colic or scalding urine. I can eat anything in the line of food with no bad effect.

ANGUS McKENZIE, Mitchell's Bay, Ont.

My Belt is easy to use, put it on when you go to bed, you feel the glowing heat from it (no sting or burn, as in the old style belts) and you feel the nerves tingle with the new life flowing into them. You get up in the morning feeling like a two-year-old.

Wherever you are, I think I can give you the name of a man in your own town that I have cured. Just send me your address and let me try. This is my twenty-fourth year in the business of pumping new vim into worn out humanity, and I've got cures in nearly every town on the map.

If you will come and see me, I'll explain it to you. If you can't call, let me send you my books, full of the things a man finds inspiring to strength and courage. Free if you send this ad.

Office Hours:--9 a.m. to 6 p.m. Wednesday and Saturday to 9 p.m.

Gates' Nerve Ointment
For Frost Bites

C. Gates, Son & Co.,
Middleton, N S.

Gentlemen:--I had the misfortune to freeze my toe which caused me a great deal of suffering, and although I had it treated, yet without success till I used your Nerve Ointment, which has completely cured it, and I have no hesidency in recommending it to others as the best I ever used,

Yours sincerely,
Matthew Wood,
Point Phillip, N. S.

The Prevention of Colds

This is the season of the year when colds are taken more easily, due to carelessness more often than any cause, and so many diseases may follow in the train of what we term an ordinary cold that we need to avoid the beginning of evil; and colds, aside from the temparary discomfort, are apt to leave an enfeebled system upon which some serious disease may fasten. It is much better to take the trouble to wear extra wraps and put on good rubbers when one must be out on damp or very cold days than to suffer from neglect of such precautions. Damp feet are especially provocative of bodily chill and the ankles should always be well covered in cold weather. If the feet and legs are cold and damp, the blood flowing through them quickly becomes (nilled and the same may be said of cold hands and wrists. This may produce a serious chill in many important organs, and the slight discomfort of wearing overshoes and heavy glopes will be more than compensated by the protection from far worse ills.

In times of severe cold weather or long exposure in moderately cold weather, a good supply of nourishing food, not difficult of digestion, is very valuable in maintaining the bodily temperature and thus warding off colds. Never omit regdlar bathing, for unless the skin is in active condition the cold will close the pores and favor congestion or other diseases. One cause productive of harm is damp cellars and dampness of dwelling rooms, as dampness will bring on colds, rheumatism and many other ills. One of the chief causes of colds in persons living in rooms heated with stoves lies in the extreme dryness of tne air. A vessel of clean water on the stove will supply moisture to the atmosphere, and this lessens the irritation in the nose and throat that is caused by the dry air. When radiators are used a damp cloth hung near (he radiator will be of help.

One mother says she keeps her children free from colds and other diseases by allowing them to eat freely of onions and apples all through the winter, and she has taught them to drink plenty of cold water, and especially a drink in the morning and at least one at night. Wet mittens have been the cause of many colds. Every child should have two or three pairs for everyday use, and in snow ball season they shod d be exchanged as often as wet. One of the best ways to prevent colds and sore throats is to use an antiseptic wash and make a practise of gargling thoroughly every night and morning. There is nothing better to use for this purpose than a borax solution prepared by dissolving a heaping tablespoonful of powdered borax in a quart of hot water, then adding a little salt and keeping in a bottle ready for use. Use a little of this borax solution as a snuff night and morning to prevent colds in the head. This preparation will almost always stop a cold if one uses it in time. There seems to be a little doubts that colds result from a disease germ, and the borax solution cleans the air uassages of the nose. It is said that dust may convey the specific germ of cold, and it is wise when sweeping a room or driving out in the dust tr put a little vaseline in each nostril to keep the dust from finding its Aay to the air passages.

Last, but not least, is the subject of ventilation, as a lack of ventilation in living rooms will oftener induce a cold than too much fresh air. It is a good plan to air the sleeping rooms twice a day, early in the morning and late in the evening, and keep one window down at the top day and night.

FREE TO BOYS AND GIRLS

This beautiful Gold Finished Watch in Gents' and Ladies' size hunting case, stem wind and set, the case is engraved in a large variety of designs. New Vitality For Men

USE THE

Free Coupon

Vitality gives you the manly courage to protect those depending upon you, as portrayed in the picture. No matter what thoughtless action or early indiscretion may have sapped your strength, vitality restores it to you. It makes you over into a strong, vital, manly man, without an ache, pain or weakness. Vitality puts the real VIGOR OF YOUTH into your blood; no matter how nervous or debilitated you may be, it puts the sunshine of vigorous manhood into your life; I make you feel young and keep you feeling young, without the use of drugs, without the necessity of dieting, without one bit of change in your present mode of living, except, of course, dissipation must cease. Just lead a manly life and use my HEALTH BELT; everything else will come. My HEALTH BELT, worn at night, pours a great, soft stream of VITAL STRENGTH into your blood, nerves and organs during all the hours you sleep; in one night it takes the kink, pain or weakness out of your back, ere long friends will be saying: "How well you look," and you are answering: "Never felt better in my life!" Your eyes will sparkle with health; you will have that pleasing influence to fascinate and control which comes to all full-blooded, strong, vital, manly men. Thousands upon thousands are now using my Health Belt all over the world. With special attachments it cures rheumatism, kidney, bladder, stomach disorders, etc.

Let Me Send You This Book Free....

Here is my latest illustrated book: "Health In Nature," containing a fund of private information relating to weakness of men. All men, young or old, can read every word of this little publication with great profit. Sent to you in plain, sealed envelope by mail. The book is not not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely no obligation on your part to purchase. I simply want you tc read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

I'd Rather

I'd rather be a could be
If I cannot be an are,
For a could be is a may be,
With a chance of reaching par.

I'd rather be a has bt*h
Than a might have been, by far;
For a might be is a hasn't been,
But a has was once an are.

Also an are and am, is
But a was was all of these;
So I'd rather be a has been
Than a hasn't, if you please.

Fear

Four years ago a young man was ordered south by a northern physician. After several months chasing, in which the M. D.'s. rid him of all his worldly possessions, he was informed by a specialist that he would shuffle off within three months. He told the doctor that he had an opportunity to make $25,000 if he could live six months, and he was advised to get busy and get all he could in the shortest possible time, so that he codld leave a legacy to his wife and family.

The other day the doctor who gave this advice was visiting in a distant town, when he was approached by a 200-pound husky, who greeted him cordially. The doctor was at a disadvantage, as he did not recognize him. The Heavy recalled himself to the genial M. D., by reminding him of the lunger he had sent away four years before to earn $25,000. The doctor, though accustomed to surprises, was dumfounded, in beholding a man of fine physique and in perfect health.

This man was so busy making the $25,000 and the subsequent thousands that he forgot all about his disease and became a cure.

Here is an illustration of what total absence of fear will accomplish.

One-half of disease is in one's mind, the other half in the stomach.

A small ill, stimulated with proper fear, will finish the best.

One should not fear learning one's actual condition. Equipped with the proper knowledge, fight it, by occupying the mind with something cheerfully nourishing.—Fruit Magazine.

Quiet Refinement

There are some people who never need to conform to any established rule of society, to whom an easy and refined manner is second nature, and even though they may be placed in the most awkward of positions, yet they never seem disturbed.

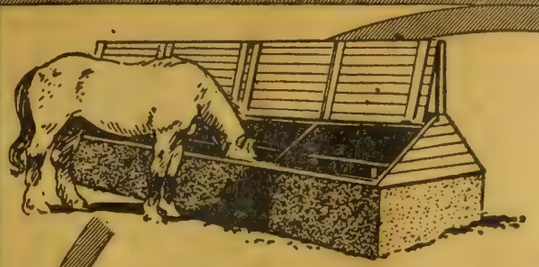
But most people are obliged to keep abreast of the times both by study and observation. To such I would say, if you are a housewife without servants, do not attempt a greater display upon the arrival of guests than your own family are in the habit of receiving, for only humiliation will reward your labors.

Sit down and chat with your friends and make them at home, and they will enjoy themselves much better than if you spent the greater part of your time in the kitchen. If you cannot serve a dinner with all its courses without weariness and nervousness, prepare a simple meal which has cost you but little labor and has left you free to entertain comfartably and easily.

Quiet refinement shows better breeding than great display. Be yourself and not an imitation of others.

A Precious Addition to the Flock

On December 26th, 1912, the stork called at Black Adder Farm, French Fort, P. E. I., and left a young shepherdess to grace the home of Mr. and Mrs. Geo. L. Boswall.



Ask us for this book it is free.

CONCRETE watering-troughs and feeding-floors help to keep your live-stock healthy.

HORSES and cattle watered from a concrete trough are less likely to contract disease. Concrete is sanitary, easily cleaned — does not rot or leak. Once built, a concrete watering-trough will last forever. You need never waste time "patching it up." Like all concrete improvements, its first cost is its final cost.

MANY diseases of hogs are directly due to feeding from the filthy, unwholesome mud of the barn-yard. This manner of feeding is also wasteful, because the grain is trampled into the ground, in such a condition that not even a hog will eat it. Concrete feeding-floors, with concrete swill-troughs are clean, sanitary. They keep hogs in better health and save feed.

WATERING-TROUGHS and feeding-floors are only two of scores of valuable, every-day improvements that may be made of concrete. All are fully described in our 160-page, illustrated book,

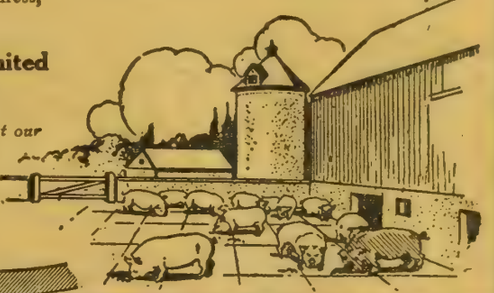
"WHAT THE FARMER CAN DO WITH CONCRETE"

sent free to any farmer upon request. This book has shown thousands of Canadian farmers how to make their farms more profitable. In asking for it, you do not place yourself under the slightest obligation to buy cement, or to do anything else for us. Simply ask for the book, by letter or post card, and it will be mailed at once. Address,

Publicity Manager
Canada Cement Company Limited
514-561 Herald Building, Montreal

REMEMBER, when in doubt, that our Farmers' Free Information Bureau will answer any questions on the use of concrete that you desire to ask. This service is free of charge.

Be sure that this label is on every bag.



Practical Dishwashing

A dessert spoonful of borax in a gallon of dishwater polishes the china so well, without harm to the hands. My best "dishrags" are made of half an old flour sack basted double, making a double soft cloth a foot square. A metal kettle scraper, consisting of an iron dishwasher, with the rings removed from the handle, is something I should not try to do without for common every-day dishwashing. A meat rind kept handy with which to go over all bottoms of kettles, pans, etc., that may be set next the blaze will make it easy to rub off the black with a paper, using a little soda. I keep papers in the kettle cupboard.

A cotton mit to wear while brushing off the range with a dusky cloth will save the hands, and once can then wash a cotton mit once a week instead of scrubbing a live "mit" twenty-one times a week.

The only thing we know as changeable as the weather these days is our young lady's disposition toward us.

"EASTLAKE" METALLIC SHINGLES FOR YOUR HOME ROOF

"EASTLAKE" METALLIC SHINGLES

Have been used for many years in preference to wooden shingles, and they are now rapidly replacing slate roofing. Why?

Because "EASTLAKE" METALLIC SHINGLES will not split, crack or wear out, neither can they warp or swell, and are not affected in any way by weather conditions.

They do not require heavy timbers to support them, thus lessen the weight of the roof to a considerable extent.

Barns and public buildings covered twenty-six years ago with "EASTLAKE" STEEL SHINGLES are as good as new to-day.

We will tell you the cost, if you send the measurements of barn, house or building to be roofed. *Let us send you our free booklet.*

Nova Scotia Farmers' Association in Annual Session.

(Continued from page 299!

Whereas, the Provincial Exhibition held annually at Halifax is not rearhing the majority of our farmers as it should and,

Whereas, we believe the expense attendant on transportation of live stock to and from the exhibition is one of the chief reasons why the ordinary farmer does not exhibit.

Therefore resolved, that the Nova Scotia Farmers' Association as at present convened in the town of Sydney respectfully request the Exhibition commission to take such steps as may seem best to them in order that all transportation charges on live stock and farm products may be fully paid believing this to be in the interest of the exhibition.

C. B. Blanchard,
H. W. Coombs.

* * * *

At the invitation of the Cross Fertilizer Co. many of the farmers took advantage of the opportunity to visit their up-to-date fertilizer factory.

At the close of Wednesday night's meeting The Cross Fertilizer Co. entertained the visiting delegates at a banquet at the Sydney Hotel. Plates were set for about two hundred guests and an enjoyable season was spent. The various toasts brought forth clever responses.

On Thursday morning the delegates visited North Sydney and Glace Bay and on Thursday afternoon the Dominion Iron & Steel Co. threw open their doors and the farmers were allowed to start at the raw products end of the plant and follow the various phases of its manufacture through to the finished products department, after which the delegates returned to their respective homes well pleased with the convention and with a better appreciation of the Island of Cape Breton.

The P. E. I. Short Courses.

The Prince Edward Island Department of Agriculture, ever alive to the best interests of the young men of the farm, this year inaugurated an agricultural short course, which has been successful beyond the most sanguine expectations of its promoters.

To cope with this undertaking, the Agricultural Hall was purchased and equipped with ample seating accommodation for the students and stalls and pens .or the horses, cattle, sheep, pigs and poultry used for class demonstration work.

The teaching staff consisted of Miss Dutcher and Miss James, on Domestic Science; Mr. Williams, Mr. Carey and Prof. W. S. Blair, on horticulture and apple packing; Mr. T. A. Benson and Pro.. J. P. Landry, on Poultry; Mr. Harvey Mitchell, on Dairying; Mr. J. A. Clark, Mr. S. J. Moore and Prof. Landells, on Cereal Husbandry; Messrs. R. Robertson, Reid, McRae and Telfer on Animal Husbandry and Dr. Pethick on the Diseases of Animals.

Prof. Ross, the capable secretary of the Island Agricultural Department, under the direction o Hon. Murdock McKinnon, the Commissioner, directed the whole course, and it must have done their hearts good to witness the zest with which the five hundred students, all ages, applied themselves to their respective studies.

The Department deserves every congratulation on the success of this their first short courses in agriculturw. We know the students returned to their respective homes with a new zeal in and .or their chosen profession.

"That's the slickest engine I ever saw"

So remarked an agent who has handled many different makes of gasoline engines in the last twenty years. "Why, he said "that special governor of yours would make any man want the

Renfrew-Standard

gasoline engine if he had no other reason for buying it."

The governor that the agent spoke so enthusiastically about is, we might say, one of the principal features of the Renfrew-Standard engine. It is undoubtedly the most efficient governor yet devised—immediately superior to the old fly wheel type. It controls the engine perfectly, allowing speed to be changed at will while engine is running, and automatically cutting off the supply of gasoline and electricity from batteries should engine exceed speed for which it is set. The simplicity and durability of this governor also makes the Renfrew-Standard engine especially adapted to withstand rough usage.

Other special features of the Renfrew-Standard are told about in our engine booklet. Send for a copy and learn what they are.

British Columbia Farmers Do Not Want Tubercular Cattle---No Sane Person Can Blame Them.

Editor Maritime Farmer.

In the December 27th issue of 'Canadian Farm,' there appeared an editorial criticism of the new Dominion regulation relating to the tuberculin testing of pure bred cattle received for shipment to British Columbia. The article appeared to be somew a misleading, and the writer apparently assumes that this is the first step taken to eradicate tuberculosis from the herds of British Columbia. A brief resume of work already done would not be amiss.

We beg to state that the regulation in question was not "recommended at the instigation of the veterinary profession of the Pacific Province. At the request of the farmers of the province, the Provincial Department of Agriculture began the work of eradicating bovine tuberculosis in 1909, and consistent efforts have been put forth ever since that date. The progress made has been even greater than was anticipated by the most sanguine, and it is expected that within a few months the disease will be practically eradicated. Diseased animals are slaughtered, and remuneration made to the owners to the extent of one half of the value of the animal. The maxium valuation, however, is limited to $75.00 in the case of a grade animal and $150.00 in the case of a pure bred.

Looking at the situation from all standpoints, we cannot believe that an unprejudiced person can see any injustice in the regulation. Surely the farmers and stockmen of British Columbia have the right to purchase healthy animals. Furthermore, we believe that, indirectly, the regulation protects the breeders in other provinces. Should a farmer of British Columbia purchase an expensive pure bred animal and shortly after have it condemned for tuberculosis, neither he nor his neighbors would be likely to purchase another from the same source.

We sincerely hope that in the very near future the regulation will be amended to include all animals shipped into British Columbia, except those brought in for immediate slaughter.

Quoting from the editorial, "This "regulation strikes at the very foun-"dation of this (inter-provincial) "trade, and if allowed to remain in "force will deal a death blow to live "stock trading between the different "provinces." Surely not. We do not believe it is fair to the live stock industry of Canada to insinuate that in any part of the Dominion there are not enough animals free from tuberculosis to supply the inter-provincial trade. We agree with the editor of "Canadian Farm" that the disease is contagious, and on this knowledge we base our belief that the restriction of the movement of diseased animals is desirable.

In addition to tuberculin testing, the Provincial Department of Agriculture has had in operation for several years, a very complete system of inspection of cattle stables. All premises are graded according to the existing sanitary conditions, and our inspectors give instructions as to how the sanitary conditions may be improved.

In conclusion, we would venture the opinion that, in addition to giving protection to the British Columbia farmer, the new regulation will stimulate trade between this province and the other provinces of the Dominion. Furthermore, it will lend encouragement to the breeders in other provinces who have been keeping their herds free from the disease, and, in general, should encourage the fight against bovine tuberculosis. We are convinced that the new regulation will be welcomed by all progressive cattle breeders as an important step in the right direction, and trust that what British Columbia has been able to accomplish may serve of value to the other provinces, indicating as it does, that bovine thberculosis may be successfully combated.— W. T. McDonald, Live Stock Commissioner.

Editor's Note.—We believe our Maritime Province stockmen are all in accord with the regulations passed by the Pacific province. It is a move in the right direction and one that must eventually come in force in all the provinces. No measure is too drastic in prevention of further infection and stamping out of the loathful disease.

The Basis of Oliver Success

THERE is one point about Oliver plows which gives them peculiar value in the plowing of Eastern Canadian fields. Each type of Oliver plow is manufactured for a certain section of the country, and can be depended upon to do good work under the conditions obtaining in that section. Before offering a type of plow for sale in any locality, Oliver plow manufacturers always send their expert plow designers to the place where the plows are to be used. These men study the conditions of climate and soil, learn the likes and dislikes of the people who are to use the plows, and when they return to the factory, they are able to superintend the manufacture of a plow which meets all the required conditions in the place where it is to be used.

Oliver Plows for Eastern Canada

The group of Oliver plows built for Eastern Canada includes walking plows of the famous Oliver No. 40 series, sulky plows, gang plows, and walking gang plows. Each of these is built for a certain purpose, and is the best plow obtainable for that particular purpose.

Back of the whole group is the fifty-seven years of successful plow experience of the Oliver Plow Works. This experience eliminates everything in the way of chance. You do not have to experiment with Oliver plows. Go to the I H C local agent and tell him what kind of plowing you have to do, and he will show you a plow built to do that kind of work and do it in the best possible manner. You can get catalogues and full information of the entire Oliver line from him, or, if you prefer, write the nearest branch house.

SEEDS THAT GROW GOOD CROPS

YOU can't afford to buy anything but the best in seeds, because what you buy in seeds largely determines what you'll reap in harvest. It's easy to raise big, plentiful crops from the seed of strong pedigreed strains, that's why so many people use

McDonald's Tested Seeds

When we say "Tested Seeds" we mean seeds that we know all about —seeds that have won the confidence of the most critical farmers and gardeners of Canada by their ability to yield big, bountiful crops,--seeds that produce crops true to name and description,--seeds that are all carefully tested before we send them out.

We want you to know all about our seeds, and about our way of doing business. Our 1913 Catalogue will give you lots of information. It's a handsome, helpful and finely illustrated book--and It's Free. Ask for it on a post card, or use the coupon.

Farmer's Butter Parchment Offer.

The Maritime Farmer's co-operative butter parchment offer is attracting much attention from those engaged in dairying. Hardly a day passes now but the mail brings one or more enquiries from those who are desirous of effecting a big saving in their butter parchment bills. By buying direct from the largest mill in Germany, the Maritime Farmer is able to save all superfluous profits and in turn offers its parchment at prices that have never been touched in the Maritime Provinces. The Farmer's offer brings to users of butter parchment, wholesale prices. The idea of co-operation is that users will band together and send us orders for not less than five reames (2,500 sheets), printed or plain. In either case a big saving is assured those who use parchment. The Maritime Farmer will appreciate an enquiry from you. It will be answered promptly. Already we have shipped out a lot of orders and buyers should provide for their wants early. The order should be accompanied by cash, as we prepay all freight charges to the nearest railway station.

The Maritime Farmer will send to any address, post paid, one of its useful stallion record books. Each book contains 100 forms for recording full description of mares, 100 receipt forms and 100 blank notes of hand. It is a perfect system of keeping an accurate record of all transactions during the season. Every groom should have one. It provides him with a complete bookkeeping outfit and the books fit comfortably into an inside pocket.

Dairymen of N. S. Hold Convention

To help advance the dairy industry in Nova Scotia, a convention of the cheese factory and creamery men was held in the Dairy Building, at the Agricultural College, Truro, on Tuesday, January 10th.

The meeting was called to order at 11 a. m., by W. A. McKay, Dairy Superintendent, who outlined the objects for having called the convention together, stating that up to the present 7time the factorymen had had no opportunity of meeting each other. In fact, they didn't know each other and that such a meeting as this was the only means of getting the men together for discussing the many problems which arise that are peculiar to creamery and cheese factory men, and trusted that the outcome of this meeting would be a more hearty co-operation among the men on whose shoulders largely rests the responsibility of increasing and encouraging the dairy work in the Province, and that free discussions would be taken part in on all the questions to be discussed.

C. W. MacDougall, Dairy Superintendent for New Brunswick, was appointed chairman of the Convention, and W. A. MacKay, secretary, and a resolution committee was appointed.

Prof. Cumming, Secretary of Agriculture, gave a short practical address of encouragement, expressing the willingness of the Department of Agriculture to assist the dairy industry in the province in any tangible and businesslike way possible.

The afternoon session was given over to short papers as follows: Marketing of Dairy Produce, F. E. Porter, Yarmouth; Co-operation between Factoryman and Patron, R. L. Rutherford, B. S. A., River Herbert; Winter Dairying and Its Advantages, R. B. McLennan.

Mr. G. A. McKenzie, of Scotsburn, being unable to be present, sent a valuable paper on Milk and Cream Testing.

These papers were all short and practical and were thoroughly discussed by all present after each one was read. These papers can be seen in this and succeeding copies of the Maritime Farmer.

The resolution committee submitted the following resolutions at the evening meeting which were read, discussed and passed unanimously.

Resolution No. 1. Whereas under the existing conditions for marketing the produce of the cheese factory and creameries in the Province of Nova Scotia are not as satisfactory to the factoryman as might be owing to the fact that to the average salesman it is difficult to ascertain the market price of butter and cheese, be it resolved that we, the Dairymen of Nova Scotia, here assembled, appoint a secretary to receive a weekly report every Saturday from the difierent cheese factories and creameries in the Province stating the average selling price for the week previous, F. O. B local station, and that the secretary take steps and means to get an accurate market report weekly from the markets of Montreal, Halifax and elsewhere, make a summary of the market prices and conditions and the average price of all factories from the last report and mail a statement of the above to each of the factories sending in weekly reports for the previous week on Monday, or as early in the week as possible, provided funds to carry on the work can be realized.

Resolution No. 2.—That we approve of holding a Dairy Herd Competition in the province during the year, according to the plan drafted and presented to us by W. A. MacKay.

Resolution No. 3.—That owing to the fact that the refrigerator car service in operation during the past season was not satisfactory to some of the factories, that we urge that the service be improved and extended to overcome the existing difficulties and that we request Mr. MacKay to take the matter up with the proper authorities.

Resolution No. 4.—That we recommend that we hold an annual meeting of the Dairymen and that the chairman appoint a committee of three to appoint time and place and make necessary preparations.

Resolution No. 5.—That we recommend that the committee appointed to prepare programme for next meeting, prepare plans, etc., for the organization of a Dairymen's Association.

The chairman appointed W. A. MacKay, F. E. Porter and R. L. Rutherford as a committee as provided in Resolution 4.

The convention was not large in number but a representative one of nearly all the creameries and cheese factories in the Province and what

ROYAL WIRE FENCE

Direct from Factory to Farm

The SARINA FENCE COMPANY, Limited

SARINA, ONTARIO.

WHEN we say direct from Factory to Farmer, it means a saving in dollars to our farmer customers, our method of selling means that we permit our customers to retain for themselves the commissions and profits which under usual methods of selling fence go to the agent or dealer. Efforts are made by these agents to have you believe that the difference in price of Royal fence and the prices of other makes is due to inferior quality. This is not the case; fifty thousand of the most prosperous farmers in Canada bought Royal fence during 1912. They are far too wise to buy wire fence for mere price reasons, they investigated and acted on their best judgment, and every one of them stand ready to tell you that Royal fence is made of the best all number 9 hard steel wire with the best galvanizing, and the most perfectly woven fence they ever used, and they had it delivered at their railroad station at from 5c to 10c per rod less than their dealer or agent could possibly sell them.

We know that our direct from factory to farm method is such a dollar saving proposition that we fearlessly publish our prices which include freight prepaid by us to any railroad station south of North Bay in old Ontario. Stop for one moment and think what price you were compelled to pay for fence before the Sarina Fence Company came into the field, and in recalling the old prices you would not need to draw very much upon your imagination to know where the price of fence would go if the Sarina Fence Company could be gotten rid of, it is therefore in the interests of every farmer not only to purchase Royal fence, but to use his influence with his neighbors as every customer helps us reduce our cost of manufacturing and enables us to keep our prices down. Our entire plant which has more capacity than any three other plants in Canada is running day and night, and our entire product is marketed to the farmer direct. We want your orders whether for one bale or a car load, and we sell all our fence with the guarantee, **your money back, and we pay freight both ways, if dissatisfied.**

The following are the prices at which we are selling fence. On account of the continued upward prices of the wire market, we do not guarantee them for any given period. We may be compelled to advance the prices again, but you may rest assured that we will not advance until compelled to, we therefore urge you to buy your fence as early as possible.

5-40-0 HORSE AND CATTLE FENCE, has 5 line wires 40 in. high, 9 stays to the rod, al lNo. 9. Hard Steel wire, spacing 10, 10, 10, 10. Weight per rod 6 1-2 lbs. Price per rod freight prepaid in Old Ontario..... **19c**

15-50P STOCK AND POULTRY FENCE, has 15 line wires, 51 in. high, 24 stays to the rod, top and bottom, No. 9 filling, No. 12 Hard Steel wire, spacing 1 7-8, 1 7-8, 1 7-8, 1 7-8, 2, 2, 2 1-2, 3, 4, 5, 5, 6, 6, 7. Weight 12 lbs. Price per rod freight prepaid in Old Ontario..... **37c**

FARM GATE 12x48 Freight paid with fence orders.... **$4.00**

FARM GATE 13x48 Freight paid with fence orders.... **$4.25**

FARM GATE 14x48 Freight paid with fence orders.... **$4.50**

WALK GATE 3 1-2x48 Freight paid with fence orders.. **$3.00**

STAPLES GALVANIZED 1 3-4. in per box of 25 lbs., freight paid with fence orders only..... **$0.75**

BARBED WIRE, GALVANIZED, Two point per spool of 80 rods. freight paid with fence orders..... **$2.25**

BRACE WIRE No. 9, Soft per coil 25 lbs. freight paid with fence orders..... **$0.85**

STRETCHER, All iron, top and bottom draw, very heavy tested chain, extra single wire Stretcher and splicer, the best stretcher made at any price, freight paid with fence orders..... **$7.50**

The above prices include freight prepaid by us to any railroad station (electric and boat lines not included) south of North Bay in old Ontario. We do not prepay freight on gates, stretchers, barb wire, brace wire or staples, except when ordered shipped with fence. All fence in 20, 30 and 40 rod rolls only.

Customers in New Ontario, Quebec, Maritime Provinces, and the North-West may deduct 2c. per rod from the above prices of fence, 25c. from the gates, stretcher and barb wire, 10c. from the brace wire, and 15c. from the staples; customer to pay his own freight from Sarina. Write us, tell us what style you want and we will tell you what your fence will cost you after paying your freight. We have never yet found a locality in the Dominion of Canada where our price with the freight added was not less by a good margin than your local dealer or agent will ask you.

The SARNIA FENCE COMPANY, Limited, Sarnia, Ont.

was lacking in numbers was made up in enthusiasm and optimism. Everyone present expressed himself freely on the different questions discussed, indicating that there is a bright future for factory dairying in Nova Scotia, that we had advantages here for dairying not equalled by any province in the Dominion, and that a determined united effort by all interested would mean that greater advances would be made in years to come than in the past and that the business would go along from year to year showing rapid increases.

We hope next year to report the organization of the Dairymen's Association of Nova Scotia and that it will be the means of bringing more hearty co-operation among the factories, offer encouragement for new factories to start in unoccupied territories and be the means of disseminating useful information among those interested in the different factories.

The N. S. A. C. 1913 Short Courses.

The Short Courses at the Nova Scotia Agricultural College held from Jan. 7th to the 17th have been the most successful of the whole series held in the history of the college. The attendance was 250 and in addition there was a special class of some fifty ladies who took a course in dairying, poultry, horticulture and domestic science.

In previous years, the short courses at Truro have included students from all of the Maritime Provinces. This year Prince Edward Island is holding its own short course and hence the usually large contingent from that Province did not go to Truro. The attendance at Truro was made up of some fifty-seven from New Brunswick, and the balance, with the exception of nine, from Nova Scotia. These nine hailed from the ancient colony of Newfoundland, where a great awakening in agriculture is taking place and where the desire for further knowledge along agricultural lines is very great.

The short courses at Truro differ from short courses held at some of the other institutions in that optional classes are held throughout the whole course and, while certain of the more important subjects, such as live stock judging, seed judging, and the general lectures on the care and management of live stock and the cultivation of the soil, are attended by all, yet opportunity is afforded for students to take special work in dairying, horticulture, or veterinary science and other departments as well. In this way as many as five or six different classes were being conducted at one time.

The special addition made to the short courses for this year was a course in road making, which consisted of some six lectures and demonstrations given by the Honorable Commissioner, the Hon. B. A. Armstrong, and the men of his Department, who are responsible for the carrying out of the road policy of the Province and also by B. W. McKenzie, Chief Engineer I. C. R., and Dr. L. I. Hewes, of the Road Division of the Department of Agriculture, Washington, D. C. This part of the course was exceptionally well received and must be regarded as a very valuable addition to the short course for farmers who are so dependent upon good roads.

As an evidence of the interest taken in this matter it is worth noting that the Morning Chronicle, one of the leading daily papers of Halifax, devoted from one to two columns in the front page of the paper to a description of the classes as carried on from day to day besides many of the other papers of the Province gave a publicity to the work at Truro such as it has never received before.

I H C Quality Shows in Service

WE could sell wagons for less money, but we don't care to sell that kind of wagon. We want your second order, and your third, and every order you give for a wagon. We can't be sure of getting those orders unless the first wagon you buy from us proves so satisfactory that you would not think of going anywhere else for the second. We have to tell you how good our wagons are to get your first order. After that, we expect the wagon itself to do the selling. I H C wagons

Petrolia Chatham

are made of selected, high-grade material throughout. Come with us to the works where these wagons are built, and see the tremendous sheds where the lumber is air-dried—seasoned out of doors—for three years or more before it is used. Do you know the difference between air-dried and kiln-dried wood? One process takes years of time, and leaves the fibres of the wood filled with and cemented together by the natural resinous residue of the sap. The other requires only a few days' time, drives out all the sap, resin and all, and leaves the wood brittle and weak. Air-drying produces elastic lumber, wagon parts that bend and give under loads and strains, but that come back to their original position when the strain is removed. Try for yourself some day the difference in breaking strain between an I H C wagon axle and a piece of kiln-dried wood a third larger. Then you will know why we can hardly keep up with orders.

The I H C local agent knows which wagon is best suited to your work, and will give you catalogues and full information about the wagon he sells. See him, or, if you prefer, write

The Bissell Out-Throw Disk Harrow

To settle all doubt about which is the BEST OUT-THROW DISK HARROW, we ask you to test the "Bissell" Out-Throw in a field competition with other Out-Throw Harrows.

The "Bissell" Out-Throw has many features that have made the name "Bissell' famous in connection with Disk Harrows. It has plates of the correct shape. One gang is set slightly ahead of the other. The gangs cannot crowd or bump together and cause the Harrow to rock when you come to hard soil—a new feature in Out-Throw Harrows. The hitch is well back, the draught is light and there is no neck weight.

The machine in actual use is our best advertisement. No need to send special travellers to sell the "Bissell." We put our name on every Harrow. If you would like to learn more about Disk Harrows, send to Dept. M for free booklet of both out-throw and in-throw styles. 72

Clover and Timothy Seed.

In November a conference was held with representatives of the wholesale seed trade at which samples were prepared and agreed upon to represent the minimum standard of general quality, apart from weed aged content, that would be recognized in official grading for Nos. 1 and 2 timothy, red clover, alsike and alfalfa seed during the season of 1912-13. On the whole the standards are some what lower than last season, with more spread between No. 1 and No. 2. The grade No. 1 American standard for timothy seed, which was recognized last season owing to the unusual circumstances, has been eliminated and the standard for No. 1 lowered to allow a larger proportion of hulled seed than last year; while grade No. 2 has been raised to prevent too wide a spread. With the clovers the standards for No. 1 are nearly as high as last season, but the No. 2 standards are considerably lower, especially for red clover. Samples of the standard grades have been distributed to the leading seed merchants.

Owing to the very light crop of red clover, alsike and alfalfa seen in Canada and the United States and its low average quality, it is exceedingly difficult for seed merchants to secure sufficient good Canadian and United States grown seed to meet their requirements. Canadian grown alsike and clover seed that will grade No. 1 is extremely scarce, while No. 1 Canadian alfalfa seed is almost non-existent and there is very little of the lower grades available. American grown Mammoth clover seed that will grade No. 1 is practically impossible to obtain in quantity and the supply of No. 2 is extremely limited. The fact that there is such a small amount of Canadian and United States grown clover seed has produced some unusual features of the trade that farmers and retail dealers would do well to consider. During the last few years the demand for No. 1 seed has greatly increased and now, when locally grown supplies cannot be had, the wholesale seedsmen are forced to depend largely on foreign seed for their No. 1 stocks. Red clover seed is being brought in from Chili and Europe to make up the No. 1 grade. The same applies to alfalfa seed in even a more marked degree, as practically all that grades No. 1 is being imported from the United States or Europe. The preponderance of foreign seed in the No. 1 grade this year is sufficient reason for the farmers and retail dealers to look more favorably on the lower grades, provided the seed is not graded down for weed seed content. It is well known that foreign grown seed is not so suitable for Canada as home-grown acclimatized seed; and it is quite possible that No. 2 Canadian grown seed would be really more valuable than No. 1 seed of foreign origin, provided that the weed seed content is the same.

When pure Canadian grown seed can be secured, although it grades No. 2 or even No. 3 on account of general quality, it would be advisable to use it, applying more to the acre to make up for the poor seed that will not grow. This is especially true of alfalfa, as with it the origin of the seed is of even greater importance than with red clover or alsike.

The scarcity of high grade clover seed is reflected by the number and character of the samples received at the seed laboratory. During December there was a decrease of about 40 p.c. in the number of samples of red clover and alsike received for test compared with the same month last year, and the proportion of No. 1 seed was much lower. During the month 697 samples were received at the Ottawa seed laboratory for purity and germination test. Those graded under the Seed Control Act standards were:

Although there was much less damage from frost to the cereal crop in the west last fall than a year ago, and there will probably be no difficulty in securing plenty of good seed in all districts, the work of seed testing in the Calgary laboratory has materially increased. During November and December 1,302 samples were received, compared with 91½ during the same period in the previous year. About 95 p.c. of the samples were for germination test.—Geo. H. Clark

SAVING THE FARMERS PROFITS

THE MISSION OF

THE "RENFREW" HANDY TWO WHEEL TRUCK SCALE

¶ Daily loss,--that's what inaccurate scales mean to the farmer. Loss on everything he sells by weight.

¶ Stop it Now. Let the Renfrew do your weighing, and get every cent of profit on your produce, ***that you should get.***

¶ "Renfrew" accuracy is guaranteed by the Canadian Government,--which means protection against loss through underweighing.

¶ The Renfrew weighs anything from one pound to 2000 pounds,--and you can wheel it to anything you want to weigh. Are You Interested?

From Grand Pre to Tantamar.

A. N. Griffin, Willow Glen Farm, New Minas, N. S. writes:—"I have sold Emily of Willow Glen, sweepstakes Shorthorn female at Halifax, and the bull calf, Willow Glen Hero, first prize bull, under one year at the Provincial Exhibition, Halifax, in 1912. Both went to New Brunswick. The heifer to Harold Etter, Westmorland Point, and the bull to the Penitentiary Farm, Dorchester.

WAS SO NERVOUS
COULD NOT EAT OR SLEEP.

There are many people who become worn, weak and miserable because their nerves become so unstrung they cannot sleep, and wherever there are ones troubled in this way they will find that Milburn's Heart and Nerve Pills will restore the deranged nerves to full life and activity.

They do this by their invigorating effect on the nerve centes, and will tone up the whole system to a perfect condition.

Mr. George McBeath, Round Hill, N.B., writes:—"I take the pleasure of writing to tell you the great benefit Milburn's Heart and Nerve Pills did for me. I was so nervous I could not eat or sleep, and could not even do my work, and I failed to a shadow. Finally I consented to try Milburn's Heart and Nerve Pills, and have only taken two boxes, and am able to work as well as ever, and can eat and sleep as well as ever I did. I can't praise your medicine too highly. My wife is taking them now for palpitation of the heart and is improving greatly."

The price of Milburn's Heart and Nerve Pills is 50 cents per box, 3 boxes for $1.25.

For sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

MAXWELL

HIGH SPEED CHAMPION WASHER

MAXWELL'S HIGH SPEED CHAMPION

is the Washer for a Woman

In the first place, Maxwell's "Champion" is the only washer that can be worked with a crank handle at the side as well as with the top lever. Just suit your own convenience.

Another Maxwell feature—Lever and Balance Wheel are so accurately adjusted and work up such speed that the washer runs along even when you have stopped working the lever. There's no doubt about Maxwell's "Champion" being the easiest running washer on the market.

Write for new illustrated booklet if your dealer does not handle Maxwell's "Champion" Washer.

POTATO GROWING COSTS CUT IN TWO

EUREKA PLANTER

Doubles your potato profits. Minimizes labor. Use a Eureka Potato Planter. Opens the furrow, drops seed accurately any distance or depth desired; puts on fertilizer if wanted, covers perfectly and marks for next row. Always plants uniform depth. Requires only one man. Driver sees seed drop. Made in three sizes, for 1 or 2 rows.

The Eureka Mulcher and Seeder

A mulcher, smoothing harrow, cultivator, weeder and seeder all combined. Forms dust mulch and conserves moisture. Three sizes, 8, 10 and 12 ft. Lever with pressure spring regulates depth of cut. Pulverizes the soil. Levels the ground. Teeth are flat and can be removed to cultivate in rows. The driver rides.

Seeding boxes can be easily attached to sow grass seed, alfalfa, oats, etc. Adjusts for seeding various quantities. Teeth cover seed thoroughly, either shallow or deep. Economical in price.

Send for free catalogue today.

FARMER ADS BRING RESULTS

Hallams Weekly Market Report

BEEF HIDES are in good demand for the better grades, and we can look for a lower range of prices as the season advances, and the quality becomes poorer. City Butcher Hides green, flat, 13c per lb. Inspected hides No. 1, 14c; No. 2, 13c; No 3 12c. Country Hides flat cured, 13½c to 14c; part cured, 12½c to 13½c. Green, 12c to 12½c.

CALFSKINS continue dull, stocks are accumulating the tanners are waiting for a lower range of prices. City skins, green flat, 15c. Country, green flat, 15c; part cured, 16c; cured, 17c.

HORSE HIDES are staple, with the supply about sufficient to supply the demand. City take off, $3.50 to $4.00 Country take off, No. 1, $3.50 to $4.00 No. 2, $2.50 to $3.50.

SHEEPSKINS are steady with offerings taken up at current prices. City take off according to size $1.00 to $1.50. Country, 75c to $1.50.

WOOL is in good demand with small stocks in the hands of dealers, offerings being takes at full quotations. Washed combing fleece, 21c to 23c. clothing fleece, 25c to 26c; rejects, 17c to 18c; unwashed fleece combing, 13½c to 14c; clothing 15½c to 16½c.

TALLOW market unchanged at current urices. City rendered solid, in barrels, 6½c to 6¾c; country stock, solid in barrels, No. 1, 6¼c to 6½c; No. 2, 5c to 6c; Cake No. 1, 7c to 7½c; No. 2, 6c to 6¾c.

HORSE HAIR. Farmer or pedlar, fair stock, 28c. to 40c.

OLD RUBBERS, ETC., are in moderate demand, deliveries about sufficient to supply present needs at unchanged prices. Boots and shoes, 6c to 8½c; auto tires, 6c to 8c; bicycle tires, 3½c to 4½c; lead, deavy, 3½c to 4c; tea lead, 3c to 3½c, brass, heavy 9c to 10c; light, 7c to 8c; Copper, heavy, 10c to 11c; light, 7c to 9c; Zinc, 2¾c to 4½c.

'Some Pigs in Lunenburg County.

Editor Maritime Farmer:

While looking over a recent issu? of your paper, The Maritime Farmer, I noticed an article written by Harry Alliston re the large pigs he raised, and wanting to know if any reader had any to beat them.

John Best, Blockhouse, Lunenburg Co., N. S., killed his pig when 7 months and 20 days old and it tipped the scales at 440 lbs.

Mr. William Mills killed his pig when 7 months old, it weighed 404 pounds.

A neighbor of mine, Mr. Isaac Zwicker, killed his pig when 15 months old and it tipped the scales at 652 pounds.

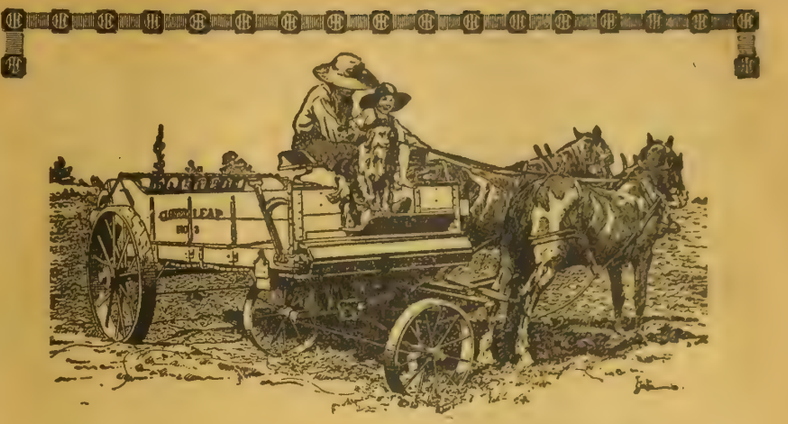
Mr. Albert Desmond killed one 17 months old and it weighed 672 lbs. These were raised in Lunenburg Co., N. S., and I don't think you can find any to beat them.—A member of the Lunenburg Co. Farmers' Association.

An Open Challenge

Editor Maritime Farmer:

W. M. McAdam, Killam's Mills, grew a little patch of Kangaroo Swede turnips, twenty-six short drills, during the season of 1912, from one-half pound of seed sown on June 15th. He thinned them carefully and cultivated them twice. He harvested sixty-seven barrels of fine table turnips. The two largest turnips weighed twelve and thirteen pounds respectively.

Can any one in Westmorland Co. beat this record? Reader, West. Co., N. B.



Land Value Almost Doubled

IT is no longer an unusual thing for us to get reports from farmers who have been using manure spreaders properly and consistently for periods ranging from three to five years, to the effect that the land on which the manure spreaders have been used is regularly raising so much more produce that the value of the land is almost doubled.

"The beauty of it is," writes one Ontario farmer, "that the increased fertility seems to be permanent. Dry weather has less bad effect on our crops now than it used to, the soil is much more easily worked, making the day's work easier both for the horses and for the men, it is less trouble to raise better crops, and we are a good deal surer of good returns since our soil was built up by the use of an

I H C Manure Spreader

I H C manure spreaders, **Corn King** or **Cloverleaf**, are made in various styles and sizes to meet any and all conditions. There are wide, medium and narrow machines, all of guaranteed capacity; return and endless aprons; in short, a spreader built to meet your conditions and made to spread manure, straw, lime, or ashes as required.

I H C spreaders will spread manure evenly on the level, going up hill or down. The wheel rims are wide and are equipped with Z-shaped lugs, which provide ample tractive power without jarring the machines excessively. The apron moves on large rollers. The beater drive is positive, but the chain wears only one side. The I H C agent will show you the most effective machine for your work. Ask to see an I H C manure spreader. You can get catalogues from him, or, if you prefer, write the nearest branch house.

The Life of the Cow.

Professor C. H. Eckles, of the Missouri Experiment station, says that probably the majority of dairy cattle are rejected from the herd on account of failure to breed, or from udder trouble, before the effect of advancing years can be obsesved to any marked extent. It is a fact often observed that a cow may make her best record when ten or eleven years old, although as a rule she does her best rather earlier. If a dairy cow continues to breed, she usually shows no marked decline until at least twelve years old. Occasionally a cow continues to breed until she is sixteen or eighteen years old. While it is not entirely safe to judge the future milk production of a cow from her two-year-old record, it is reasonably safe to judge the richness of her milk. A dairy cow on the average as a two-year-old may be expected to produce about 70 per cent.; as a three-year-old around 80 per cent.; as a four-year-old about 90 per cent of the milk and butterfat she will produce under the same treatment when mature. The richness of the milk remains practically constant from year to year, except that after the third milking period there is a slow gradual decline with advancing years.

Farming as an Occupation.

is the tille of an interesting new book by Rev. James Crisp, Dorchester, N. B. The author gives a vivid description as a province in which to make a home. The book opens up a way in which the native as well as the foreign born citizens of New Brunswick may be in a better position financially, socially and morally.

Mr. Crist expresses very strongly the opinion that N. B. offers splendid opportunities to men of limited resources, and is convinced that many people in the Old Country would better their conditions materially if they came out here and located on the land. The book is well worth many times its price, 25 cents.

Animal Food for the Fowls.

During the fall and winter it is necessary to furnish the fowls animal food in some form. The best egg yield is not possible unless it is included in the ration. Poultrymen usually supply this element in the form of beef or fish scrap.

In most localities animal food can be obtained at home at a low cost. Beef cracklings, found at all slaughtering houses make an ideal poultry food, and are identified with the scrap sold by dealers.

Fresh bone also makes a good poultry food, and is, perhaps, the cheapest as well as the best egg-making food. The soft bones from fresh-killed animals, vertebrae, ribs, etc, are easily reduced to chicken feed with a good bone cutter or even sharp hatchet. In feeding either the cracklings or bone about one pound should be fed to 10 pounds of whole and ground grain.—T. Z. Richey, Perry Co., Pa.

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking,

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally;

E. L. MORRIS, Manager 1900 Washer Co'p'y.

357 Yonge Street, Toronto, Can.

Potato Growing Contest for Boys.

A movement that promises to have important results was set on foot last year by a small Committee, consisting of Mr. R. B. Whyte of Ottawa (Chairman), Mr. W. D. Jackson, Agricultural representatives for Carleton County of the Ontario Department of Agriculture, Mr. W. T. Macoun, Horticulturist of the Central Experimental Farm and Mr. L. H. Newman, Secretary of the Seed Growers' Association, who also acted as secretary for the competition. By Mr. Whyte's generosity substantial prizes were offered for a potato growing contest open to boys in Carleton County, Ontario, of between 12 and 18 years of age, who live on farms of not less than 50 acres in extent. With certain exceptions in the case of the younger boys all the work was to be done by the competitors themselves. Each competitor had to keep an accurate account of expenses and profits, a record of date of planting, variety planted, etc., and he was encouraged to send in a short history of the work for which credit was given in the making of the awards. Each plot occupied one-tenth of an acre, and instructions were given to the boys by Mr. Jackson, who also inspected and reported upon the field work. The scale of charges allowed to be charged in the account by each competitor was $3 for rent, 10c. per hour for each horse, 20c. per hour for each man, $1 per ton for stable manure, seed at the market price per bushel, and spraying material at current prices. The prizes were awarded upon the following scale of points: (a) thoroughness of field culture 100; (b) report of yield 100; (c) award of judge on exhibit of one bushel sent to Richmond Fair 100; (d) written report of competition 100. Total 400.

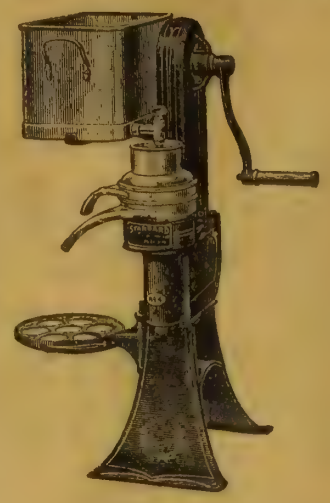
Entries were made by 35 boys, of whom 22 carried out the work in all its details. Amongst the first six prize winners the total cost per acre ranged from $60 to $135.50 and the net profit per acre from $102.20 to $179.00, the last named sum being the profit gained by the second prize winner. The average yield of the first six prize winners was 388 bushels per acre, that of the first 13 competitors 343 bushels and that of all competitors 285; so that even in the case of the less fortunate competitors the average yield obtained was more than double the average of the province of Ontario in 1912, viz. 134 bushels, as estimated by the Ontario Department of Agriculture.

The prizes were presented to the successful candidates at a public meeting held at Ottawa on November 30. On this occasion Dr. J. W. Robertson delivered an address in the course of which he said that the contest pointed the way for extending and enlarging the practical education of farm boys who have left school. It became an educational farming project, combining productive work and systematic study. It trained the boys into observing, thinking, learning, judging, doing and recording. Out of this came most creditable results in the products. The "left-overs" in material things were clean land, good potatoes, and very handsome profits. The "left-overs"—the evidence and substance of real culture in the boys themselves—were increased intelligence, enlarged activity and quickened capacity and desire to work with others for a good purpose. In brief the contest had its first product in the development of knowledge, power and good will.

It is proposed to repeat the prizes in 1913, and it is hoped that ultimately a potato growers' association or club for the county of Carleton will be organized.

The turnip growing competition in Cumberland and Colchester counties,

For These Reasons



FREE

Write for the Standard Booklet, giving a full description of "The World's Greatest Separator," also folder entitled "Skimming Results."

TO tell all the reasons why we believe your choice of a cream separator should be the Standard would be impossible in this space, but here are four. **FIRST**--Because the

Standard

cream separator under ordinary conditions skims to .01 per cent. or less. It loses but one-tenth of a pound of butter fat in 1000 pounds of milk skimmed. The ordinary separator loses a full pound. **SECOND**--Because the Standard has a wide open bowl, and no cream or milk tubes to clog up. Everything easy to clean. **THIRD**--Because the supply can is more than a foot lower than on ordinary machines. No high or awkward lifting to do with the Staudard. **FOURTH**--Because the Standard has a self-oiling system and lubricates its working parts automatically all the time it is running.

The Standard will save more time and labor, and make more money for you, than any other cream separator. Try one and let the machine prove these facts.

15 MINUTES To The Acre

Does the work with the Horse Power Spramotor, and does it well. Four rows, three nozzles to a row, adjustable up to 40 inch rows. *Nozzles will not clog.* 12 gal. air tank, automatic and hand-controlled. Guaranteed pressure of 125 ponnds with all 12 nozzles working. Agitator, clean-out pressure relief into tank, nozzle protector under driver's seat. For 1 or 2 horses. Adjustable for vineyards, row crops or orchards. Write for free treatise on crop diseases.

Shall I Buy a

SPRAMOTOR

or an ordinary spraying outfit?

That's *the* question— Your decision should be *determined* by *what* you expect the machine to do and *how long* you expect it to do it.

If—you want a *durable* hand machine for the purpose of destroying weeds—spraying orchards, potatoes and row crops—one that you can also paint with—you want a

Hand Spramotor

If you want a *durable* H. P. machine to do all these things besides spraying grain and doing the white-washing you want a

H. P. Spramotor

If you want a *durable* gasoline machine to do all these things in a *bigger* way but *mainly for orchard work* and *white-washing* you want the

Model "C" Spramotor

The SPRAMOTOR in every class, has *demonstrated* its *superiority* to all other spraying outfits and *there's one built specificially* for your needs. Prices range from $6.00 to $350.

N. B.- When you buy a SPRAMOTOR you make a *permanent investment* because every machine bearing the name is built to endure.

SPRAMOTOR CO., 1530 King St. E., London, Can.

N. S., last year was along the same lines. We trust this good work may be an incentive for other good thinking citizens to come forward with contributions for many contests of this kind.

The Cause of the Destruction of the Canadain Tamarack

The almost total destruction of the tamarack, or larch, which took place throughout eastern Canada almost thirty years ago was caused by an insect, the Larch Sawfly. It appeared again about eight years ago and in its spread westward it is repeating its former devastation on the younger tamaracks.

To all who are interested in our forests the appearance of a comprehensive account of this insect entitled "The Large Larch Sawfly, with an account of its Parasites, other Natural Enemies and Means of Control," by the Dominion Entomologist, Dr. C. Gordon Hewitt, will be welcome. This has been published by the Dominion Department of Agriculture as Entomological Bulletin No 5 and Bulletin No. 10, of the second series of the Experimental Farms Bulletins, and may be had free, on application to the Publications Branch, Department of Agriculture, Ottawa.

Dr. Hewitt has studied the life history, habits and means of control of this injurious Sawfly, both in England and North America. In England it was found that the natural enemies, especially parasitic insects, effectively gained control of outbreak of the insect. Other natural enemies were mice and birds and a system of bird encouragement was started on a large scale. The devastating spread of the Sawfly in North America was due to the comparative absence of the natural means of control. Several important species of parasites new to science were discovered and have been studied and described. To increase the number of natural enemies of the Sawfly, attempts are being made to introduce and establish in Canada, parasites which were discovered in England and which appeared to control the pest there. An account of these interesting experiments and of the methods devised to encourage the birds and other means of control are described in this bulletin, which consists of forty-two pages and contains twenty-six figures, including a colored plate. The publication of this bulletin is indicative of the attention which the Division of Entomology is now devoting to the insect pests of our forests which are responsible for incalculable loss each year.

Mr. and Mrs. Geo. H. Pedlar Present New Wing to Oshawa Hospital

At the Board Meeting of Oshawa, (Ont.) Hospital, on Jan. 14, a Deputation, consisting of Drs. Kaiser, McKay and Carmichael, waited upon the board with an offer of $10,000 from Mr. and Mrsf George H. Pedlar, of Pedlar shingle fame, to be used in the construction of a new surgical wing to the Oshawa Hospital, in connection with the proposed addition to the present building.

This handsome donation came as a genuine surprise, and was immediately accepted with the heartfelt thanks of the Board. The surgical wing was presented by Mr. and Mrs. Pedlar as a memorial to their son, the late George H. Pedlar, Jr., after consultation through Dr. Kaiser with the other doctors of the town, as to the type of equipment most urgently needed.

R. of P. Guernseys

Editor Maritime Farmer:

The following Guernsey cows have recently qualified in the Canadian Record of Performance:

Mature Class—age 5 years at commencement of test.—Flora of Brookside—36, R. of P. G. Bred and owned by D. G. MacKay & Son, Heath Bell, N. S. Total production, 8107 lbs. of milk, 418.257 lbs. butter fat.

Four-year-old Class—Berwick Queen Bud—351, R. of P. No. 8. Bred and owned by John N. Chute, Berwick, N. S. Total production—9195 lbs. milk, 421.163 lbs. of butter fat.

Two year old Class—Heiress Daisy —318—R. of P. No. 10.—Bred and owned by D. G. MacKay & Son, of Heath Bell, N. S. Total production 6318.5 lbs. milk, 282.586 lbs. butter fat.—H. W. Corning, Secy., Canadian Guernsey Association.

BEAVER FLOUR

WHEN IT COMES RIGHT DOWN TO QUALITY BLENDED FLOUR MAKES THE BEST BREAD IN THE WORLD

"BEAVER" FLOUR is made of choicest Ontario Fall Wheat, with enough Manitoba wheat to add "strength" to the dough. This special blend gives the flavor, food value, baking qualities, strength and quantity, as no other one flour can.

When it comes right down to quality and quantity, "Beaver" Flour makes better bread and pastry—and more bread and pastry — than any western wheat flour.

You have only to use "Beaver" Flour once to prove all this to your complete satisfaction.

McGILL ST., MONTREAL. 27

The Fur Industry of Canada.

Canada has had a fur industry since the beginning of history. The pursuit was born of necessity, but is also natural as well as acquired.

The lure of the chase, of the woods and the wooded wastes; of the mountain and the flood is the birthright of man, having its transmission in the blood of humanity since our forefathers battled for their existence when the cities of our country were the wild places of an earlier century, and man procured his daily rations, by artifice of the hunt, by matching his cunning against the cunning of the bird, beast and water-creature of the forest and the rapid.

The trapping of animals has, however, lost none of its charm since the days of the pioneer, but the incentive of the occupation has changed from necessity to sport.

Yet in the trapping and luring of wild animals, not so much for the food as for the fur, Canadian wilds have, since the white man learned the Indian trapper's act; provided an occupation very lucrative for those who have followed its pursuit, and though the days of the explorer have almost passed away; though he ceases to drive his canoe along streams unknown, dotted here and there by dangerous rapids and falls; ceases to portage through trackless forest, for the fur-bearing animals, which were once so numerous in Canada, there is still in this age of cities and civilization, a profitable living in fur hunting.

FUR ANIMALS PLENTIFUL

Strange as it may seem the catch of furs to-day is greater and of more value than when this country was a wilderness. For whilst the professional trapper has almost disappeared the bulk of furs being caught by the ambitious farmer and his son, in order to add a substantial sum to their income, the means of trapping are now so numerous that the annual catch has become greater to-day than heretofore.

Much has been heard of late concerning the fox farming industry, and doubtless many are ambitious to engage in that pursuit. Breeding stock is, however, very expensive, and only men of means are able to pursue their desires in this respect. The aspirant to trapper's honors or the procuration of furs, can, however, find all he needs in the way of experience around his own neighborhood, and will find that a winter spent in the woods will help him to add handsomely to his finances and provide ample sport in a good season.

DEMAND IN CANADA.

There never was a better outlet for the winter catch than exists in Canada to-day. Demand for all classes of furs was never better. Skunk furs are more popular in Canada than heretofore, and muskrat are finding new uses year by year. This season the highest prices for many years have been procured, despite the fact that there has been an unusually large catch of skunk and muskrat owing to the hard winter of 1911. Every thing was frozen up and this prevented a large catch at that time and allowed of more prolific and extensive breeding, giving a larger crop for the present year.

WHERE TO TRAP.

In reference to trapping Hallam's guide says:

"It is not necessary to wait until the trapping season opens in order to locate places to set the traps, but in passing through the woods look carefully for signs of animals; here you may find a bunch of feathers, mute remains of a woodland tragedy; here an ear of corn or other vegetable partly eaten; here a den tree with its bark scratched by climbing raccoons; here a hole in the ground with tracks in the soil and hair on the side of the entrance, proclaiming the home of the skunk; here trails made by passing animals and their droppings, which proclaim their presence while on sand bars and in the mud along the streams and lakes you find tracks of mink, muskrat, raccoon and other animals, that seek their food in and near the water. All these signs should be carefully observed and their location noted for the purpose of trapping later in the season. They tell their tales to the experienced trapper, and if the amateur is to make a success of trapping, he must be of an observing disposition, study out the cause of these signs, and learn to read the forest, so that he may successfully match his reason against the instinct and natural wariness of the various animals.

If you trap in your neighborhood, you should go over the ground in the late summer and early fall and prepare places to set your traps, so that the animals will become accustomed to the change before the season opens, by placing a log, stump or chunks in a dtich or small stream in such a manner that there is left only a small passageway for the animal at one side, by digging a trench across a neck of land, running into a stream, so that the water will pass through about one inch deep, and covering it over with grass or chunks, and the passing mink cannot resist the temptation to pass through by making cubbies in the woods, and by scattering bait at different places and observing on your next trip whether it has been taken, thus learning what animals, if any, are in that particular locality; in this manner you become thoroughly acquainted with your grounds, and when the season opens for trapping, you know the best places to set your traps.

It is well to remember that few fur-bearing animals travel to any extent in the day-time, and that many a fine mink has been caught in localities where the "oldest inhabitant" has declared he has not seen one for twenty years.

The successful trapper is one who is observing, uses good judgment and is careful to make his set properly, using that set best adapted to the circumstances of the case and the animal he desires to capture, and in this

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUSTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT T H WONDRFUL BURN R DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

SUSSEX, N. B.

We do not sell these burners but each subscriber may get two beside one we furnish free by sending 35 cents for each additional one wanted.

anner secures furs which if properly andled brings him a very substan-al return for the time spent besides fording him the pleasure and ex-tement of a life lived in the open."

HINTS TO HUNTERS.

Don't use bright traps, but boil em in water with pine, spruce, hem-ck or balsam boughs or walnut ulls; after boiling half an hour the ap becomes coated with a paint-ke substance. Take the traps out, ang in the sun to dry. The coat-g will get hard, and will keep them om rusting, and kill the smell of on, rust, etc.

Don't commence trapping too early. ne prime skin frequently brings more oney than two or more caught early the season.

From February to March is the ating season for mink. Save every ink sack, squeeze contents into a ottle, with fish oil, as it is a lure to oth sexes; to bait, dip a stick in e bottle and place in the hole be-ond the trap.

An excellent way to kill either a ink or a weasel is to stun with a club, and then ush in the ribs. When this is one there will be no blood clot on e pelt.

When setting traps, do not disturb e surroundings more than is absol-tely necessary, and leave them look-g as natural as possible; while me animals are not suspicious oth-rs are, and if care is used, you will equently catch some other animal your trap than the one expected.

Use gloves smeared with blood or ated with beeswax when handling nd setting your traps, so as to a-oid as much as possible leaving hu-an scent. Gloves used for trapping hould be used for nothing else. Some rappers do not think this necessary, ut the majority advise it, and a lit-le care may materially increase your atch.

Do not spit near your trap, or you ill leave human scent. Never put, eroseoe oil on your traps, as ani-nals will not go near them while the dor remains.

Never take your dog with you on he trap line, as mink and some oth-r animals can scent a dog for days fterwards.

Whenever possible, splash water ver your set and the surroundings, s water washes away human scent.

Before setting your trap, test it to ee that it is in good working order, nd unless you can put it in good or-er, throw it away. Traps are heaper than furs, and it is usually he good pelt that gets away from he defective trap.

To witen traps for snow sets, boil ime in water, and immerse the trap or a short time, and it will come ut perfectly white.

Note.—The writer of this article is ndebted to Mr. John Hallam, fur lealer, of Toronto, for a great deal f the information in this article. At a later date, the different kinds of fur earing animals will be discussed, ith methods peculiarly adapted to he trapping of each breed.

FLORICULTURE.

A Correspondent writes:—Do ordinary house plants, such as Geraniums, Ivies, Rubber Plants, etc., require any plant food after being brought into the house from the garden? What manure should be used on them? The said plants are potted in soil poor in quality. What manure should be used in the garden and should it be applied in the spring?

If Geraniums have been planted in the ground and dug up and potted I do not think they will require any fertilizer until spring. If, however, they have been grown in pots all summer, they would certainly be benefited by the application of liquid cow manure, once a week. The same would apply to Ivies. I cannot understand a Rubber Plant being grown in the garden as I hardly think it would stand out-of-doors. As a general rule, very little fertilizer is required on either Rubber Plants or Palms, at this season of the year, as they are usually inclined to be semi-dormant. However, if a plant is much potbound a little manure water once in a fortnight would probably do no harm; and if plant has been out of doors all summer, it is probably sick from the effects and should not be stimulated until a healthy growth starts again. In regard to fertilizers to be used on the plants, I would say that I have always found that fresh made liquid manure gave good results on every occasion. I have never seen anything that is better adapted for amateur use. About two quarts to a pail of water is a good porportion to use. It should be kept well stirred while using. Many of the prepared plant foods are very good but should be very carefully applied. Well rotted manure should be used in the garden if it can possibly be obtained. The contents of a hot-bed makes excellent material and there is not much danger of weed seeds being contained in it. I always apply all fertilizer to garden in the spring from the standpoint of economy. If the soil be light much of the value is wasted during winter. If the soil is heavy it probably would not make much difference.

Be careful that your tender house plants are not exposed to drafts from open doors or windows. Proximity to a hall door is not a good place for plants at this season of the year, for even if the plant be not actually frozen, yet it would receive a chill that would, possibly, in time, prove fatal.

Prevention of Internal Derangement.

The value of a dose of aperient medicine given in time cannot be sufficiently estimated until it has been tried. Many serious cases of internal stoppage could be entirely avoided—and lives of fowls saved—if this preventive measure was adopted.

Fowls often stand about with their feathers ruffled up round their heads, and if their ailment is neglected they frequently die from the cause of this apparent derangement. Unless fowls derive nokrishment from their food soon after it has been consumed by them, they very soon show signs of weakness following the loss of that nourishment so essential to their well being, and, the first few feeds having been consumed and not assimilated, their intestines become filled with a mass of undigested food, which, unless removed by aperient medicine, causes the bird's death eventually.

One of the secrets of successful poultry-keeping is to feed the birds so that they obtain all the nourishment possible from their food, and this is accomplished by giving them an ample supply of grit, which is really hard and sharp, and crushed (or broken) flints answers both requirements more perfectly than any other material, as it lasts longer and does its work more thoroughly than any other.

A supply of grit should be kept in a trough in the run for the birds to help themselves to, and once a week a teaspoonful for each bird should be added to the soft food. This usually prevents the posibility of internal stoppage, but any slight derangement in this direction should be treated by giving each hen a teaspoonful of warmed castor oil, followed by one of warmed salad oil two hours afterwards, and the male birds should have rather more than these quantities.

The bottles containing the oils should be placed in a basin of hot water after removing the corks, so that the contents may become quite liquid, otherwise there is a risk of choking the birds when administering the castor oil, as this is frequently very thick and apt to cover the wind pipe, and when the bird breathes to pass down the wrong channel, causing suffocation.

Poultry Notes.

A successful poultry man says that he keeps the combs of his poultry brightened by putting corn in a bucket and dampening with water, and then stirring in about a quarter of powered air-slaked lime. He feeds this twice a week as an evening meal.

Fattening poultry on food mixed or moistened with skim milk instead of water, produces whiter flesh and a superior flavor. Skim milk alone is a highly nitrogenouus food; the carbohydrates have been removed in the butter, so that it is not a complete diet for any animal. The fat of the cream, however, can be cheaply substituted with corn or cornmeal.

BABY'S OWN SOAP

Prescott Blanchard, Truro, N. S.

Free to Stock and Poultry Raisers

We will send absolutely free, for the asking, postpaid, one of our large sixty-four page books, with insert, on the common diseases of stock and poultry. Tells how to feed all kinds of heavy and light horses, colts and mares, milch cows, calves and fattening steers; also, how to keep and feed poultry so that they will lay as well in winter as summer. No farmer should be without it.

NOW is the time to use Royal Purple Stock Specific. At a cost of only two-thirds of a cent per day per animal, it will increase it 25 per cent. in value. It permanently cured Bots, Colic, Worms, Skin Diseases and Debility. Restores run-down animals to plumpness and vigor. It will increase the milk yield three to five pounds per cow per day and make the milk richer.

Royal Purple is not a stock food. There is no filler used in its manufacture, and we import from Europe all the seeds, herbs, barks, etc., and grind them on our own premises. Therefore, we can guarantee it to you as being absolutely pure. We do not use cheap filler to make up a large package. We give you the best condition powder ever put on the market in a concentrated form.

A tablespoon levelled off, once a day, is sufficient for a full-grown animal. It prvents disease, keeps your animals in perfect health, and is absolutely harmless. It makes six-weeks-old calves as large as ordinary calves at ten weeks. You can develop six pigs ready for market in just one month's less time than you can possibly do without it, at a cost of only $1.50, saving you a month's work and food.

A 50c. package will last a horse 70 days. A $1.50 pail or air-tight tin, containing four times as much as a 50c. package, will last an animal 280 days.

If you have never used it, try it on the poorest animal you have on your place, and watch results. If it does not produce better results than anything you have ever used, or give you satisfaction, we will refund your money.

Toledo, Ont., July 1, 1910.
W. A. Jenkins Mfg. Co., London, Canada.

Gentlemen,—I have used a part of a package of your "Royal Purple Stock Specific." I fed it to one cow according to directions. She gained six pounds of milk while using part of a package. The rest of my herd reduced in milk while this one gained. I consider it has no equal.

T. G. BELLAMY.

Bondhead, Ont., Aug. 31, 1912.
The W. A. Jenkins Mfg. Co., London, Ont.

Gentlemen,—After experimenting with a great many stock foods, I was about convinced that there was very little virtue in any of it, but your dealer insisted on me trying Royal Purple Stock Specific, saying it was different from all others. I have since used a great lot of it, as I keep from ten to twenty horses and about the same of cattle. This Specific, in my opinion, is certainly in a class by itself as a conditioner, and is the best I have ever used.

GEORGE MAPES.

Clear Creek, Ont., Sept. 19, 1912.
W. A. Jenkins Mfg. Co., London, Ont.

Dear Sirs,—Your "Royal Purple" Stock Specific is the best stock conditioner I have ever had in my stables, and am never without it. I had a brood sow that had milk fever very bad. Your "Royal Purple" saved her life. Put her on her feet in three days. I had three calves last spring that got scouring very badly. Could not get it stopped until I used "Royal Purple." It did the work O.K.

Yours truly, H. B. MOULTON.

Saskatoon, Sask., Sept. 20th.
The W. A. Jenkins Mfg. Co., London, Canada.

Gentlemen,—Some months ago we bought some of your Royal Purple Stock Specific from Mr. Vogan here. We have been using it ever since, and we find it the best conditioner for driving horses we have ever tried.

H. F. McCALLUM, "The Palace Livery."

Scott, Sask., May 22nd, 1911.
The W. A. Jenkins Mfg. Co., London, Ont.

Dear Sirs,—Do you want a man to represent your Royal Purple goods in this district. I am from Ontario, and have fed your Stock Specific—got it from Mr. J. Corbett, of Brownsville. My cows, while us ng it, made the largest average, and tested five points over average at C.M.P. at Brownsville. I know your goods are the highest class Stock Specific on the market, and take great pleasure in representing you in this district

NORMAN G. CHARLTON.

Royal Purple Poultry Specific

will make your hens lay in winter, as well as summer, and yet a 50c. package will last 25 hens 70 days, or a $1.50 pail or air-tight tin, containing four times as much as a 50c. package, will last 280 days. It prevents poultry from losing flesh at moulting time, cures and prevents all the ordinary diseases, makes their plumage bright, and keeps them in prime condition.

Port Colborne, May 11.
W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—This is to certify that I have used one $1.50 tin of your "Royal Purple" Poultry Specific, and there is nothing that can equal it. I wanted yours again and your agent did not have any, so he gave me another brand, and I can assure you it was not worth carrying home, for my hens layed better without it. I have been from 12 to 15 dozen eggs short every week since I have not used your "Royal Purple."

CHARLES RICHARDSON.

Royal Purple

STOCK AND POULTRY SPECIFICS

A second from Mr. Richardson as follows :—

Port Colbborne, Ont., Aug. 24, 1910.
W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—Please find enclosed express order for $3.00, for which please send me two tins of your "Royal Purple" Poultry Specific.

C. RICHARDSON.

A third letter from Mr. Richardson as follows :—

Port Colborne, Ont., Aug. 29, 1910.
W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—I received two tins of "Royal Purple" Poultry Specific all O.K. I have tried all kinds of specific to make my hens lay, and I find that you are the only ones that manufacture the genuine article. All the rest, I think, is a waste of time and money to bother with. As an egg-producer, I cannot praise your Poultry Specific high enough, for I would not be without it if I had to pay double the money.

C. RICHARDSON.

Sherbrooke, Que., Aug. 1, 1910.
W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—I have used your Specific for one year, and have given it to my birds with good results. See my winnings at the different fairs, which will tell the tale.

MISS GEORGINA CAMIRAUD.

Royal Purple Cough Specific

During the last four years there has been an epidemic cough going through every stable in Canada, which has been a great source of annoyance to horsemen. Our Royal Purple Cough Cure will absolutely cure this cough in four days, will break up and cure distemper in ten days. Absolutely guaranteed. 50c. per tin; by mail, 55c.

Royal Purple Gall Cure

will cure all sorts of open sores on man or beast. Will absolutely dry up and cure scratches in a very few days.

MR. SAM OWEN, coachman for the Hon. Adam Beck, says: "By following directions, I find your Royal Purple Gall Cure will cure scratches and make the scabs peel off perfectly dry in about four or five days." Price, 25c.; by mail, 30c.

Royal Purple Sweat Liniment

will reduce lameness in a very short time. Mr. John M. Daly, coalman in London, says: "We have nine horses constantly teaming coal, and have all kinds of trouble with them being lame at times. I have used your Sweat Liniment for a year back, and have never known it to fail to cure sprained tendons, etc." Price, 50c., 8-ounce bottles; by mail, 60c.

Royal Purple Lice Killer

This is entirely different from any lice killer on the market. In order for you to understand the process of manufacture of this lice killer, you will have to send for one of our booklets, as we give you a full history of it there. It will entirely exterminate lice on fowls or animals with not more than one or two applications. It smothers them. Price 25c.; by mail, 30c.

Royal Purple Disinfectant (Sheep Dip)

In this line we give you the largest value for the money of any disinfectant on the market. A tin containing 1 3-8 qts. Imperial measure will cost you only 50c. Also put up in 25c. tins.

Royal Purple Roup Cure

Mr. Dulmage, the great breeder, of White Rocks, tells us that he has never used a Roup Cure that will give relief so quickly to hens suffering from Roup or kindred diseases. Our book tells you all about it. 25c. per tin; 30c. by mail.

Royal Purple Worm Powders

For animals. 25c. per tin; by mail, 30c.

In using our Stock Specific, we guarantee you better results by using the ordinary food grown on your farm, such as good hay, oats and bran, and so forth, than you can possibly obtain by using any of the many patent foods on the market. In these the percentage of nutrition is usually very small for the amount of money paid for the same. You know exactly what hay, oats, bran, chop or any farm products cost you, and ROYAL PURPLE makes animals digest these foods properly.

What we wish to impress on your mind is that we manufacture nothing but pure, unadulterated goods. Our booklet gives over 300 recommendations for our different lines from people all over Canada. While we give you above the names of a few who have used it, our best recommendation is for you to ask any person who has ever used any line we manufacture. 26

These goods may be obtained from, Halifax Seed Co., Halifax; Amherst Trading Co., Amherst; A. Horne & Co., Charlotte town; Maynes & Riley, St. John.

W. A. JENKINS MANFG. CO., London, Ont.

AN ASSORTED ORDER AMOUNTING TO $5.00 WE WILL PREPAY.

The Maritime Stock Breeders in Annual Session.

The annual meeting of the Maritime Stock Breeders' Association was held in Truro, N. S., on Jan. 15th, 1913. Col. H. Montgomery-Campbell, president of the Association, occupied the chair and about a quarter of a hundred prominent stockbreeders were present.

The Minutes of the last meeting were read and approved.

The President reported that during the year the Association had succeeded in getting their grants increased from $2,500 to $4,000. The Horse Show account showed expenditures amounting to $3225.05, a sum of $150.75 over receipts. By a slight change in the rules governing the prize list this deficit may be avoided in future years. At the recent Winter Fair 90 per cent. of the amount offered for prizes was taken by the exhibitors—$3428.00 went to Nova Scotia, $1374.30 to New Brunswick and $1921.00 to P. E. Island exhibitors.

By unanimous vote it was decided to hold a horse show in the spring of 1913 on dates to be selected by the executiv?. It was decided that the Executive Committee be empowered to debar from showing any horse not shown to a suitable rig. The work of arranging and revising the prize list was left in the hands of the Executive Committee.

The conduct of railway officials in their careless shunting, starting and stopping of live stock trains enroute to and from the exhibitions came up for considerable discussion and a committee cosisting of Messrs. J. B. Daggett, C. A. Archibald and J. F. Roper was appointed to interview the proper authorities with a view to secure mitigation re this matter.

The selection of judges for Maritime exhibitions was also discussed and the feeling was very strongly expressed that the various fair boards should confer in this matter with the Stock Breeders' representatives to the fair boards. A haphaszard system of selecting judges for the live stock classes of the fairs is very unsatisfactory to the breeders, particularly when judges are secured who do not seem to know their business. Stock breeders are no longer willing to trust the reputation of their herds to unqualified judges.

The election of officers resulted as follows:

President — Col. H. Montgomery-Campbell, Sussex, N. B.

Vice-Pres. for Nova Scotia—W. W. Black, Amherst.

Vice-Pres. for New Brunswick— A. E. Trites, Salisbury, N. B.

Vice-Pres. for P. E. Island —Hon. Murdo McKinnon.

Directors for N. S.—H. W. Corning, M. L. A.; W. W. Black, R. S. Starr and S. A. Logan.

Directors for E. B.—R. A. Snowball, B. M. Fawcett, A. E. Trites and M. A. Scovil.

Directors for P. E. I.—W. M. Lea, J. F. Roper, Hon. Murdo McKinnon and Albert Boswall.

Delegates to Fair Boards— Col. H. Montgomery-Campbell, R. A. Snowball, W. M. Lea, J. F. Roper, R. S. Starr, S. A. Logan.

The Best Way to Cleanse Milk.

The best way to cleanse milk is by centrifugal force, as may be observed by examining the interior of the separator bowl immediately after some milk has been separated. The inside of the bawl will be found to be covered with a layer of dirt in the form of a thick slime. Where large quantities of milk have to be cleansed, a centrifugal cleaner is generally employed. In this case the milk is subjected to centrifugal force in a bowl, or drum from which there is only one outlet instead of two as in the case of a cream separator. Milk which has been centrifugally cleansed is absolutely free from all kinds of extraneous matter which cannot be removed from the milk by other means.

Wouldn't YOU Like To Be Able

To know—when to sell your live stock and produce so as to get the best market prices.

To get the weather reports in *advance* and so avoid damage to your crops.

To order spare parts for broken farm machinery, without having to lose time and drive miles to do it.

To summon medical assistance—instantly—in case of illness or accident.

To talk to your neighbors at *any* time—day or night—or get their help in case of fire.

To get the veterinary *quickly* when sickness strikes your live stock.

You Can Do All This—and Much More When You Have a Telephone

YOU CAN get a Telephone *at a small cost* if you will send us your name and address.

YOU and your neighbors can build, own and operate your own, Self-paying Rural Telephone System at a cost to each of the value of about 20 bushels of wheat.

WE—the Northern Electric & Mfg. Co., Limited—the *largest* and *oldest* telephone manufacturers in Canada—will *help you* to do it and *guide you* in every step of the construction work.

OUR FREE BOOK—How to Build Rural Telephones—the *most complete* work of its kind ever published—is yours for the asking.

IT TELLS you how to form a company—what material is necessary, and how to build your own line—how to operate a Rural Telephone System from start to finish—in clear, straightforward language that a child could understand.

IT CONTAINS one hundred pages—profusely illustrated—and makes the construction of a telephone system as easy as building a fence.

BE THE FIRST man in your district to suggest the idea to your neighbors. Study our Free Book so that you will know all about Rural Telephones—then it will be easy to interest your friends.

YOU CAN GET our book by simply writing for it—it costs you nothing—and we will be glad to know that you are interested.

Hadn't You Better Drop Us a Post Card Now?
You'll Get Our Book by Return of Mail.

"Uniformity is a big word, Bud."
"I 'spect it's because it means a lot, Rose."

Steady—Regular—*Dependable* Quality, there's the FIVE ROSES idea.

No bad dreams bakeday eves — the morning batch "flat" instead of "up."

So very exasperating, you know, to get *less* loaves this week than last from the *same* quantities.

FIVE ROSES is the sure flour — *reliable*, you see.

No wrinkling worries over bread, or cakes, or pies, or anything.

Bake things always *up to the mark* of your happy expectations.

Disappointment—*never*.

Four times Uniform—Strength, Color, Flavor, too, and Yield.

FIVE ROSES—*trouble-proof* flour.

Use FIVE ROSES *always*.

Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, (*Licensed Architect*)

10,000 Sold in 30 Days

Price $2.00 Prepaid

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS :

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete—Proportions—Sand and Gravel—Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

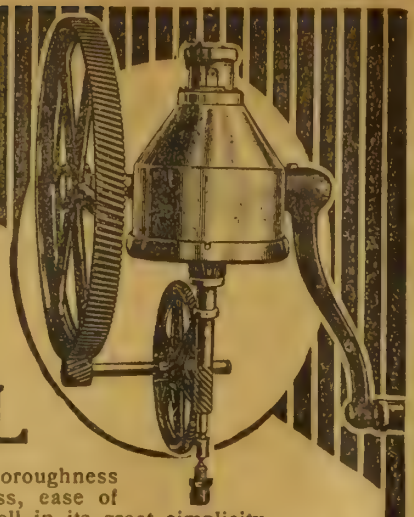
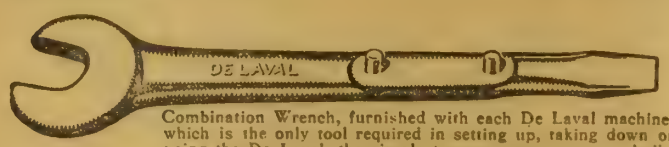
The Simplest CREAM SEPARATOR Ever Built — DE LAVAL



EXCELS ALL OTHERS not only in thoroughness of separation, sanitary cleanliness, ease of running and durability, but as well in its great simplicity.

THERE IS NOTHING ABOUT THE OPERATION, CLEANING, adjustment or repair of a modern De Laval Cream Separator which requires expert knowledge or special tools.

NOR ARE THERE ANY PARTS WHICH REQUIRE FREQUENT adjustment in order to maintain good running or to conform to varying conditions in the every-day use of a cream separator.



Combination Wrench, furnished with each De Laval machine, which is the only tool required in setting up, taking down or using the De Laval, the simplest cream separator ever built.

THERE IS NOTHING ABOUT THE MACHINE THAT CANNOT be taken apart, removed or replaced by any one who can use a wrench or screw driver. In fact, the only tool which is needed in the use or the operation of a De Laval Cream Separator is the combination wrench and screw driver illustrated above, which is furnished free with every machine. Visit the local De Laval agent and see for yourself its simplicity of construction.

Silage Would Increase Your Dairy Profits

This winter weather, when dry feeding is reducing your dairy out-put, don't you often wish that you had erected a silo last summer?

If you had done so you would right now be feeding your cows succulent and milk-producing silage, just as good a milk-producing food as green summer pasturage, and getting a good deal more milk and making more profit out of your dairy.

All successful dairy men now-a-days consider a good silo a very necessary part of their dairy equipment and there is no question but that feeding silage greatly increases the milk flow.

If you haven't a silo perhaps you have made up your mind that this is the last year you are going to get along without one.

If so, don't put off ordering it until late next summer and perhaps find yourself in the same fix next year.

Write to-day for 48 page Ideal Green Feed Silo Book

This book contains much interesting and valuable information about silos, silage and silage feeding, and even if you are not yet ready to buy, you will find the book interesting and instructive.

More than twice as many Ideal Green Feed Silos were sold last year than in any previous year. If you keep cows you need a Silo. Full specifications are given in the Silo book. Be sure to write for it.

We are exclusive distributers in Canada of the World's Standard De Laval Cream Separators, and also carry a complete line of creamery and dairy machinery and supplies. If interested write for separate catalogs.

Sanitary Remodeling of Dairy Barns

By R. S. Smith, Maine State Dairy Inspector

THE question of building a modern dairy stable on many farms is of course complicated by the fact that already there are one or more barns present in a fairly good state of preservation. These barns were considered good enough twenty to forty years ago, when they were built, but owing to the introduction of modern machinery and better methods of caring for live stock and dairy products, they are now in about the same class as the log cabin or sod house would be for human beings. These barns are often too good to destroy or pull down and must be used in some scheme of reconstruction if economy is to be considered. On the other hand, the farmer must not forget that labor is a constant and continuous charge and that any arrangement or device that saves time or labor is worthy of careful consideration.

Through mistaken ideas of some writers, many or our farmers have developed the idea that to keep cows clean and healthy and to produce sanitary milk they must necessarily have expensive barns and that remodeling of old ones means a great expense to them.

Instead of remodeling the cow stable that may have been in use many years, necessitating nearly a complete reconstruction, many dairymen have built a new tieup as an ell to the main barn and without any overhead portion or cellar. Often this new building can be put and equipped with litter carrier, sanitary stalls and cement floor at a little greater cost than remodeling, but this depends on the judgment of the dairyman, when plans are made and the cost of changes estimated.

The purpose of this article is to point out a few suggestive changes that have been possible, without any great expense, in some of the barns visited in different sections of the State. These suggestions, no doubt, would apply to many not visited, to the end of securing more sanitary surroundings, for the cow and man in their labors of producing that universal, indispensable product,—milk.

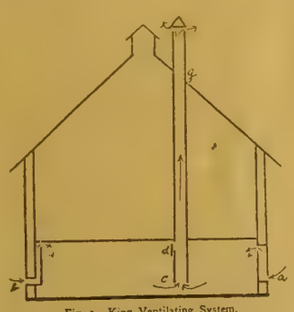

Fig. 1. King Ventilating System.

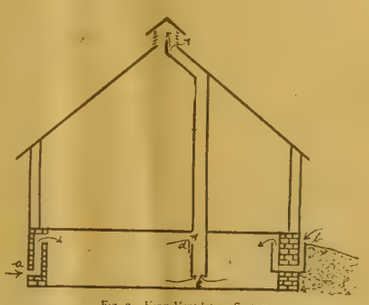

Fig 2 King Ventilating System

STABLE VENTILATION

An abundance of fresh air in the cow stable is very essential to the efficiency of the dairy herd as well as to the quality of the product.

The air of the stable is too frequently close and filled with dust and disagreeable odors. That the milk fat will absorb odors and that dust falling into the milk is extremely dangerous, is a well known fact.

It is a common experience to enter the cow stable in the morning and find the air very close and uncomfortable, a condition which surely could not be the best for the health of the animals that have stayed there all night.

According to the late Prof. King of Wisconsin, a cow in order to supply the amount of oxygen needed in her body, must breath 2804 cubic feet of pure air in 24 hours. The amount of oxygen she consumes from this amount of air is about 11.04 pounds.

The air space in a barn may be large but the abundance of fresh air is of more importance. The smallest stable may have more fresh air than the largest one; it all depends on the ventilating system.

The highly specialized dairy cow demonstrates that fresh air in abundance is necessary. She is closely confined during the winter months and in many cases is kept in ill-ventilated stables which have the additional disadvantage of being poorly lighted. This is contrary to nature and consequently she produces less than when out in the fresh air and with nature's environment.

That these conditions exist and are in a large measure responsible for the presence of disease cannot be doubted.

That conditions must be changed is evident from the following figures showing number of cattle condemned and killed for tuberculosis in this State in six years, taken from the Cattle Commissioners' Report.

1905	625
1906	970
1907	802
1908	925
1909) 1910)	2932
Total	6254

A few dairymen are waking up to the detrimental effects of such conditions on the animal and the amount of the product, and are remedying their defects by remodeling their old stables or building new stables that house the dairy animals only.

From experiments in Scotland on the influence of temperature on the milk yield, the following results were obtained:—If there is any restriction of ventilation sufficient to bring the temperature of a stable up to 60 degrees, there is a degree of atmospheric impurity inconsistent with the conditions of perfect health.

In stables in which the temperatures have been kept down by thorough ventilation in autumn, cows do not suffer either in health or milk yield even from very low temperatures in winter.

Whatever the waste of food may be, in the maintenance of the body heat of cows in colder stables it is more than counteracted by the influence of fresher air, because it is evident that the health of animals is much more likely to be promoted by active digestion than by the mere preservation of body heat. Colder temperature in the autumn causes the cow's hair to grow and she will retain thick coats of winter hair, thus preparing herself for nature's environment, but instead she is shut up in a poorly ventilated stable making a condition detrimental to her health.

A careful attempt should be made to give such a degree and kind of ventilation as will, without creating draughts, keep the temperature of the stable down to 50 degrees.

These are suggestions from Scotland which might well be observed and practiced on our Maine farms.

The mistake of having direct draughts instead of a thorough system of ventilation has been made too often by carpenters in building cow barns. The old idea under which a large percentage of Maine barns were built was to have an opening at the top of the window or door for entrance of the air and the outlet in the cupola.

The builder in many cases failed to get at the bottom principle of ventilation. That is, before you can get fresh, pure air in the room you must first take the foul air out; do this and the desired outside air will come in. The first step must be taken first. In every true system of ventilation two things are absolutely necessary. First, get the foul, used-

(Continued on page 341)

The N. B. Farmers and Dairymen in Annual Session

The Thirty-Seventh Annual Convention of the New Brunswick Farmers and Dairymen's Association was held in the city of Fredericton on the 17th to 21st inst.

At the opening meeting in the Council Chamber about fifty representative farmers were present. This number was augmented to upwards of one hundred and twenty-five at some of the later meetings. L. H. Smith, President of the Association, capably presided at the various sessions.

THE PRESIDENT'S ADDRESS

Gentlemen of the Farmers and Dairymen's Association:

In calling this meeting to order I wish to say that it is a pleasure for me to see delegates present from all parts of the province representing the different branches pertaining to agriculture. This shows that you are interested in the advancement and prosperity of our good province, and are willing to help promote an increased interest in the work of this association.

In looking back over the past year we surely have much to encourage us for the future. Since we last met this province has been placed on an equality with all the other provinces, and has had an Experimental Farm established in a central locality. This will, in the course of but a short time, prove of great value to all who study with interest the successful demonstrations conducted in the growing of different crops.

In New Brunswick one of our greatest needs from an agricultural standpoint, is a school system which will give to the young a practical agricultural education, if they so desire one. Up to the present time we were unable to receive this education unless we went outside the province. It is with much satisfaction we are looking forward to the establishment of two agricultural schools which will be able to impart practical education. The day of thinking that the farmer needs little or no education is gone forever, and today successful farming is a business which calls for one who has given study and thought to the various conditions which surround him.

No better evidence is needed for the demand for agricultural education than the fact that the Federal Government has this year granted the sum of ten million dollars for this purpose.

This amount is to cover a period of ten years. We in New Brunswick will this year receive $44,500, and this will have a yearly increase of $4,900.

Such a generous grant in the province when devoted along the line laid down by the Government will prove of immense value, and give new life to the greatest industry of the land.

Another forward step which is taking place this year is the general interest and demand for an improvement in the highways of the Province. No class of people will receive more direct benefit than the farmers, although in far too many cases they appear indifferent in this most worthy cause. Let us give our sympathy and co-operation in this matter and strive to keep politics out of both agriculture and the management of our highways.

Throughout the whole province there is an increased interest in regard of the future, and we are just beginning to realize as we never did before the opportunities New Brunswick affords.

Great advancement has been made in the fruit industry, while only within the past few years fruit raising received but little attention.

The increase in the value of both city real estate and nearby farming lands is ample proof that both our own people and the outside investors as well, have faith in the future development of our province. If we would but talk of our many advantages instead of dwelling on some of our petty grievances we would be taking a long step in the direction of doing our province justice. Let the people and the press unitedly work for the advancement and prosperity of our country, and make its future great in proportion to its natural advantages and general resources.

THE WELCOME TO THE CITY OF FREDERICTOE.

was extended by his worship Mayor Hooper. He referred to the fact that his first official duty in 1912, when he was installed in office, was to welcome the members of the N. B. F. & D. A. to the city and his second opportunity to repeat the welcome has now come just three weeks before the expiration of his term in office. He made fitting reference to the spirit of optimism that permeates the citizens of his town. The opening up by the Valley Railway of a fertile country, hitherto suffering through lack of transportation facilities was giving the people of these districts a new faith in their country. Mayor Hooper also referred to the very prominent place the subject of advanced agricultural education received in the speech and reply to the speech from the throne at the recent opening of the New Brunswick Legislature.

The Dominion Experimental Farm at Fredericton and the proposed agricultural schools at Sussex and Woodstock all come in for a share of commendation. In closing, Mayor Hooper referred to the Fredericton exhibition, of which he is Secretary-manager, as the biggest little exhibition in the world. He called for the genuine support of the New Brunswick farmers. He asked them to make exhibits and capture a greater proportion of the prize monies. He also offered the farmers the free use of his office while in the city and invited them to offer suggestions re apportioning of prize money.

THE REPLY TO ADDRESS OF WELCOME

was fittingly made by Ashley George, Vice-President of the Association. The association members always came to Fredericton with a feeling that a hearty welcome awaited them. The success attained by the Fredericton exhibition, referred to by Mayor Hooper, was due to skillful management and hearty co-operation of the citizens of the city in which it was held. To make it a bigger exhibition it only required the co-operation of the rural public, who can contribute their mite in the way of making exhibits in as many departments of the fair as they can.

In regard to the high cost of living cry it was noised abroad that farmers were charging exhorbitant prices for their produce; but the person who takes the trouble to figure on the capital invested by the farmer finds that at ruling prices very little is left to pay as dividends after the wage bills and other running expenses are provided for.

Experimental farms and agricultural schools served their purpose, and while farmers, as a rule, admire scientific farm work yet a great many do not understand the underlying principles. He believed that demonstration farms would best serve the farmers by showing them how certain ends were accomplished. Scientific agricu.tural knowledge practically applied was destined to place the farmer on as high a plane, industrially, educationally, socially and otherwise as is the devotee of any other legitimate calling and prepares him for the assembly halls of our country where more farmer representatives ought to be.

In conclusion, Mr. George referred to the good roads agitation. While he was heartily in accord with the objects of the association, he would not support any movement that would have a tendency to take monies that should be spent on roads leading to points of shipment and use them on main trunk lines thus making a road more for the pleasure of the motorist rather than for the practical use of the farmer. Trunk lines paralleled the railroads and it was not customary for farmers to haul goods for very long distances paralleling other routes of transportation. The roads mostly used by the farmers are the roads leading to their nearest villages and principal shipping points and these are the roads that should receive first consideration from the powers that be.

HON. D. V. LANDRY,

Commissioner for Agriculture, referred to the advances which New Brunswick had made agriculturally during the past few years. He asked the delegates to discuss and deal with the various vital questions brought before the meeting with an eye single to the best interests of their profession. In reference to the rapid increase in the number of agricultural societies in the province, the Dr. said his aim was to have an agricultural society organized in every important centre in the province.

He was a firm believer in associations and would like to see the horsemen, cattle breeders, sheep breeders, swine breeders and poultry breeders organize special associations for the fostering and upbuilding of their various industries. He did not approve of spasmodic effort. The effort, in order to be of any value, must be a persistent one.

Dr. Landry also referred to the rapid strides that are being made in horticultural lines and the stimulus that the industry had received since Mr. Turney and his assistant, Mr. Gorham, had been appointed to office. The world was just awakening to the fact that New Brunswick can grow fruit of the highest quality and can hold its own in this respect with any part of the universe. Fruit growers were now procuring their young trees through the association at a greatly reduced cost, and with the assurance that the trees are true to name and not a nondescript lot as was too often the case when trees were indiscriminately purchased in former years.

The farming special train had been well patronized at the various points visited and the cost had not been excessive.

In regard to the dairy industry he said the past year had been the second best year in the history of New Brunswick dairying. The returns were only a few thousand dollars short of the returns of 1903, the banner year. His department purpose getting additional men in the field to further develop this important industry.

The Farm Settlement Board was doing good work in repopulating the abandoned farms of the province. He asked the farmers to co-operate with and facilitate the working of the board by sending them a list of the vacant farms and possibilities in their respective districts, and also by acquiring the spirit of boost and talking of New Brunswick in general and the home district in particular.

In closing Dr. Landry put forth a plea to the young men of the province to attend the agricultural schools and visit the experimental farms and in other ways take advantage of the opportunities which are being provided for them.

SOME GOOD ADVICE

was given by Bishop Richardson, of Fredericton, who is one of the boosters for New Brunswick and one who lives in close touch with its people. He has been instrumental in persuading many young men who had been attacked by the "Lure of the West" to remain in New Brunswick. The "lure of the lumberwoods" was also working havoc amongst the young men of some districts. He thought the majority of them would do better if they remained at home on their farms and grew more live stock.

In regard to keeping boys on the farms, Bishop Richardson said that the solution lay in the hands of the fathers. Make it worth their while to remain and work the farms with you; give them wages and an interest in the farm. Don't practice loose habits. Begin the reform with yourself and put modern conveniences in the farm home . Nature has been lavish with her gifts; make the best use of them. Make up your minds as to what you want and then work towards that end and very soon your aim will be accomplished. You can hav? good roads if you want them. Stop hoarding your money at 3 per cent. and invest it in your farm. Don't allow bankers to grow rich by banking your money with them so that they may lend it to upbuild other lines of industry at big interest rates.

MR. C. N. VROOM,

President of the New Brunswick Fruit Growers' Association said the farmers of Eew Brunswick were all after progress. The only farmer who is not making good is the man who is not looking for progress. He was a firm believer in multiplicity of organization and went on to relate what had been accomplished by the fruit growers since their association had taken on a new lease of life.

He advised every farmer to set out and care for a few trees for a home orchard. He was confident that New Brunswick could excel the world in the production of certain varieties of apples. He predicted that New Brunswick would some day be called the "land of the big red apple" (McIntosh Red). He gave facts and figures re profits that had been made by N. B. fruit growers who had gone forward and cared for their orchards in an up-to-date manner, giving due attention to pruning, cultivating, spraying, etc., and their example should be an incentive for others to go on with more scientific progress.

COUNTRY REPORTS.

Interesting, optimistic reports re crop, weather and other conditions in the various counties were given by the county vice-presidents, several of whom offered some valuable suggestions for the upbuilding of a bigger and better agricultural development.

COMMITTEES APPOINTED.

The appointing of Resolution, Finance and Nominating Committees concluded the first evening's session.

ON TUESDAY FORENOON

the Association met in the exhibition building where Dr. J. Standish, of the N. S. A. C., gave a practical demonstration of the desirable and undesirable features in heavy horses.

A quartette of heavy horses from the New Brunswick experimental farm, were used for demonstration purposes. He demonstrated the various points that should be looked for when purchasing a horse. Questions asked were cheerfully answered and the interest of the audience was well maintained.

PROF. STEVENSON, OF THE N. S. A. C.,

gave a demonstration lecture on hudging dairy cattle during the afternoon session.

Harding Bros. and W. T. Harding, of Welsford, had some of their prize-winning and much admired Holsteins in the ring. W. H. Moore, Scotch Lake also showed a pair of grade cows. His demonstrations were lucid and easily followed. His answers to the numerous questions in cowology were carefully answered and a profitable afternoon session was spent.

ON TUESDAY EVENING

the first number on the programme was "The Breeding and Rearing of Heavy Horses" by Dr. Standish, who explained the principles involved in breeding, weaning, training and rearing of the foal until it comes to the age when it takes its place in the permanent farm team or is sold. His talk involved the care of the feet and how some defects may be remedied by giving them the necessary attention when required.

THE BREEDING AND FEEDING OF DAIRY CATTLE

was the subject of an illustrated lecture by Prof. Stevenson, who emphasized the importance of good feeding. Without proper feed it was impossible to properly develop an animal in bodily growth or in producing qualities. Every effort should be made by farmers to grow the bulk of the feeds consumed on their farms. The best way to fertilize a farm was by feeding the home grown grains, clovers, roots and corn to live stock. Dairy heifers should be developed early in life but he would not advise overfattening them. It was a big mistake to stunt a calf because a stunted calf would never make a profit-producing animal. The lantern slides contrasted the difference of conformation as found in dairy and beef cattle.

THE LEGAL AND MORAL REQUIREMENTS OF UP-TO-DATE FRUIT PACKING

were discussed by S. L. Peters, Fruit Inspector. He gave a clear interpretation of the Fruit Marks Act and how it was enforced. He thought no country under heaven can put more quality into fruit than can New Brunswick. Several samples of apples—Kings from Deer Island, Princess Louise from Upper Sheffield, Bishop Pippin from Gagetown and Merritts from Queenstown shown by Mr. Peters showed the quality that New Brunswick can put in those varieties. In regard to the moral aspect of the question, Mr. Peters said it was incumbent on every fruit grower, if he would have New Brunswick fruit acquire a world-wide reputation, to so pack his fruit that the brand will be a sufficient quarantee to the purchaser. That there was ample room for the extension of the fruit growing industry in New Brunswick was evidenced by the fact that thousands of barrels of apples were yearly imported and even at this early date it was impossible to find new Brunswick grown fruit for sale in Fredericton. He strongly advised feeding No. 3's to live stock rather than putting them on the market.

WEDNESDAY

forenoon was taken up with a discussion on hudging sheep and wool by Andrew Elliott and James A. Telfer, while the afternoon session in the council chamber was a continuance of the discussion on Sheep Raising Problems by the same speakers. Messrs. Telfer and Elliott are both practical sheep men—men who have acquired the knowledge of sheep husbandry by practical experience and as such their addresses were eagerly followed.

THE CONSERVATION OF FARM MANURE

was the subject of an excellent paper prepared and read by M. A. Scovil, of Gagetown. Mr. Scovil was highly complimented by the president, Prof. Grisdale and others on the thought and care he had exercised in presenting a study of his subject to the Association. The paper will be published in full in a later issue of the Farmer.

THE FINANCIAL STATEMENT

showed a cash balance of $96.32.

THE WEDNESDAY EVENING SESSION

was held in the opera house and the attendance was one of the largest of the Convention.

His Honor Lieut. Governor Wood occupied a place on the platform, and being called by the president gave a short address of encouragement.

The meeting was of especial importance in view of the addresses by Dr. C. C. James, special Commissioner for the Dominion Department of Agriculture, and J. H. Grisdale, Director of Experimental Farms.

THE PRINCIPLES AND BEST PRACTICES OF SOIL CULTIVATION

was the theme of an address by Prof. Grisdale. He laid emphasis on the advantages of systematic growing of crops by employing the rotation system and showed that not only will the yield be greater but economy will be effected. Experience has demonstrated that large crops can be raised by means of rotation, a great saving of time and expenditure will follow and only when the farmer realizes the benefits of systematic soil cultivation can he get the best possible returns from his land.

The system of crop rotation, the speaker said, is being tried out on all the experimental farms under the department of agriculture and the results prove it successful. It is merely introducing business methods into land cultivation and supplanting the antiquated idea. By putting the land under rotation, a larger crop is possible, the soil will be improved, and the farmers will reap a greater benefit from the time and labor expended than he is doing by following the present methods.

"The sooner our farmers come to realize the advantages of using crop rotation the better for the country. The solution of the whole problem of agriculture depends to a very great degree on the adoption of the system. The farmers of New Brunswick, I am almost certain, can under the system double their present output in five years."

The speaker then went on to explain the various systems of rotations viz., three, four, five and six year rotations.

The advantages of rotation Prof. Grisdale stated, are first, the lessening of the labor item, a certainty of crop returns greater than where no system is followed in cropping. Moreover, agricultural operations carried on systematically are conducive to the lowering of cost and the rapidity of performances of these operations for the delay will be less than when the operations are carried on over scattered sections. All the land will be working all the time.

After the question of rotation, next in importance is the saving of cost of production in the using of good, up-to-date machinery. He gave facts and figures which showed the lessened cost of production when bigger machines and more and heavier horses are used.

In concluding, Mr. Grisdale said that the statistics gathered from the different experimental farms all over Canada prove the benefit of rotation. Especially from the statistics based on the work at the central farm at Ottawa where conditions are fairly comparable to those of New Brunswick, this is true.

At the experimental farm to be established here at Fredericton crop rotation, soil cultivation and live stock raising will be tried out along the most approved methods, so that the farmers of New Brunswick may see for themselves and obtain all necessary information on the best methods of scientific farming.

He strongly recommended farmers to seed heavily with timothy and clover in order to get the best quality of hay.

THE OLD AND NEW AGRICULTURE.

Dr. C. C. James, who followed Prof. Grisdale, pointed out that the agricultural question is one of national proportions and as such, demands the attention of both residents of the city as well as the farmer.

Never before in the history of the country has there been such an interest in this subject; three times a day it confronts the city man when he sits to the table and realizes the high cost of living.

A bond of sympathy never before known, or rather a relationship between the farmer and the resident of the metropolis has been established through the changed order of things. Np longer are the affairs of the farm confined to the limits of the four walls of the farmhouse; never had the people of the city so much concern as to what the farmer is doing as they have today. It is becoming realized that the great question of agriculture is one that affects both, it has extended to the cities as well as farming communities, and must be solved to a certain extent there. It is a national problem, and the proper solution of it is a matter of prime importance.

At last the populace were beginning to realize that agriculture is Canada's greatest asset, greater than any of our resources and it was our first duty as citizens to see that it is properly developed.

It involves a great many difficulties and for the solution of these the individual effort and support of every farmer and every resident of the city is required. Yet it is a deplorable fact that we find so many of the farmers lacking interest in this question as a national problem.

They are content to let their neighbor solve it, and are blinded by a sophistry which makes them believe that their individual holdings are of insufficient importance. They are content to follow the old order of things, and fail to co-operate in advancing the cause.

That there is such a lack of interest in a question of vital importance is almost inconceivable. How easy in comparison is it to arouse a sufficient degree of interest in the construction of a railway to raise a million dollar capital; yet it is because of agriculture that a railway exists.

The speaker pointed out the need of co-operation with the work of the government and organized effort among the farmers themselves. It is of little value for the government to appropriate sums for the development of agricultural resources unless there is shown on the part of the farmer an interest in what is his own concern, and what is a concern of interest to the whole community. It is an industry which reaches into the towns and cities, both farmer and city man must benefit by the solution of the problems which effect agriculture. And it is for the farmer to look beyond his personal affairs and remember that he can do a share towards aiding in the solution of this national problem by individual effort and co-operation with others in his community.

The appropriations of a government towards agriculture should not be looked upon as a charity; they are giving assistance to the reconstruction or establishing on a business-like basis of a big industry which is to benefit all classes. Those whom this industry affects owe it to themselves and the community to lend their aid to making this industry what it should be; by improving conditions of agriculture we are improving conditions of the whole community.

If the possibilities which this industry present are great to the aggregate they are likewise so for the individual, and individual work is necessary. The problem of agriculture touches the whole nation and it touches each farmer, no matter how insignificant his share in the world's production. If the farming communities of the East will grapple with the problem there will be an added lustre for the agricultural future of the Maritime Provinces.

It is a pleasing fact that during the past year the province of New Brunswick has shown an increased interest in its agricultural possinilities; it is not necessary to go to the West to see a magnificent farming country and if the people here have not awakened to this fact it is about time they did so.

Dr. James' address was followed with great enthusiasm. Replete with optimism regarding the future of the East, the address appealed to all, and his urgent appeal to the farmers present to awaken to the changed order of things and to the necessity of personal interest and interest in helping work out the agricultural questions seemed to strike a responsive chord.

THE NEW BRUNSWICK PROVINCIAL SEED FAIR

was held in the exhibition building on Thursday. There was a goodly number of exhibits in the various sections. S. J. Moore, of the Seed Division and Prof. Boving, of McDonald College placed the awards and also gave demonstration lectures on the judging of seeds and roots which proved highly instructive to their audiences during the forenoon and afternoon sessions. Pcof. Boving replied to a great many questions re the growing of roots, a subject which was seemingly a live one in the minds of the farmers and which is yearly receiving more and more attention in New Brunswick.

A POULTRY SHOW

was also held concurrently with the other good things on the programme, and a very creditable showing was made in every section. S. Jones, Poultry Superintendent, placed the awards which will be published in full in those columns.

THE POULTRY INTERESTS OF CAEADA

was the theme of an address in the council chambers on Thursday afternoon, by W. A. Brown, Dominion Poultry Superintendent. He said:

"A trainload of cars nine miles long would represent the import of eggs into Canada for 1912." All through the Dominion there is an increased consumption of eggs; and the indus-

HAVE YOU PHOTOS OF INTERESTING GARDEN AND ORCHARD SCENES ?

We wish to get photos of Maritime Province orchard and garden scenes. If you have any such photos in your possession or if you know any of special interest in your locality, we would be pleased if you would forward them to us. We will have cuts made for insertion in the columns of the Maritime Farmer and will return photos undamaged. When sending photos please write your name and address and also a short description of scene and on whose farm it was taken, on back of photo.

NOVA SCOTIA FRUIT GROWERS WANT A HIGHER STANDARD FOR NO. 2's

At a recent meeting of the Nova Scotia Fruit Growers' Association, R. J. Messenger, of Bridgetown, introduced a resolution recommending that the Fruit Marks Act Standard for No. 2 apples be raised so that No. 2, as placed on the market, shall include no culls, consist of well-grown specimens of one variety, sound, of not less than ninety per cent. free from scab, wormholes, bruise and other defects and properly packed. The resolution was passed almost unanimously. The best thinking fruit growers of Nova Scotia are determined to have a law that admits of only one interpretation. They recognize that the shipping of a hetrogenous mass of apples branded as No. 2 but in many cases as we have seen them opened up in village stores, a disgrace to the shipper, a disappointment to the buyer and a detriment to the honest packer.

That Nova Scotia fruit growers are honest in their convictions and want to give the consumers a square deal is evidenced by their unanimity in asking for an act that will make a No. 2 practically as clean and good as a No. 1 apple but smaller in size.

We feel that the fruit growers of the other fruit-growing countries will arise to the occasion and voicing the sentiments expressed by the Nova Scotia fruit growers assist in getting the Act amended as herein suggested.

WHERE ARE THE SHOWS LEADING

Each year sees a higher class of dairy cattle led into the show rings of the various fairs and shows. Each season finds the exhibitors devoting more attention to fitting their herds. At the same time there is a growing tendency to use the same herd for show and production purposes. This is a fortunate solution of what at one time seemed to be something of a problem. A man of considerable prominence as a breeder has suggested that greater attention be brought to the combination of type and utility, particularly in connection with the bull. He believes, and the stand is well taken, that the bull who ranks high as a show animal should be equally valuable as a breeder. There have been in various live stock circles sires that were kept purely for the show ring and were almost invincible in their class, yet were almost worthless as breeders. If an animal gets all of his honor and credit from show yard awards his fame will of necessity be rather short lived, for the public is quick to honor and quick to forget when newer individuals come in to claim its attention.

On the other hand, the bull that is a great show animal and at the same time perpetuates his type and individuality along with the capacity to produce profitably is sure to be remembered through his offspring long after his show days have ceased. This same tendency to combine type and productive capacity will improve the breeds by making the record cows attractive in appearance as well as valuable for what they are able to accomplish. This is one of the things that showing dairy cattle is bound to gain.

Another thing that is being realized through the shows is a better knowledge of individuality on the part of the outsider. It is encouraging to see how readily some who have had little experience in judging cattle can point out the weak and the strong points in the individual. It has not been so many years since all cows looked alike to the average man, but the short courses that the fairs and dairy show ringsides afforded have begun to bear fruit and the young men are becoming decidedly more discriminating.

Another thing that is being accomplished by the show is a better knowledge of fitting and handling cattle. Showing is an art in itself and the indifferent, listless man who brings his cattle to the ring depending upon the judge to find their inherent qualities even though the cattle may be shaggy, ill kept and poorly handled, is by no means so common as a few years ago. Such a man cannot expect to capture the prizes and his chances become smaller every year, which is as it should be.

On the whole the dairy cattle shows, both at the state fairs and the national events, are doing much to improve the quality of the cattle of this country and at the same time they are doing a work of equal importance in stimulating an appreciation of better cattle in the minds of those who are not breeders.

COW COMFORT

An Exchange publication says:

"Too many cows are compelled to be out in rough weather while the steer sleeps in a nice warm stall in the barn."

That statement represents the viewpoint too many farmers have of the care and comfort of the cow. Let us carry the thought a little further. The steer is storing up carbon every day in the form of fat. That means heat, internal heat. We have seen fat steers go out and lie in the snow as a measure of relief against the undue sense of heat they felt. Did any one ever see a cow giving a good flow of milk do that? Why? Because the function of milk giving takes the carbon and other elements out of the cow's body. To keep up that function she must be kept warm. Milk giving presupposes at the start a certain relaxed condition of the body. Consequently when cows are turned out in a wintry day, you will see them range up along the sunny side of the barn, out of the cold wind. They instinctively feel the need of a requisite amount of warmth because of the relaxed milk giving condition of the body they are in. Almost every farmer can see these signs of the truth of things if he will but thoughtfully observe.

Many cow owners have observed that they must keep their cows warm if they get a good flow of milk, and then knowing only half of the truth, they shut them up in tight stables and slowly poison them to death with foul air. Just as much as the cow needs warmth does she also need plenty of pure air and oxygen in order that she may manufacture a good supply of milk. The lungs play a mighty important part with the udder and the stomach in making milk. Professor King worked out the problem how to supply a stable of cows constantly with pure air, and keep them warm and comfortable at the same time.

The physiology of milk production is a very deep and complex subject. The more milk we demand of the cow the more wise and careful must we become to supply her, not only with the right kind of parentage whereby she may have both capacity and strong constitution, but we must know the right conditions to surround her with so she can do her best work for our profit. Only in the excerise of this double knowledge can we obtain cows that will yield us a good profit. How foolish and weak then is the position of any dairy farmer who is content to remain in ignorance of these important principles of cowology.

LIFE WORK FOR YOUNG MEN

There need be no alarm because boys select business occupations in preference to farming. All of us have our individual preference in business and in social life. Many boys have no inclination for farming and would fail if they should choose it as their occupation.

The fault is with our educational system that gives so little inspiration to boys and girls for country life and for the beauty and charm of nature. Both rural and urban schools should teach more about objects in every-day life; give more empahsis to manhood and womanhood as the crowning achievements of a useful life; stress the value of tilling the soil, producing the world's food; training flowers, growing fruits, breeding animals and plants.

Boys and girls should have freedom in selecting their life-work. Parents should discuss the various occupations with their children and always emphasize the importance of a useful life, the opportunities for advancing humanity rather than fame or fortune that may be acquired. Before children are advised to choose any occupation their adaptations and personal inclinations should be considered carefully. A mistake in this respect may handicap young people and divert them from channels of usefulness.

Our concern should be more for those who have selected farming as their life-work or have indicated a preference to till the soil, dress the earth and make it a better place for man's abode. These young people should be congratulated and encouraged upon their wise choice, and means should be provided for their education and training. The state is one of the beneficiaries in this choice; another balance wheel has been placed against under-production; society strengthened when another efficient producer is enlisted.

Let us assist those who are willing and anxious to live close to the soil; who wish to learn more of the secrets of nature and transform them into food, clothing and shelter for man, let us give encouragement and consolation and begin the work of rural development.

GETTING READY FOR SPRING

The thoughtful farmer has his season's work all planned out for next season. He knows about how many acres he will put to each crop, how many milk cows he will keep, how many sows he will have to farrow. It is all planned except the details and filling in, which he must do as the work is done.

It is well to have the harness in good repair, the tools put in readiness, the seed corn sorted, tested and graded, the seed oats all fanned and everything in readiness for the busy rush of spring. Much preliminary work can be done of the many small things that in the aggregate are important.

Many springs are wet and unsuitable to do much work, so it stands us in hand to be ready when the opportunity presents itself, and all of this valuable time can be used in getting ready. Go around the fences—do what is necessary to keep the stock right where you put them. Poor fences make breachy stock. Clean the brush out of the way, so it will not bother in the spring. It is good to stop ditches from washing. It is business to haul out and scatter all the manure. By keeping all little jobs done and out of the way as soon as they present themselves, we can easily keep our work up in first-class condition.

It is business to have the best of seed, stock or help. Anything that is poor grade cannot produce good grade of crops or results. In hiring a man get a dependable, intelligent one that does not need to be told everything; one who can take the lead and run the business should you be ill or away.

Sanitary Remodeling of Dairy Barns.

(Continued from page 337)

up air out; second, get pure, fresh air in.

Many farmers are doing the second but not the first, yet if the stable is constructed rightly, made as close and tight as it should be and the foul air taken out, the fresh air from the outside can hardly be prevented from rushing in. It is much better to provide for letting this pure air in, instead of letting it come through cracks; in so doing the warmth of the cow is regulated.

Nearly every farmer has heard of the King system of ventilation but few understand its essential requirements to make it work. Nearly every one knows that a room containing a fire-place is easily ventilated when with double windows the outer window is opened a little at the bottom, and the inner window at the top in winter. The foul air containing gases breathed out settles near the floor while the animal heated air rises. Fresh air let in at the top of a room mixes with the warm air and gradually forces the impure air out at the bottom. In the living room this is done by the way of fireplaces and chimney.

In the cow barn inlets or intakes must be so arranged that the warm air will not pass out instead of cool fresh air coming in. This is done by having the inlet flues begin near the ground on the outside and end near the ceiling on the inside. Inlets should be numerous, well distributed and of small size on all sides of the stable. Usually an inlet 4x12 inches is convenient because it can be built between two 4 inch studs.

Usually about 10 to 12 of these inlets should furnish air enough, if properly situated, for 20 cows. Flues should be well lined with building paper and matched boards to prevent side leaks. Openings to the outside should be screened.

Outlets should be large and open near the floor with extension enough above the barn to cause a good draught upwards. An outlet 2 feet square should be sufficient for about 20 cows. This should be built of wood instead of metal as warm air may condense near the outer end and cause moisture to gather. When more cows are in the stable a flue at each end gives better results. The mistake of not getting the outer end of the flue high enough is often made. To produce a draught and allow oxygen to enter, involves the same principle as exists when large factories and mills build tall chimneys for furnaces.

Figs. 1 and 2 diagrams show some of the adaptations of the King system.

Figure 1 shows two methods of constructing the inlets, between the studding of the wall and entirely inside the stable. a and b are inlet flues through which the fresh air is taken in at the bottom and outside of the building and enters in at the ceiling or top of the stable on the inside. c is where the cold impure air is lifted by the long air shaft or flue that extends to the roof of the barn. d is a damper or opening that can be regulated by opening or closing to let off gases or hot air if the stable should be too warm. g is where the shaft passes through the roof of the barn.

Figure 2 shows the proper method of building the inlet flue through a brick or stone wall in a basement barn. a is the intake flue at the lower part of basement on outside which passes through and between brick wall and enters stable on inside at ceiling, letting in the fresh air. b is the inlet flue that also takes in the fresh air at the ground level and has a drop on the outside of wall and passes through and rises about the same distance as the drop on the outside in order to allow the inlet on inside of wall to be close to the ceiling of stable. c and d as explained for Figure 1 are the out-take flues at floor and damper at ceiling of stable.

LIGHT.

Too much stress cannot be laid on the fact that sunlight is one of the best and perhaps the cheapest of disinfectants.

In the construction of dairy barns one cannot help noticing that there is a decided lack of window space even in the home of noted herds.

Recently a well known dairyman lost nineteen valuable cows from tuberculosis, but no one could wonder at it after visiting the dark, poorly ventilated quarters. The stable was disinfected and the man filled up the vacant places with more cows but failed to even whitewash the place. Doubtless he will have future trouble, whereas if a few windows had been cut in the side of the barn, a proper ventilating system established, and whitewash freely used, trouble would be avoided.

That four square feet of eight per cow should be required is not asking too much.

In many of our present dairy barns

Fig. 3. Dairy Barn Poorly Lighted.

Fig. 4. Dairy Barn, showing a large window space for entrance of light. in contrast with Fig. 4.

where there is insufficient light, the present windows can be made larger and fitted to the sliding type or those hinged at the bottom. Necessarily all windows must be tight to insure an efficient ventilation system.

Often there is some hesitation for fear that too many windows will make the tieup too cold but when the cellar is closed and all doors tight and the ventilating system working properly this is a rare occurrence.

When windows are cut in or enlarged, their length should exceed their width and inside sills be avoided.

Together with more sunlight there should be in every dairy barn a coating of light paint or of whitewash to make the place look more like a milk-producing station and to insure against dirt and bacteria.

In order to have a good coating surface the walls and especially the ceiling should be smooth. Preferably the ceiling should be of matched boards to prevent hayseed or chaff from sifting through on to the animals and into the milk pail.

Whitewash should be applied at least once a year and could be applied more often to good effect.

If ordinary small windows are present in the barn, it is no difficult task to widen them to the next upright joist or to the second one from the present opening. After this, window frames can be adjusted. Windows as large as the ordinary house sashes have been placed lengthwise at intervals in openings cut, and great satisfaction has resulted. The only objection to large areas of glass in the stable is the rapid cooling and condensation on very cold nights, but this can be largely overcome by the use of double glazed windows in winter. As has been stated, instances of too much light in a dairy stable are very rare.

STALLS OR STANCHIONS.

The demand for pure milk produced under sanitary conditions is constantly increasing, and to produce such milk it is necessary to have clean cows kept in sanitary stalls in sanitary barns.

There seems to be a prevailing impression that a sanitary stall or stanchion is an expensive patented arrangement, beyond the reach of the average dairyman, but from what follows it can be seen that any one handy with tools can accomplish excellent results.

Most of the older dairy barns and some of the new ones are so arranged that it is impossible to keep cows clean in them. Many systems of fastening, such as ties, rigid and swinging stanchions, stalls and the open shed are being used but the best are, of course, those which will keep the animal comfortable and from lying in her own filth. In stall construction one should bear in mind:

1. It should keep the cow clean and allow plenty of light.
2. It should make the cow comfortable.
3. It should be convenient for feeding, milking and cleaning.
4. It should hold the animals securely.
5. It should be inexpensive.

The stall shown in Fig. 6 is not provided with any special method of feeding hay, as may be wished for by some. This can be accomplished

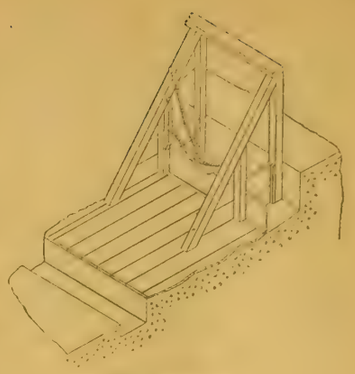

Fig. 6 Sanitary Stall.

by adding a hay and roughage rack, with but little expense. These types have been selected for suggestions because of their simplicity, sanitary features and low cost. The bill of cost for a stall of Fig. 6 type will differ in many sections, but a conservative estimate for ten stalls follows:

Crossbars 36 feet, of 2x6 in. 12 ft. lengths, @ $25 per M	$0.90
Mangers 72 ft, of 2x12 in 12 ft. lengths, @ $34 per M	2.45
Manger and partitions 30 ft. of 1x9 in. 12 and 16 ft. lengehs, @ $35 per M	1.00
Floor mats, 158 feet of 1x12 in., 18 ft. lengths, @ $37 per M	5.85
Uprights and partitions, 224 feet, of 4x4 in. 12 ft. lengths, @ $35 per M	1.00
Chains, 10 @ 35 cents each	3.50
Guide for chains, 10 @ 20 cents	2.00
Bolts for holding partitions in concrete floor, 11 @ 10c	1.10
Nails	2.00
Labor	20.00
Total	$45.97
Cost of single stall, approximately	4.59

Several firms frequently advertise stable fittings in the columns of the Maritime Farmer and readers who contemplate remodelling their stables should write for catalogues and prices.

At present on many of our dairy farms the old form of manger or box crib is in use. It is difficult to clean and when not cleaned its corners become caked and gummed with waste grain from many feedings. To require an animal to eat from such an ill smelling, constantly used, unsanitary feed box is wrong, if the animal is to be healthy and productive. The box manger is gradually being eliminated, or reconstructed to make conditions more sanitary and the manger more durable, and to this end concrete is being used.

Many questions arise as to the type of manger to be used when building or remodelling a barn. Some desire a trough made of plank or of cement curved at the bottom, running the length of the tie-up. This can be flushed with water and cleaned often. Partitions are desirable between animals when one animal is apt to steal some of another's grain.

By using individual drinking pots, by flushing the trough, and by using tanks in the barn the cattle can be watered, but when weather permits it is much better to allow them to exercise in the barnyard and drink from a water tank there. This insures a little needed exercise and eliminates cost of unnecessary stable fixtures. Types of cement mangers in use and giving satisfaction follow.

(Continued on page 368)

HORTICULTURE.

Impressions of the Annual Convention of the Fruit Growers' Association of Nova Scotia Held Last Month in Middleton.

If, as Aristotle asserts, "Agriculture lies at the basis of national prosperity," and, of course, horticulture is the basic agricultural enterprise in the Annapolis Valley,—the projected "Black fox ranch" not excepted, at present,—therefore Pomology, particularly apple-culture, is the keystone in the arch of prosperity in that part of Nova Scotia lying between Windsor and Digby. The biggest thing above ground in this fruit belt, next to humanity, is the apple.

Moreover, one has regard to the fact that the fruit growers themselves are now appreciating the desirability ity, and when marketed, shall not of producing fruit of the finest qualsuffer in comparison with the best of Ontario and other apple-growing districts.

In view of the foregoing facts, it was very natural that Middleton should be for three days last week the Mecca of the Pomologists of N S.

They literally poured into that town from all points of the compass. Every station along the line furnished its quota. The members of the local committee had a big contract on their hands, but they were equal to the occasion, and very soon had all the visitors revelling in that hospitality for which Middleton is famous. Once within the convenient and commodius hall where the Convention convened at 2 o'clock on Tuesday afternoon, one was impressed with the type of men, representative of this "backbone" industry of western Nova Scotia.

Men of all ages, and all sizes were there. After "taking in" the personnel of the Convention, and getting my first impressions, my mind reverted to the primary cause of this splendid gathering—the apple—The king of fruits is the apple. Man the kind of all things created. God the great "First Cause." There flashed across my mind the saying of the poet,

"Thy providence is kind and large,
Both man and beast Thy bounty share;
The whole creation is Thy charge,
But men are Thy peculiar care."

Consider the apple, how it grows, from within, characteristic of the inward growth in grace of men. In some respects men outwardly resemble the trees in their orchards. These trees typify the physical. characteristics of those who live and labor under their shade and shadow. In the midst of my reverie the President proceeded to open the Convention.

As Chairman, Mr. S. C. Parker is the right man in the right place, and in re-electing him President, his brother fruit growers honored themselves in honoring him. His address was timely. In listening to Dr. Matheson speaking on the subject—"The San Jose Scale Situation in Nova Scotia," one could not but feel that in the person of this youthful-looking Entomologist we have secured a man well qualified to lead us in our campaign against the curse of the apple industry, the orchard pests. In view of what Dr. Matheson said, I have come to the conclusion that it will be safer for our apple growers to grow their own nursery stock, rather than import infested stock. And, why not?

By so doing the introduction of dangerous pests will be avoided, scions and buds from trees thoroughly acclimated could be obtained, there will be no injury done the young stock in consequence of long transportation, and the orchardist could have his trees grown from scions from his own favorite trees, I regard this as a very important matter. It is as essential to have good nursery trees as to have good seed.

Prof. Saxby Blair, and Mr. R. S. Eaton, than whom there are no better authorities in the Maritime Provinces, handled the subject of box packing.

We were all impressed with the fact that the box is undoubtedly the ideal package for apples of the finest quality. The advantages certainly counter-balance the disadvantages.

The Canadian Trade commissioner, at Leeds, Eng., reports that one of the important changes which the past season's trade in Canadian apples has brought to light is the greatly improved popularity of box-packed apples. Many merchants now declare themselves to be whole-heartedly in favor of this system of packing apples in bushel boxes. Not only are these boxes, they say, more conveniently stored on the ship, but they are easier to handle in their warehouses, and meet a long felt want in supplying the demands of small retailers who cannot dispose quickly of the larger amount of apples contained in the ordinary barrel.

The box makes it possible for the grower to place his fruit in the hands of the consumer in the original package. In the great majority of instances the barrel is opened by the retailer, and its contents sold in small quantities. However, until our packers become experts in this art it would be, I think, a mistake to compete in this respect with B. C.

The fruit growers of that province certainly have a mortgage on the different styles of pack, as far as Canada is concerned. Mr. J. Elliot Smith suggests that a box packing expert be engaged for the "Short Course" which is held each year at the College in Truro. His suggestion is seasonable. Or, better still, with Messrs. Saxby Blair and J. M. Robinson at Kentville, why not inaugurate a course there to include packing in all its phases? It is conceded that the bushel box is a more attractive package than the barrel, and with the fancy stock suitably wrapped in tissue paper, marked with the name of the grower and the variety of the fruit, our highly colored fruit of uniform size will command prices at least as high as that paid for oranges. I do not know how much of truth there is in the statement which I read some time ago that apples are greater luxuries in New York than oranges. While single oranges of the finest variety can be bought for 5 cents, the best apples are being sold for 12 cents each.

It appears that there is a difference of opinion in regard to the size of the box. The majority however, recommend 20 inches long, by 11 wide, and 10 deep, inside measure. The bushel basket, I understand, is popular in some quarters. It is easily handled and pleases the customers.

This package however is used only in shipping to markets adjacent to the orchard where the fruit is grown, and even there, only to a limited extent.

I noted that the speakers advocated the use of a press, yet there are those who are of the opinion that to press too hard is a mistake, and affirm that the knee will give sufficient pressure. To sum up, just as soon as the demand for boxed fruit becomes general we shall have to adapt our methods to that situation. In the meantime we shall make no mistake in packing our finest apples in boxes. The old adage "The best goods are put up in the smallest packages," or words to that effect, can be made to apply to apple packing; "the better the grade, the smaller the package." Here is a concrete case copied from the "Montreal Witness" of recent date,—

FANCY NO. 1 NORTHERN SPY APPLES IN BUSHEL BOXES.

We have just received another large shipment of extra fine quality No. 1 Northern Spy apples, in bushel boxes, suitable for family use. Each apple is wrapped separately in paper and they will keep for months in a cool place. Price $3.00 per box.

The two masterful addresses by Prof. J. P. Stewart made us his debtors. "Orchard Fertilizers" was a splendid effort. Unless the soil is properly cared for, we shall look in vain for profitable returns. Apples are in greater need of fertilization than many other crops. In judging the value of a fertilizer it is necessary to consider not only the total amount of phosphoric acid, potash, and nitrogen which it contains, but also the proportion of these constituents which the apples and leaves are able to utilize readily.

After all has been said that can be said in favor of commercial fertilizers, barnyard manure is of all fertilizers the most desirable.

In regard to humus, Wolverton "The Canadian Apple Growers' Guide" says that while humus is valuable upon dry soils, helping them to retain moisture, it may be injurious upon wet soils, tending to make them boggy and cold. For example it would not be wise to apply marsh mud to clay soil. To put the whole matter in the proverbial "nut-shell," I would say; the amount of fertilizer to apply depends upon the character of the soil, the age and vigor of the trees, and the quality or quantity o the fruit desired. My motto in this connection is, "Fertilize to make the orchard profitable." The gist of the Prof's teaching was to fertilize, whether you cover crop or not, and though you may reduce your cultivation of the soil to a minimum, it is fundamental to fertilize.

In speaking to us on "Sprays and Spraying" Prof. Stewart proved himself to be master of his subject. I should not be doing the Prof. justice if I were to endeavor to condense an address that might be termed a "classic" on the subject of spraying, into a few sentences. I therefore refrain from an extended allusion to an address that was a veritable mine of information. Our belief, (1) in spraying, (2) in lime-sulphur, and (3) the two important sprayings, to be on no account omitted, (a) before the buds burst, and (b) immediately after the fall of the blossoms, is, in consequence ol this exposition on the above subject, most completely confirmed. If we wish to grow the best apples our orchards can produce let us resolve to make that possible by spraying and thinning. Gossard suggests that "the essentials for success are a good outfit, the applications at the proper time, and thorough work."

If I desire to grow the best commercial apples, can I afford not to spray?

Our honored visitor, after giving us the benefit of his own investigations and experiments, reminded us that the care of both land and trees was a local problem. Each grower for himself must employ the means and methods best adapted to local conditions. And right here is a moral that we had better take to heart, in view of our characteristic proneness to "List" the place, hoping to sell and buy another. Stand by the orchard that you have studied, and know the peculiar nature of the soil and the trees. Although the hour was late we were reluctant to allow the learned speaker to take his seat.

The entire audience, from that veteran apple connoisseur, Mr. R. W. Starr, down to the greenhorn whose privilege it was to sit at the feet of such a Gamaliel, and whose pleasure it is to pen these few lines, was greatly edified.

I regretted the evident haste on the part of some to amend the "Fruit Marks Act." It seems to me that any move in that direction should either be referred to a committee, or a notice of motion given some time prior to the discussion. The authors of the resolution, doubtless did not designedly aim at lowering the present standard, yet, as several speakers remarked, had it passed, it would have exposed us to criticism.

I can quite understand that the law requires "not less than 90 per cent of the fruit free from defect" allowing for inferior apples inadvertantly packed. I think perhaps the most indefinite clause in the Act is the one that says the fruit shall be "properly packed." The term "properly" is not strong enough; is not sufficiently emphatic; allows too wide a margin. However, that is only my opinion.

I refrain from expressing my mind in regard to "The Future of Our Horticultural Exhibition" as I have not given the matter adequate consideration, in view of its importance.

We are all very much gratified with the statements of Messrs. W. W. Moore, and C. W. Baxter, from whom we learned of the marked improvement in packing during the past season. Until this change for the better took place we were gaining an unenviable reputation as apple packers.

It pays to be honest. The old adage, "Honesty is the best policy," certainly applies to fruit growers as it does to all other industries.

Let us guarantee that our apples shall be perfectly graded and packed, and merit a reputation for honesty. With external conditions approaching the ideal, why should not Nova Scotia be second to none as an apple producing country?

I had retired from the Convention before the following subjects came up for discussion: "The Brown Tail and the Gipsy Moth," and "Thinning Apples on a Commercial Basis." I presume, however, as a result of the conference on the latter subject, every member of the Association went home a convert to thinning. I shall close impressions by asserting that the secret of success in growing No. 1's is (1) Fertilize, (2) Spray and (3) Thin. By so doing you will, I am convinced, increase the size, improve the quality, brighten the color of your apples, reduce the cost of harvesting, protect your trees from overbearing, and enhance the value of your crop. In other words, you will have more No. 1 and less No. 2 and 3, to pick and pack.

G. Bryant,
Berwick, E. S. Feb. 3rd, 1913.

Something Doing in the East as Well as in the West.

We have all grown accustomed to looking on the West and westerners as the place and people of progress. This attitude of mind may account for the little notice taken and the small appreciation of what is being done all about us.

Co-operation is now a household word. We cannot take up a paper without reading something of the grain growers of western Canada the fruit exchange of California, the grape growers of Michigan or of some other body of producers that all at once seem to have come to the conclusion that in union there is strength. And we in Nova Scotia, Although we do live in the East, should not forget that in our own co-operative body, "The United Fruit Companies," we have the first organization of its kind in America dealing exclusively in apples.

Even the great and pushing West, only this winter has seen the wisdom of calling representatives of her co-operative fruit companies together to form a central union. This past year has been a bad year for them. The

Bad Blood

is the direct and inevitable result of irregular or constipated bowels and clogged-up kidneys and skin. The undigested food and other waste matter which is allowed to accumulate poisons the blood and the whole system. Dr. Morse's Indian Root Pills act directly on the bowels, regulating them—on the kidneys, giving them ease and strength to properly filter the blood—and on the skin, opening up the pores. Profitable crops every year

HOW?

Farmers nowadays are able to get rid of much uncertainty in growing their crops. Good yields can be secured in spite of weather conditions that once were regarded as hopeless;—one essential aid to a dependable crop is a dependable fertilizer. In a good season it means a big success; in a bad season it prevents failure. Therefore, use

Bowker's Fertilizers

Bowker's Fertilizers are soluble, active, sure. They are backed by forty years of experience, the best materials, the best facilities and prompt service. Suitable for every crop and adapted to every pocketbook.

We want Agents in unoccupied territory. Write today for prices and terms; this may mean a good business for you if you act at once.

Write anyway for our illustrated catalogue and calendar before you buy your spring fertilizer. We want you to know what we can do.

BOWKER FERTILIZER COMPANY

76 Lyman Street, Buffalo, N. Y. 42 Chatham Street, Boston, Mass.

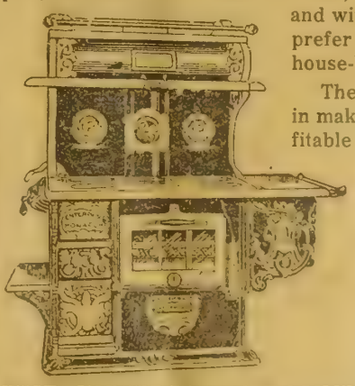
Original and largest manufacturers of special fertilizers.

IF EVERY SUFFRAGETTE IN ENGLAND

HAD A HOME, AND IN IT A STEEL RANGE LIKE THE

ENTERPRISE MONARCH

and could know the delights of cooking delicious bread and cake, crisp pies, meats and fish "done to a turn," without odors from burned food, and with the minimum of labour she would prefer being a house-keeper instead of a house-breaker, every time.



The "MONARCH" leads all competitors in making housekeeping pleasant and profitable and divesting it of much drudgery--BECAUSE it has all the good features of other ranges and some that are distinctly its own.

Then it is backed by our written guarantee as to fit finish and operation.

It will pay you to write us for circular and particulars, if your dealer does not handle this well-known range.

THE ENTERPRISE FOUNDRY CO., Sackville, N. B.

MANUFACTURERS

fierce competition between their small companies with increasing crops, has been the buyers opportunity. Our Nova Scotia companies scented this danger afar off, and did not need to have it forced on their attention by bitter experience. We only have to listen to the wails of some of the apple speculators in the public press, or to hear the arguments advanced by the agents of English Commission Houses against the United Fruit Companies to understand what a good work they are doing. The criticism of high salaries was quite potent for a while to use on the uninformed, but when it was found that all expenses of running the "Central" would be met by small economies effected by organization, it made that cry look rather foolish.

It may interest some to know that a gross sale of thirteen shillings in London now nets the United Fruit Companies two dollars a barrel. Individuals in shipping know that it takes fourteen shillings gross to net them two dollars. There is a clear twenty-five cents a barrel saved to Nova Scotia; and this amounts to the snug sum of $100.000 on 400,000 barrels, the estimated shipments of the Companies this year. This shilling a barrel is clean, legtimate money that could never come to the growers except through organization.

Mr. W. W. Moore, of Ottawa, Chief of the Market Division, addressing the Nova Scotia Fruit Growers' Association at Middleton, was most flattering in his remarks on how co-operative packed apples had been received this year in foreign markets. He read letter after letter from Great Britain, Montreal, and Western Canada speaking in the highest terms of the goods received from the United Fruit Companies.

This testimony was all the more valuable coming as it did from Mr. Moore, who last year speaking before the same body at Wolfville, created quite a furor by roundly scoring Nova Scotia shippers, for sending, that year, apples fraudulently marked and packed to the markets of Western Canada.

Our fruit growers now appreciate that conditions in the apple world are rapidly changing. It is only half the business to produce the supplies. A coal mine would be of no value unless its product could be placed on the market and sold at a profit.

With the production of apples increasing so rapidly the marketing end of the business is assuming even greater importance.

The spread between what the grower gets and what the consumer pays is far too great to encourage either. Early apples retail in Sydney, C. B. at three pounds for a quarter; this is at the rate of ten dollars a barrel. The farmer in the Valley receives $1.50 a barrel for the same apples and out of that pays for the package. This condition of affairs curtails consumption, thus reacting on the producer in limiting his market.

With co-operation new markets can be found and old ones catered to. Certain varieties, as Gravenstein, Wagner, Cox's Orange, etc. could be handled in boxes at greatly increased prices. Only in co-operation can this phase of the business be properly developed. The principles in this movement are as sound as the ten commandments, but the detail must be worked out to suit the peculiar conditions of each locality. Faith and perseverance are bound to succeed.—M. K. E.

DAIRYING.

Milk And Cream Testing

The subject of testing milk and cream implies the separation of butter fat from milk or cream, which the Babcock Test has made possible, by the difference between the specific gravity of butter fat and milk serum by the centrifugal force produced in the tester and by burning the solids not fat with a strong acid.

It is necessary to test milk or cream in order to find out its commercial value. The percentages of the different constituents of milk especially fat and casein will differ considerably in different milks and for this reason we must have some means of knowing the extent of this variation. In the manufacture of cheese, fat and casein are used, and to know the true value of the milk for this purpose we must know the amount of fat and casein which the milk contains. If for butter making, the fat of the milk will be the index of its value for it is the fat alone that is used in the manufacture of butter. It can easily be seen that a rapid, accurate, inexpensive and reliable test would be of great value to dairymen. The Babcock test has proved itself to have the above mentioned qualities.

In testing milk, cream, skimmed milk, buttermilk or whey much the same method is followed and naturally the first step taken is getting a fair sample of what is to be tested. These samples should be taken immediately after the milk or cream has been emptied into the receiving can. The contents of the can should be thoroughly stirred. The simplest and most used method of taking samples is by using a half ounce dipper. This sample taken is put in a pint, or half pint, glass jar and is kept with some preservative for a period of two weeks or a month when it is tested. This kind of samples are called composite samples and are generally used in factories and creameries.

These composite sample bottles should be kept well corked either with a wooden glass, or cork stopper. Open bottles are almost certain to affect the test and in butter the the over run. It is also better to keep these samples in a dark, cool place as heat and direct light tend to evaporation.

When these samples are to be tested, they should be placed in warm water and brought up to a temperature of 105 degrees—110 degrees. If the samples were tested daily, a much lower temperature would be better, say 65 degrees to 75 degrees. For taking a test sample, the pipete is used for milk or thin cream. This will deliver 17.5 c. c. For daily testing use about 17.5 c. c. of Sulphuric Acid for each bottle. This acid should have a strength of 1.82 to 1.83. Do not allow the acid to drop direct into the milk or cream, but rather run down the inside of the bottle. In testing composite samples, less acid is used and heavy cream should be weighed with a scale instead of measuring with a pipete.

As most creameries and factories have 24 bottle machines, it is usual to measure or weigh out the 24 samples before placing in the machine. It is well, now, to place the bottles in cold water for a minute or two so as to bring all to the same temperature. The acid is now added, the case containing the bottles is shaken with a rotary motion to mix the contents. As each bottle is placed in the machine, it should be given another shake. The bottles are now whir,ed in the tester at full speed for five minutes, then enough hot water is added to float the fat up into the neck. The water should have a temperature of 140 degrees to 160 degrees. Whirl two minutes more, now place the bottles in hot water at about 140 degrees, that reaches to the top of the fat and let stand for a few minutes, then read.

In testing cream, add hot water immediately after placing in machine, enough to bring the contents up nearly to the bottom of the neck. Then whirl five minutes, add more hot water, whirl again, place in hot water, same as milk samples and read two or three minutes later.

For reading, a small pair of dividers are used. It will be noticed that in both milk and cream tests, that there is a distinct curve or cresent at the top of the fat column and a less distinct curve at the bottom. For reading milk tests, the reading should be from the lowest extremity to the highest extremity of the fat column. For cream read from the bottom of the fat column to the lowest part of the curve on top.

The tests should be read twice to avoid all danger of mistakes.

While the Babcock test is very simple, great care should be taken that each step is accurately carried out. Unless this is done the test is practically of no use.

A few pointers regarding testing might not be out of place. Be sure your bottles and glassware are thoroughly cleaned. Hot water and some good cleanser, such as Whyandotte, with a small brush is all that is necessary to do this.

Be sure your temperatures are right, also know that your acid is neither too weak nor too strong.

Be sure your tester runs smoothly and does not jar and see that it runs at right speed.

Do not allow samples to become cold before reading.

Soft water is much better to add to the tests than hard water.

REGAL Flour yields the *best quality* and the *utmost quantity* of bread per barrel: white, light loaves, pastry of melting flakiness.

This is simple direct truth.

Unless you find it so, when you try it, your dealer will return your money.

Farmer Ads Are Business Getters

A few drops of sulphuric acid added to hard water will help very much.—Read before the Nova Scotia Dairymen's Convention, Truro, January 10, 1913, by G. A. MacKenzie, Scotsburn, N. S.

Some of The Advantages of Winter Dairying

In opening up the subject of Winter Dairying, I do not purpose taking up much of your time, but will endeavor to point out some of its advantages.

In doing so, I suppose, it is natural for us to look at it from the standpoint of a Creamery Manager. Winter is the season when creameries have the most difficulty in getting a sufficient supply of milk or cream to keep the factory up to its capacity also causes the loss of a certain and a lessening of the milk supply affects the economical manufacture of butter. It makes it impossible to supply the demand for butter at the season when the price is highest and amount of trade for the summer months when butter is plenty and lower in price.

But is is from the point of view of the farmer that the missionary work needs to be done as I believe the average creamery manager realizes the importance of a good supply of milk in winter as well as summer.

The first advantage I would point out is that by having the cow freshen in the fall she will, with proper care and feeding, produce more milk and butter in a year than by freshening in the spring. If a cow freshens in November or December she can remain in the stable for the winter and she has six or seven months when she can be made to produce more milk than in any other equal period of the year. Extensive experiments conducted along this line by one of the U. S. Experimental Stations shows that cows that freshen in from December to February, give a larger amount of milk in a year than those freshening at any other time and that those along in April gave the smallest amount.

Another advatage is that the farmer has more time to care for the cows in winter. In the summer time the sowing, cultivating, and harvesting of the field crops makes a rush of work when labor is scarce and high. At this time the dairy cow is not likely to get as good care as in winter when help is cheaper and more easily secured.

Winter dairying would help solve the help question as it would even up the work making it less in summer and more in winter and thus enable the farmer to keep his help all the year.

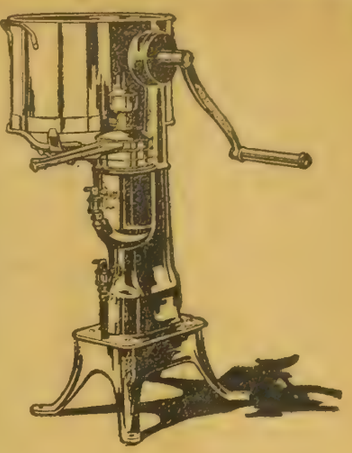
Winter is also the best time for raising calves as the farmer is around the barn more and will notice how the calves are thriving and will give them more attention. By the time the calf is six or seven months, the grass is good and the calf can be turned out to pasture and will be about a year old before it is put on dry hay.

There is also the advantage of the higher prices of milk and milk products in winter and if milk or cream is supplied to a creamery it is not necessary to deliver as often as in summer.

Winter dairying also builds up the farm owing to the larger amount of bran, middlings, corn meal, linseed and oil cake fed to cows. The manure from these cows contains large amounts of valuable fertilizing elements which go out in the fields and mean large crops next year.

For a sprain you will find Chamberlain's liniment excellent. It allays the pain, and soon restores the parts to a healthy condition. 25 and 50 cent bottles for sale by all dealers.

Pay the Price of the Best —No More—No Less



ECONOMY in buying a cream separator does not begin nor end with the price. You may easily pay too little and just as easily pay too much.

Learn the difference between gears that work without back lash and those that have it or develop it soon. Learn the importance of a self-adjusting bowl spindle bearing, and learn to know one when you see it. Discover the difference between brass and phosphor bronze as a material for bearings. Buy a separator with an oiling system that cannot fail you even for a few minutes of a run. When you find the separator that comes up to your specifications—one that with proper care will do good work for a long time—buy it. You will find it marked

I H C Cream Separator Dairymaid or Bluebell

I H C cream separators turn easily and they are easy to run because the working parts are accurately made and the bearings are sufficiently lubricated. The shafts and spindle are the strongest used in any separator. The shaft and spindle bearings are supported by the frame, but have no contact with it. The contact is between the steel spindles and phosphor bronze bushings. The gears are spirally cut so that there is no lost motion between them. They are entirely protected from grit and milk, and at the same time are easily accessible for cleaning.

See the I H C local agent and ask him to give you a demonstration of the efficiency of the machine as a skimmer and to go over with you and explain carefully all of its good, mechanical points. You can get catalogues and full information from him, or, write the nearest branch house.

1913 SESSION

MARCH 20th to APRIL 10th

Courses in

Cheese-making
Butter-making
Milk Testing

C. W. McDOUGALL,
Superintendent.

The N. B. Farmers and Dairymen in Annual Session.

(Continued from page 339)

try is not being carried on extensively enough to meet the home demands. Moreover, he said the standard of quality must be improved if we are to sustain our fair reputation as an agricultural country. Not only is there a shortage of supply but a deplorable loss in quality.

It is important for the credit of the Dominion that the present standard on which poultry are judged be changed. If we are to meet the national requirements of the poultry industry as a whole there is need for better eggs and poultry. The poultry division of live stock department is endeavoring in a scheme for the reconstruction of the poultry industry to substitute for the present one, a standard which will be for the betterment of the whole trade.

Never before had the farmer such oppottunities for a profitable sideline as poultry raising offers today. It is peculiar, but true, that the large centres of New Brunswick in the heart of a rich agricultural province not only depend on the outside for their needs, but in more than one instance the supply from the West was instrumental in preventing an egg panic. From 55 per cent. to 60 per cent. of the egg consumption in St. John were imported from outside the province.

While the situation is one to cause serious reflection it is not irremediable. Farmers have as an incentive to more extensive operations in this line, the knowledge that not only do better prices than ever prevail, the opening up of foreign markets, but the fact that eggs and poultry are becoming a more staple article of foodstuff. In Canada 25,000,000 dozen more eggs are consumed now than 10 years ago.

Co-operation work in farming communities will solve the scarcity of supply and raise the standrad of quality. This means the creation of egg circles in every community, co-operation in the purchase of food, thus overcoming the past obstacle to poultry raising, the cost of feeding. Besides, under this scheme of working together they could improve their chances in marketing and by establishing a common incubator of large proportions, would solve successfully another difficulty met with in the past.

He also advised for the benefit of the dressed poultry trade, a modern central killing plant to be established by the poultry men jointly. The killing and dressing having an important bearing on the price, and requiring skill, a central plant in charge of a skilled person would have beneficial results.

New Brunswick has grand openings in the poultry line and carried on according to the approved method, can be made a lucrative industry. The government is giving the matter more serious thought than in the past and providing assistance by instructional work and by means of the personal missionary work of poultry experts sent out by the department.

Provincial Poultry Superintendent Jones led off in the discussion of Prof. Brown's address. He pointed out that too much attention could not be paid to the selection of the male line of poultry mating, as the sire influenced the production of eggs in the pullets of his offspring to a much larger extent that the female line, but to get best results we must pay attention to both lines. He advised great care in the selection of individuals, and said that controlled matings were giving the best results obtained. It was only by the most rigid selection could we retain stamina, health and vigor, that was most needed for heavy egg production.

Prof. Cox, of the U. N. B., gave a most interesting and instructive account of how he managed his flock to get the grand results he has been getting the past two winters. He attributes his success to selection of the earliest and best layers that respond to stimulating foods. Bu selection, good feeding, keeping them in warm, wholesome quarters he increased the egg production of his flock in the two and one-half months' of the year over last year, from 1698 eggs to 2529. He said it certainly paid to use the greatest care in breeding and feeding.

OFFICERS.

President—W. H. Moore, Scotch Lake.

Vice-President—J. A. Bernier, Edmunston.

Receiving Secretary—T. Edwin Carter, Bathurst.

Corresponding Secretary—M. A. Scovil, Gagetown.

Treasurer—H. H. Smith, Hoyt Station.

COUNTY VICE-PRESIDENTS.

Albert—Lewis Smith, Lower Coverdale.

Northumberland —Henry Gordon, Chatham.

Queens—Thomas Harding, Welsford.

Restigouche—John McKinnon, Dundee.

St. John City and County—R. G. Murray, St. John.

Sunbury—M. A. Smith, Hoyt Station.

Victoria—J. W. Stevenson, Upper Kimtore.

Westmorland—R. H. Welling, Shediac.

York—Edward Jarvis, Stanley.

Following are resolutions passed:

WHEREAS, the deamnd of the farmers of the Province of New Brunswick for a better road system is apparent, and

WHEREAS, the amount of money at present expended for road purposes is being in many cases, injudiciously used to meet these demands, and

WHEREAS, the Convention at St. John passed a resolution that a large sum be expended to build three Trunk Lines parallel to the railroad through the aforesaid Province, which resolution was passed in direct opposition to the rural delegates.

THEREFORE RESOLVED, that this Association protest against such a resolution, and recommend that such amounts as granted be expended so as to give equal privileges to the farmers living in remote districts as against those more adjacent to the railroads.

* * * *

WHEREAS, our farmers in order to extend their operations believe that it is necessary to use a considerable amount of commercial fertilizer, and

WHEREAS, the cost of such fertilizers are so high that it is about impossible to use them with profit,

THEREFORE RESOLVED, that in the opinion of this convention of Agriculturists from every County of New Brunswick, that it is desirable that our Government take such steps as are necessary to furnish the farmers with the chemicals for that purpose at first cost.

* * * *

WHEREAS, in order to demonstrate to the masses of farmers of the Province the advantage of Scientific Agricultural Education, and as the Government has taken steps to establish two Agricultural Schools and an Experimental Farm, which we heartily endorse,

THEREFORE RESOLVED, that it is the opinion of this Association that it would very materially further the cause of Agricultural Education by the establishment of Demonstration Farms in all the Parishes throughout the Agricultural Districts of the Province.

AND BE IT FURTHER RESOLVED, that [illegible]ully appreciate and understand the elementary principles involved in such an education, that there be established on the curriculum of the Public Schools of our Province a system of Agricultural training.

* * * *

WHEREAS the present system of under-drainage for farm purposes is carried on by means of manual labor and

WHEREAS, owing to the high cost of labor this practice is both slow and expensive and,

WHEREAS, it is desirable to extend the policy of drainage, and render it more efficient and less costly and,

WHEREAS, machines are manufactured in the United States that will do drainage work efficiently and at greatly reduced cost, and

WHEREAS, there are none of these machines manufactured in Canada,

THEREFORE BE IT RESOLVED, that this Association ask that the Governor-General in Council at Ottawa be requested to cancel the duty on such machines.

* * * *

WHEREAS, the members of the Farmers and Dairymen's Association in Convention at Fredericton regret to learn of the serious illness of Mr. Bliss M. Fawcell who has been an active member for many years.

THEREFORE RESOLVED, that this Association express their sincere

Rich AND Mellow

Will You Have This Handy Electric Light on Your Farm?

When you want to find out quick what's causing the row in the stalles, don't waste time over the lantern. Just grab up the little "Nine Lives" Electric Flashlight and run.

When you meet another rig on a pitch dark night, the "Nine Lives" will show you what you are doing. Same thing when anything goes wrong with the harness, or the automobile. Just pull the

"Nine Lives" Electric Flashlight

out of your pocket, press the button and you have a bright light just where you want it. There are hundreds of times when it will more than come in handy.

The wonderful new Tungsten Incandescent Lamp supplied with current from the three Dry Batteries, gives a surprisingly bright light, which is concentrated by the lens into a powerful beam. Batteries hold their strength four times as long as any other dry cells, and can be renewed for a trifle.

Don't be without this modern convenience. Send $1.50 or $2.00 according to style you prefer and we will send it carefully packed and fully prepaid.

Suffered With Kidney Trouble
For Ten Years.

Those who have never been troubled with kidney trouble do not know the suffering and misery which those afflicted undergo.

Weak, lame or aching back comes from the kidneys, and when the kidneys are out of order the whole system becomes deranged.

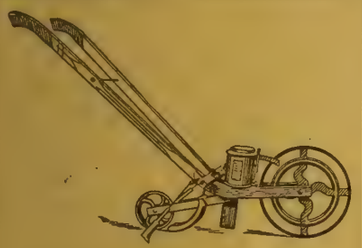
Doan's Kidney Pills go right to the seat of the trouble, and make their action regular and natural.

Miss Mary Daley, Pennfield Ridge, N.B., writes:—"I now take great pleasure in expressing myself for the benefit I have obtained from your wonderful medicine, Doan's Kidney Pills. Having been a sufferer with kidney trouble for the last ten years, and having spent hundreds of dollars in the so-called 'Quack' cures, from which I derived no benefit whatever, and after having been advised to try Doan's Kidney Pills, I at once purchased a box, and from the first obtained relief, and after having taken five boxes am now completely cured."

Doan's Kidney Pills are 50 cents per box, or three boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering specify "Doan's."

GARDEN SEEDERS



Our **seeder** has years of success behind it and with improvements recently added, makes it without a doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. **The flow of seed** can be instantly stopped by a **swinging cut-off** operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. **The covering wheel** is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. **The main wheel** is high with a wide rim which keeps it from sinking into the soft earth.

Each year finds the demand for our garden seeders greatly increased. No better **seeder** can be built for accurate and fast sowing of **turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn** and all other kinds of **garden seed.**

Every machine carries our **absolute guarantee.**

WHEREAS, the Provincial Department of Agriculture have shown their interest in the Farmers and Dairymen's Association, by providing judges, speakers and stock for the short course held by the said Association,

THEREFORE RESOLVED, that the sincere thanks of this Association be tendered Hon. Dr. Landry, Commissioner of Agriculture, for the valuable assistance rendered by the Department of Agriculture.

* * * *

DRAINAGE AND ITS EFFECTS

Following the passing of resolutions, Dr. C. J. Lynde, of McDonald College, delivered an instructive address on Drainage and Its Effects, which was well received and which will be published in full in our next issue.

Dr. Lynde is quite conversant with New Brunswick conditions as he spent three weeks in the province last summer on the Farming Special Train and in that capacity he met and conversed with farmers from nearly all sections of the province. Dr. Lynde may rest assured that he will always receive a hearty welcome from New Brunswick farmers wherever he chances to meet them.

PRACTICAL AGRICULTURAL EDUCATION FOR NEW BRUNSWICK.

Mr. Elliott made a practical address on the agricultural education that was most needed by the farmers of New Brunswick. He said that the idea of the whole system of agricultural education had changed within the past ten years, and particularly within the last four years. Forty odd years ago the agricultural colleges began to be established throughout North America as the result of the recognized need for agricultural education. The agricultural college had been seriously misunderstood, it being expected that the students would return to the farms to work them, but rather the college was a school for the education of teachers, in order that they might go out and educate others. It was a notable fact that the students who did return to the land were leaders of educational and social thought.

Shortly after the agriculture colleges had been established, farmers' institutes were looked to for the practical education which was given to the farmer, who did not have the advantage of attending the colleges. That served to accomplish a good deal but lately it had ceased to be the value it was once. On that account there was introduced throughout Canada and the United States What were known as Farmers' Institute Schools as well as short courses in agriculture at the colleges. This was a great advantage, reaching as it did the younger element and assisting materially in having the boys reach a decision and adopt agriculture as an occupation.

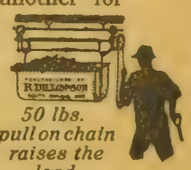
Within the last four years, however, there has been another great movement inaugurated, that of carrying the agricultural college to the farmer on his farm by means of what are usually called, agricultural experts or district representatives. This movement America over is seriously hampered, due to the fact that the right kind of men cannot be obtained for this work. In the State of Nebraska, where Mr. Elliott spent three months last autumn, there were places available for 100 men and sufficient money on hand to pay them, but not a score of competent men could be obtained for the positions. It might be asked what does this agricultural expert or representative do. There were peculiar qualifications necessary for this work. Not only must the representative be scientific, but he must be thoroughly practical and be able to go into the field and show how the work should be done. A sufficient area of country is allotted to his care. He might be called the agricultural doctor, to be called in and consulted in cases of emergency, and also to be on hand to give the direction to prevent emergencies arising. It is found that where those experts have operated the cultivation of the

(Continued on page 362)

Some farmers are like Gladstone. You will remember he got his exercise by chopping down trees.

Some farmers—a good many of them—are getting theirs like the man in the picture above.

Trundling one wheelbarrow-load after another for half a day from stable to yard is exercise all right. And what a "plug" it is to get a well-filled wheelbarrow up the plank gangway on to the manure heap—especially in winter.



50 lbs. pull on chain raises the load.

But have you time for this exercise?

Then why do it?

You wouldn't think of sowing or reaping in the old-fashioned way. Then don't make cleaning out stables the exception.

Load of 800 lbs. runs easily along the smooth track.

DILLON'S LITTER CARRIER lightens the labors of farmer's boy or hired man. It enables him to finish the stables in a fraction of the time before required.

A trim, well-kept barnyard, too, is the result of using a DILLON LITTER CARRIER. The bucket can be run out over the yard and dumped where desired.

A boy can work it. It can be fitted up without difficulty. The cost is the minimum for a first-class equipment. We have no Agents—you deal directly with the factory.

DILLON'S Litter Carrier

Figure it out for yourself.
Get our free book.

Dillon's sell direct to the Farmer. There are no Agents and no Agents' profits. The price is the same to all, and lower than you would expect for such substantial and well-built equipment. DILLON'S BOOK ON CLEAN STABLES gives you an exact idea of what you can accomplish for a small outlay. Write for a free copy. 3

THE HORSE.

The Brood Mare

Foaling time is at hand. The mares should be in prime condition as to flesh and health. Sleek coat, bright eye, good spirits indicate thrift. Can't expect much of a colt from a mare that has had to rough it in the stalk fields and straw piles all winter without extra feed. If she had access to a clover or alfalfa stack it will be different.

The foal is nearly a,l muscle, and muscle is made of protein. There's mighty little protein in a straw pile or stalk field. Then as the work season comes on and this run-down mare has to buckle down to hard work her system is drained just that much more of necessary protein that should go to the foal.

The mare is a mother. She deserves decent treatment. If you can't give it then use geldings and let another raise colts. In the first place the mare needs a clean, dry place to stay in nights. She should be out excerising during the day unless stormy. As foaling time approaches keep watch. The teats will wax about three days before foaling. Put her in a box stall where nothing can harm her or the colt. She may drop if standing. Good clean bedding is necessary. If born in filth navel-ill is apt to attack the colt. Take your lantern and go out every night and see that all is well.

The mare should receive a plentiful supply of ground oats, bran and a little oil meal in connection with a little bright hay. Carrots or any green feed will be useful in keeping her cool and open. You have got to build bone and muscle in the foal besides keeping the mare in condition and doing light work. You can't do that on corn stalks and straw.

When the foal comes get it around to the mare's head so she can lick it dry. Disinfect the umbilical cord with a strong solution of formalin, carbolic acid, bichloride or mercury or sheep dip and then tie it with a string about three inches below navel. Don't help the colt on its feet. When it gets strong enough it will get up and take nourishment. It can go two or three hours without food. See that its bowels move in a short time after birth.

If the mare does not clean in a reasonable time have a veterinarian remove the afterbirth.

Keep the pen clean. Feed the mare well and let her fully recover before putting her to work again.

Poisoning Horses By Moldy Food

In a comprehensive treatise in American Veterinary Review, on the late outbreak of the Kansas disease among horses, Dr. C. H. Stange, Dean of the Division of Veterinary Medicine of the Iowa State College has the following to say of the danger of feeding horses moldy food of any sort:

"A considsrable number of outbreaks of mold poisoning have been investigated by the writer in the past five years, and while there is a great similarity between the clinical symptoms of mold poisoning and the recent (Kansas) outbreak, there are nevertheless, some very important differences in reference to the appearance and spread of the disease. In all outbreaks of forage poisoning with which I have had experience and which literature records, we have practically all animals affected that partook of a certain moldy food or of water from one source. This food or water in my experience has always been visibly affected by some fungus. This is notably true of silage; and feeding experiments with horses have substantiated our theory as correct."

From this it would appear that farmers should be very careful how they feed silage to horses and colts. Any mold in the silage or moldy corn is particularly dangerous to the horse tribe. This is shown in the natural care the horse shows in pasture to feed only on such portions of the field where the grass is sweet and free of deleterious substances. The stomach of the horse is much more sensitive to such conditions than the cow, and still moldy silage should never be fed to any animal. The place for it is in the manure heap.

An Act for the Encouragement of Horse Breeding in Nova Scotia.

In reply to several inquiries re the Stallion Enrolment Act in Nova Scotia we publish the Act in full. It reads as follows:

1. In this Act the following words and expressions shall have the meanings in this section assigned to them respectively, unless there is something in the context repugnant to such construction:

"Secretary" means the Secretary for Agriculture for the Province.

"Department" means the Department of Agriculture.

"Owner" includes a part owner.

2. (1) No person, firm or company shall stand, travel or offer for use any stallion in this province unless and until the name, description and pedigree of such stallion shall have been enrolled and a certificate of such enrolment procured as hereinafter provided.

(2) The fee for such enrolment and certificate shall be two dollars.

(3) Upon a transfer of the ownership of any stallion enrolled under this section, the certificate of enrolment may be transferred to the transferee by the Secretary, upon proof to his satisfaction and upon payment of the fee of one dollar.

3. In order to procure the certificate of enrolment herein provided for, the owner of such stallion shall forward to the Secretary the certificate or registry and other necessary papers relating to the breeding and ownership of the said stallion. When it is impossible for the Secretary to personally confirm these papers and statements, the owner of such stallion shall make oath before a notary public or any officer duly authorized to administer oaths, that such paper and statements are, to the best of his knowledge, correct, and shall forward this affidavit, together with the registration and other necessary papers relating to his breeding and ownership, to the Secretary.

Horsemen Attention ! !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevents the diseases common to horses, such as Coughs, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

Before Using

CURES:

After Using

Use this preparation thoroughly for alland every disease of the horse for which it is recommended. Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on it's merits, you will be compelled to endorse it.

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly rccommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it. Very truly,
RODERICK McKENZIE.

DEAR SIR :--I have used Dr. J Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.
W. A. C. RANDALL, M. D.
Hillsboro, N. S.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable
(Signed) WALTER SLATER, "Cash Livery."

FRASIER THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market and am never without your Liniment and Condition Powders in my stable.

Say I Saw It in The FARMER

4. All certificates of enrolment shall be renewed annually upon payment of the fee of one dollar.

5. The owner of any stallion used for public service in this province, shall post and keep affixed during the entire breeding season, copies of the certificate of such stallion, issued under the provisions of this Act, in a conspicuous place, both within and upon the outside of every stable or building where the stallion is used for public service.

6. The certificate issued for a stallion whose sire and dam are of pure breeding and which is registered in a book approved by the Department, shall be in Form A in the schedule hereto.

7. The certificate issued for a stallion whose sire is of pure breeding, and which is registered in a book approved by the Department, but whose dam is not of pure breeding, shall be in Form B in the schedule hereto.

8. The certificate issued for a stallion whose sire and dam are pure bred, but not of the same breed, or whose sire and dam are neither of them pure breed, shall be in Form C in the schedule hereto.

9. Registration in a Canadian National Record for a breed will be considered evidence of the pure breeding of any stallion so registered. Where a stallion is pure bred of some breed for which there is no record under the Canadian National Records, before being enrolled in form A or B, proof of pure breeding satisfactory to the Secretary shall be supplied.

10. Each bill and poster issued by the owner of any stallion under this Act, or used by him as agent for advertising such stallion, shall contain a copy of the stallion's certificate of enrolment, printed in bold face type, not smaller than long primer, on said bill or poster, and the first mention thereon of the name of the stallion shall be preceded by the words "pure bred," "grade" or "cross bred," in accordance with the wording of the certificate of enrolment; and it shall be illegal to print upon the poster any misleading reference to the breeding of the stallion, his sire or his dam, or to use upon such bill or poster the portrait of a stallion in a misleading way; and each newspaper advertisement, printed to advertise any stallion for public service, shall show the enrolment certificate number and state whether it reads "pure "pure bred," "grade" or "cross bred."

11. The production of any bill, poster or other printed or written matter, advertising any stallion for public service shall be prima facie evidence that such bill, poster or other advertising material was used to advertise the stallion named and described therein by or with the consent of the owner or owners of the said stallion.

12. Where no posters are used to advertise a stallion, the owner of the stallion shall exhibit to the owner of each mare at the time of service, if demanded, the original enrolment certificate issued for such stallion.

13. The fees received by the Secretary under this Act shall be paid to the Provincial Treasury of Nova Scotia for the use of the Province.

14. The Lieutenant-Governor-in-Council may make such regulations as may be deemed proper and necessary for the better carrying out of the provisions of this Act.

15. Every person who is guilty of contravention of any of the provisions of this Act shall incur a penalty of not more than one hundred dollars or less than twenty-five dollars, recoverable under the Nova Scotia Summary Convictions Act.

16. This Act shall come into force on the first day of January, 1913.

SUSSEX, N. B.

STALLION INSURANCE

OUR Stallion Policies, covering against loss by **Death through Accident or Disease,** are more liberal and afford more protection to owners than any issued by Competing Company. They contain no vexatious clauses, having been drafted to cover **the special conditions** met with in this Country. They cover the horse no matter **where he might be** and not merely **in his own stable,** as certain Companies do. This is very important during the Breeding Season as the horse might die while being on the road. Do not **take any chances** by insuring with others, **insure with us;** The insurance premium represents only a small proportion of the service fees earned. Better risk the **loss of the premium** than the **purchase price** of your beast if it dies without insurance.

Better have and not need than need and not have.

All kinds of live stock insurance transacted. *Write for particulars and address of nearest agent.*

POULTRY.

Pointers on Marketing Eggs.

Even though the egg crop is large, if that crop is not properly marketed there will be only ordinary profit. It is admitted that a good retail trade is the best market, but the farm is not always so situated that this can be obtained.

It is important, then, that a good wholesale custom be secured, and this makes it necessary that the goods be in such a condition that they will be sought after.

An ingenious method to advertise the eggs is to have a rubber stamp made with the wording of the farm on it, something like this:

GUARANTEED FRESH,
PUREBRED POULTRY FARM,
SUSSEX, N. B.

This stamped on each egg would at once attract attention, and if those eggs are found to be true to representation, there would be no trouble to hold that customer.

The question arises: "When does an egg cease to be fresh?"

Investigation has proved that an egg remains in a fresh state for three days. Some farms ship eggs when a day old, to allow two days' time for carriage and for the sale. This is a safe plan. As a rule, however, guaranteed fresh eggs are purchased the day they are placed on sale. Such eggs are for the "fancy, up-town grocery trade" of cities.

What is known as "Prime" eggs in the city trade are eggs of which the age is not unknown—they being from one to three weeks of age in cool weather.

"Fresh case" eggs are a class out of which it may be expected to secure six good ones, three fair ones, and three of a "demoralized" order, in each dozen.

It seems that the market is always ready for good, bad and indifferent eggs. Of course, it goes without saying, that the stamped eggs are sold first, and at an advanced figure, as there is a special demand for them.

In nearly all the large cities there are grocers who cater to a fancy trade, and these are only too glad to arrange with some farm having a reputation for furnishing eggs that are strictly fresh.

Eggs should be gathered at least once a day, and even twice or three times daily is better. They should be placed in a cool, clean cellar, away from any impure odors, for an egg will quickly absorb any impurity that might be near it.

Eggs should not be marketed that are not regularly found in the nest, eggs from hidden nests, or picked up in the run, are risks, and should be used at home. Great care must be taken in this particular. All stains and dirt should be wiped with a moist cloth and then allowed to dry. A little vinegar will often remove the most obstinate stain.

Those who become discouraged by mistakes are not very progressive. Instead of being stumbling blocks, mistakes are object lessons that arouse one to a sense of closer observation and point out facts. However, the man who makes the same mistake twice is not a very observing person.

The older the egg the less is that sweet, rich flavor noticeable.

It is more important to know the work of the individual hen than the average of the flock.

There is no foundation for the assertion that the "sweet, rich flavor" of the egg belongs to the breed. That condition can only be brought about by the quality of the food.

There is a decided difference in the weight of eggs from pullets and hens, and of those laid by different breeds. These figures are approximately correct: Single comb Brown Leghorn pullets, 17½ ounces per dozen; hens, 21½ ounces. Light Brahma pullets, 23½ ounces; hens, 23 ounces. Black Langshan pullets, 24 ounces; hens, 26½ ounces. Pekin ducks 35½ ounces.

The question of feeding flavor into eggs, was practically settled some years ago by Professor F. E. Emery, of the North Carolina Experiment Station, who tried feeding onions to hens, with the result that the eggs of all those which ate the onions showed a more or less distinct flavor. Therefore it appears that to get fine flavored eggs it is necessary to restrict runs enough so that no considerable amount of the food can be of such a character as to yield ill-flavored eggs.

The large breeds are best for caponizing. A few months old capon is no better than a cockerel. A capon will more readily put on fat and get large and prime after maturity. The object in caponizing is to secure quality and size, but quality is the most important. Age does not impair a capon as it does a cockerel, provided the bird is not kept longer than a year and a half. Capons will have to mature before they can get much finish, and for that reason they cannot be sold while young.

No poultry meat excels, if any equals, a half-grown Guinea, split down the back, broiled and buttered. It is meaty, tender and of splendid flavor.

Feeding skim milk has a tendency to whiten the flesh.

Remember "good condition" does not mean overfat.

It must not be forgotten that food flavors the flesh as well as the egg.

Our American breeds fatten very readily, making them ideal market poultry.

The yolk of an egg spoils much quicker than the white.

The first one or two litters of eggs laid by pullets are not so serviceable, so sure or profitable for hatching as is their later product, for the reason that they were first formed at a time when the pullet was growing and the organs not fully developed.

An authority says that if the egg is placed on the side or large end the heavy yolk will settle to the bottom and come in contact with the shell which admits the air. If it is placed on the small end, it will always have a layer of white between it and the shell.

Colonel Roessle once said there ma not be any very large fortune to be made in poultry raising, but there is a handsome living for any one who has the love for the pursuit, the ability to raise and care for the stock, and a small capital to start with. These three things must go hand in hand; separately they cannot bring success.

Bad cases of feather eating have been cured by painting around the bare places on hens that have had their feathers plucked, with a preparation made of powered aloes dissolved in alcohol. Hens do not like the bitter taste.

A French naturalist asserts that the use of pounded garlic with the usual food has been made to completely eradicate the gapes among pheasants in Europe.

The beginner finds many stumbling blocks in the artificial methods, but experience soon shows the trick of how to easily step over them.

Over-feeding of green cut bone is apt to cause leg troubles, diarrhoea, bowel complaints and worms.

A poultry keeper living some distance from the city says he found it difficult to secure animal food for his fowls, so he experimented with beans, peas, nuts, sunflower seed and peanuts with as good results as obtained from animal food.

It is claimed by one authority that

Don't Buy Fence, Posts or Gates Until

you have seen our catalogue, It is the most useful fence catalogue ever sent to farmers. It tells how to build fence, how to measure up what you require, and how to save money when ordering.

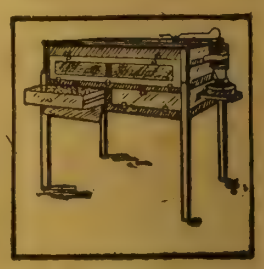
THE TIE THAT BINDS

STANDARD FENCE

$5,000,000.00
FOR PEERLESS WAY POULTRYMEN



Into the pockets of the users of The Peerless Way last year went five million dollars made from the poultry these people raised. Yet chickens are scarce in Canada and eggs are the scarcest of all food commodities. That is positively the fact.

To-day there are not enough Canadian CHICKENS or EGGS to go around. Thousands of chickens and hundreds of thousands of dozens of eggs are being shipped into Canada from the United States and other countries to help meet the demand.

Yet there is a shortage! Eggs are commanding a tremendous price—chickens are worth dollars.

Now is the time to take advantage of this situation and make money out of it yourself. You can raise and sell 600 chickens this next year, and you will find a quick and sure market for every one of them. You can get the top notch price for all the hundreds of dozens of eggs that your poultry lay.

Let us tell you how!

Poultry raising is the best business for any farmer, any farmer's wife or farmer's child. The poultry crop is the one crop that never fails. It pays better for the time and money invested; the profit is surest; it isn't overcrowded and never will be.

Our book "When Poultry Pays," will show you. Let us send it to you. It is interesting; it is instructive, and it contains the proof.

You need this book. It will be mailed free. A post card will bring it.

NEVER NEGLECT A HEADACHE.

Headache is not a disease in itself, but is often a source of great suffering, and its presence is likely symptomatic of some disease lurking in the system.

To get rid of the headache, and thus prevent more serious troubles, it is absolutely necessary to cleanse the system of all waste and poisonous matter, and keep the bowels well open, the clogging of the bowels being one of the principle causes of headache. Burdock Blood Bitters regulates the bowels, and makes their movement free and natural. A cure for headache; a medicine that cures where others fail.

Mrs. L. Banks, Mt. Hanley, N.S., writes:—"Several years ago I was a constant sufferer from headache. I was all run down, and nothing seemed to do me any good. I read of Burdock Blood Bitters, and decided to give it a trial. The result was marvellous, the headache stopped entirely, and I feel better in every way. I can safely recommend B.B.B."

one hundred pounds of clover meal contains enough lime for the shells of 17½ dozens of eggs. Clover is very rich in protein and contains potash, soda, phosphoric acid, and other ingredients that make it one of the best feeds for fowls that can be named. It contains all the essentials in well balanced proportion, and is palatable to the fowls as well as healthful.

Some years ago Professor James Dryden delivered an address before the Utah Farmers' Institute, from which this extract is worthy of reproduction: A short study of the composition of wheat and of eggs will explain why a profitable egg yield cannot be expected from wheat alone. Supposing you fed a hen which weighs 3.5 pounds, 3.25 ounces of wheat a day. Of course a hen of that weight would not long consume that weight of wheat alone. Supposing, further, that the hen uses 2.75 ounces of that for the maintainance of the body; that leaves half an ounce to be conveyed into eggs, assuming that all the food is digested, which of course is not the case. In half an ounce of wheat there is about .06 of an ounce of protein. So that, assuming that the hen consumes and digests 3.25 ounces of wheat per day, and that she uses 2.75 ounces of that for maintainance of the body, there is available each day just one-fourth enough protein for an egg. In other words it will take four days to get the necessary amount of protein for one egg. But the egg has other constituents; so has wheat. The half ounce of wheat contains about one and one-half times as much carbohydrates and fat as one egg contains. The hen fed on wheat alone has a surplus of one material and a deficiency of another. In other words, she has enough carbohydrates and fat to make an egg and a half a day, but she has only protein enough to make one egg in six days. You place the hen in an awkward position by feeding her wheat alone. Wheat does not contain the egg making materials in proper portion. Corn is even worse than wheat in this respect.

What Bumble Foot is.

Bumble foot is really little more than a festered corn or a callus on the bottom of the foot. It is a well known fact that people who are not on their feet very much have little or no foot trouble and that people who are standing or working on their feet constantly have more or less foot trouble. That is just the way it is with hens. The busiest hen is most likely the one to be troubled with bumble foot.

Bumble foot is more prevalent in houses where the roost and nests are placed more than two feet above the floor and since it is necessary for convenience to have the roosts and nests higher than this it naturally follows that many of the hens will have corns.

Even in the most severe cases bumble foot is not a serious trouble and there are only rare instances where it is necessary to give it much attention, aside of course, from keeping the floor covered with straw. When it is necessary to apply treatment only two things need be kept in mind. First to lance so that the pus can be allowed to escape, and second to disinfect the wound and protect it from outside infection and from being picked by the other hens. When it is thought necessary to lance, thoroughly cleanse the foot before and dip in 5 per cent. alum water, then apply axle grease liberally and sew up in a clean cloth. When the cloth wears off, the foot will be well.

Natural Finish California Redwood (12c)

125-Egg Incubator and Brooder Both For $13.75

If ordered together we send both machines for only $13.75 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. David Copperfield.

By Charles Dickens.

(Continued from last issue)

I should think there never can have been a man who enjoyed his profession more than Mr. Creakle did. He had a delight in cutting at the boys, which was like the satisfaction of a craving appetite. I am confident that he couldn't resist a chubby boy, especially; that there was facination in such a subject, which made him restless in his mind, until he had scored and marked him for the day. I was chubby myself, and ought to know. I am sure when I think of the fellow now, my blood rises against him with the disinterested indignation I should feel if I could have known all about him without ever having been in his power; but it rises hotly, because I know him to have been an incapable brute, who had no more right to be possessed of the great trust he held, than to be Lord High Admiral, or Commander-in-chief—in either of which capacities, it is probable, that he would have done infinitely less mischief.

Miserable little propitiators of a remorseless Idol, how abject we were to him! What a launch in life I think it now, on looking back, to be so mean and servile to a man of such parts, and pretensions.

Here I sit at the desk again, watching his eye—humbly watching his eye, as he rules a ciphering book for another victim whose hands have just been flattened by that identical ruler, and who is trying to wipe the sting out with a pocket-handkercheif. I have plenty to do. I don't watch his eye in idleness, but because I am morbidly attracted to it, in a dread desire to know what he will do next, and whether it will be my turn to suffer, or somebody's else's A lane of small boys beyond me, with the same interest in his eye, watch it too. I think he knows it, though he pretends he don't. He makes dreadful mouths as he rules the ciphering book; and now he throws his eye sideways down our lane, and we all droop over our books and tremble. A moment afterwards we are again eyeing him. An unhappy culprit, found guilty of imperfect exercise, approaches at his command. The culprit falters excuses, and professes a determination to do better to-morrow.

Mr. Creakle cuts a joke before he beats him, and we laugh at it—miserable little dogs, we laugh, with our visages as white as ashes, and our hearts sinking into our boots.

Here I sit at the desk again, on a drowsy summer afternoon. A buzz and hum go up around me, as if the boys were so many blue-bottles. A cloggy sensation of the lukewarm fat is upon me (we dined an hour or two ago), and my head is as heavy as so much lead. I would give the world to go asleep. I sit with my eye on Mr. Creakle, blinking at him like a young owl; when sleep overpowers me for a minute, he still looms through my slumber, ruling those ciphering books, until he softly comes behind me and wakes me to plainer perception of him, with a red ridge across my back.

Here I am in the playground, with my eye still fascinated by him, though I can't see him. The window at a little distance from which I know he is having his dinner, stands for him, and I eye that instead. If he shows his face near it, mine assumes an imploring and submissive expression. If he looks out through the glass, the boldest boy (Steerforth excepted) stops in the middle of a shout or yell, and becomes comtemplative. One day, Traddles (the most unfortunate boy in the world) breaks that window accidentally with a ball. I shudder at this moment with the tremendous sensation of seeing it done, and feeling that the ball has bounded on to Mr. Creakle's sacred head.

Poor Traddles! In a tight sky-blue suit that made his arms and legs like German sausages, or roly-poly puddings, he was the merriest and most miserable of all the boys. He was always being caned—I think he was caned every day that half-year, except one holiday Monday when he was only ruler'd on both hands—and was always going to write to his uncle about it, and never did. After laying his head on the desk for a little while, he would cheer up somehow, begin to laugh again, and draw skeletons all over his slate, before his eyes were dry. I used at first to wonder what comfort Traddles found in drawing skeletons; and for some time looked upon him as a sort of hermit, who reminded himself by those symbols of mortality that caning couldn't last for ever. But I believe he only did it because they were easy, and didn't want any features.

He was very honourable, Traddles was, and held it as a solemn duty in the boys to stand by one another. He suffered for this on several occasions; and particularly once, when Steerforth laughed in church, and the Beadle thought it was Traddles, and took him out. I see him now, going away in custody, despised by the congregation. He never said who was the real offender, though he smarted for it next day, and was imprisoned so many hours that he came forth with a whole churchyard of skeletons swarming all over his Latin Dictionary. But he had his reward. Steerforth said there was nothing of the sneak in Traddles, and we all felt that to be the highest praise. For my part, I could have gone through a good deal (though I was much less brave than Traddles, and nothing like so old) to have won such a recompense.

To see Steerforth walk to church before us, arm-in-arm with Miss Creakle, was one of the great sights of my life. I didn't think Miss Creakle equal to little Em'ly in point of beauty, and I didn't love her, (I didn't dare); but I thought her a young lady of extraordinary attractions, and in point of gentility not to be surpassed. When Steerforth, in white trousers, carried her parasol for her, I felt proud to know him; and believe that she could not choose but adore him with all her heart. Mr. Sharp and Mr. Mell were both notable personages in my eyes; but Steerforth was to them what the sun was to two stars.

Steerforth continued his protection of me, and proved a very useful friend, since nobody dared to annoy one whom he honored with his countenance. He couldn't —or at all events he didn't—defend me from Mr. Creakle, who was very severe with me; but whenever I had been treated worse than usual, he always told me that I wanted a little of his pluck, and that he wouldn't have stood it himself; which I felt he intended for encouragement, and considered to be very kind of him. There was one advantage, and only one that I know of, in Mr. Creakle's severity. He found my placard in his way when he came down behind the form on which I sat, and wanted to make a cut at me in passing; for this reason it was soon taken off, and I saw it no more.

An accidental circumstance cemented the intimacy between Steerforth and me, in a manner that inspired me with great pride and satisfaction, though it sometimes led to inconvenience. It happened on one occasion, when he was doing me the honor of talking to me in the playground, that I hazarded the observation that something or somebody— I forget what now—was like something or somebody in Peregrine Pickle. He said nothing at the time; but when I was going to bed at night, asked me if I had got that book?

I told him no, and explained how it was that I had read it, and all those other books of which I have made mention.

"And do you recollect them?" Steerforth said.

Oh yes, I replied: I have a good memory, and I believed I recollected them very well.

"Then I tell you what, young Copperfield," said Steerforth, "you shall tell 'em to me. I can't get to sleep very early at night, and I generally wake rather early in the morning. We'll go over 'em one after another. We'll make some regular Arabian Nights of it."

I felt extremely flattered by this arrangement, and we commenced carrying it into execution that very evening. What ravages I committed on my favorite authors in the course of my interpretation of them. I am not in a condition to say, and should be very unwilling to know; but I had a profound faith in them, and I had, to the best of my belief, a simple earnest manner of narrating what I did narrate; and these qualities went a long way.

The drawback was, that I was often sleepy at night, or out of spirits and indisposed to resume the story, and then it was rather hard work, and it must be done; for to disappoint or to displease Steerforth was of course out of the question. In the morning too, when I felt weary, and should have enjoyed another hour's repose very much, it was a tiresome thing to be roused, like the Sultana Scheherazade, and forced into a long story before the getting-up bell rang; but Steerforth was resolute; and as he explained to me, in return, my sums and exercises, and anthing in my tasks that was too hard for me, I was no loser by the transaction. Let me do myself justice, however. I was moved by no interest or selfish motive, nor was I moved by fear of him. I admired and loved him, and his approval was reward enough. It was so precious to me, that I look back on these trifles, now, with an aching heart.

Steerforth was considerate too, and showed his consideration in one particular instance, in an unflinching manner, that was a little tantalising, I suspect, to poor Traddles and the rest. Peggotty's promised letter — what a comfortable letter it was!— arrived before "the half" was many weeks old, and with it a cake in a perfect nest of oranges, and two bottles of cowslip wine. This treasure, as in duty bound, I laid at the feet of Steerforth, and begged him to dispense.

"Now, I tell you what, young Copperfield," said he: "the wine shall be kept to wet your whistle when you are story-telling."

I blushed at the idea, and begged him, in my modesty, not to think of it. But he said he had observed I was sometimes hoarse—a little roopy was his exact expression— and it should be, every drop, devoted to the purpose he had mentioned. Accordingly, it was locked up in his box, and drawn off by himself in a phial, and administered to me through a piece of quill in the cork, when I was supposed to be in want of a restorative. Sometimes, to make it a more sovereign specific, he was so kind as to squeeze orange juice into it, or to stir it up with ginger, or dissolve a peppermint drop in it; and although I cannot assert that the flavor was improved by these experiments, or that it was exactly the compound one would have chosen for a stomachic, the last thing at night and the first thing in the morning, I drank it gratefully, and was very sensible of his attention.

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

MOTHER OF LARGE FAMILY

Tells How She Keeps Her Health — Happiness For Those Who Take Her Advice.

Scottville, Mich.—"I want to tell you how much good Lydia E. Pinkham's Vegetable Compound and Sanative Wash have done me. I live on a farm and have worked very hard. I am forty-five years old, and am the mother of thirteen children. Many people think it strange that I am not broken down with hard work and the care of my family, but I tell them of my good friend, Lydia E. Pinkham's Vegetable Compound, and that there will be no backache and bearing down pains for them if they will take it as I have. I am scarcely ever without it in the house.

"I will say also that I think there is no better medicine to be found for young girls. My eldest daughter has taken Lydia E. Pinkham's Vegetable Compound for painful periods and irregularity, and it has helped her.

"I am always ready and willing to speak a good word for Lydia E. Pinkham's Vegetable Compound. I tell every one I meet that I owe my health and happiness to your wonderful medicine." —Mrs. J. G. JOHNSON, Scottville, Mich., R F D. 3.

Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs, contains no narcotics or harmful drugs, and today holds the record of being the most successful remedy for woman's ills known.

THE BUTTER-BUYER said—"Your two lots of butter taste all right—but will they keep? What kind of salt did you use?"

THE FIRST FARMER said—"I don't know—the storekeeper gave me what he had".

THE SECOND FARMER said—"I used Windsor Dairy Salt".

THE BUTTER-BUYER said—"I want your butter. I know all about Windsor Dairy Salt—and the man who is particular enough to always use Windsor Dairy Salt is pretty sure to be particular to make good butter.

I'll take all you make—as long as you use

WINDSOR DAIRY SALT

THE St. JOHN Business COLLEGE

S. KERR Principal.

The Nova Scotia "Lumber King" says:

"I consider MINARD'S LINIMENT the BEST liniment in use.

I got my foot badly jammed lately. I bathed it well with MINARD'S LINIWENT and it was as well as ever next day.

Yours very truly,
T. G. McMULLEN.

PUPIL NURSES

A 56 bed new Hospital with modern equipment, and new Nurses' Home can accommodate a few pupil nurses. Course two years and three months. Allowance towards uniforms, books, etc. Prospectus sent on application.

FRANKLIN CO. HOSPITAL,
Greenfield, Mass.

We seem, to me, to have been months over Peregrine, and months more over the other stories. The institution never flagged for want of a story, I am certain, and the wine lasted out almost as well as the matter. Poor Traddles—I never think of that boy but with a strange disposition to laugh, and with tears in my eyes—was a sort of chorus, in general and affected to be convulsed with mirth at the comic parts, and to be overcome with fear when there was any passage of an alarming character in the narrative. This rather put me kut, vesy often. It was a great jest of his, I recollect, to pretend that he couldn't keep his teeth from chattering, whenever mention was made of an Alguazil in connection with the adventutes of Gil Blas; and I remember that when Gil Blas met the captain of the robbers in Madrid, this unlucky joker counterfeited such an ague of terror, that he was overheard by Mr. Creakle, who was prowling about the passage and handsomely flogged for disorderly conduct in the bedroom.

Whatever I had in me that was romantic and dreamy, was encouraged by so much story-telling in the dark; and in that respect the pursuit may not have been very profitable to me. But the being cherished as a kind of plaything in my room, and the consciousness that this accomplishment of mine was bruited about among the boys, and attracted a good deal of notice to me though I was the youngest there, stimulated me to exertion. In a school carried on by sheer cruelty, whether it is presided over by a dunce or not there is not likely to be much learnt. I believe our boys were, generally, as ignorant a set as any schoolboys in existence; they were too much troubled and knocked about to learn; they could no more do that to advantage, than any one can do anything to advantage in a life of constant misfortune, torment and worry. But my litttle vanity, and Steerforth's help, urged me on somehow; and without saving me from much, if anything, in the way of punishment, made me, for the time I was there, an exception to the general body, insomuch that I did steadily pick up some crumbs of knowledge.

In this I was much assisted by Mr. Mell, who had a liking for me that I am grateful to remember. It always gave me pain to observe that Steerforth treated him with systematic disparagment, and seldom lost an occasion of wounding his feelings, or inducing others to do so. This troubled me the more for a long time, because I had soon told Steerforth, from whom I could no more keep such a secret than I could keep a cake or any other tangible possession, about the two old women Mr. Mell had taken me to see; and I was always afraid that Steerforth would let it out, and twit him with it.

We little thought, any of us, I dare say, when I ate my breakfast that first morning, and went to sleep under the shadows of the peacock's feathers to the sound of the flute, what consequences would come of the introduction into these almshouses of my insignificant person. But the visit had its unforseen consequences; and of a serious sort, too, in their way.

One day when Mr. Creakle kept the house from indisposition, which naturally diffused a lively joy through the school, there was a great deal of noise in the course of the morning's work. The great relief and satisfaction experienced by the boys made them difficult to manage; and though the dreaded Tungay brought his wooden leg in twice or thrice, and took notes of the principal offenders' names, no great impression was made by it, as they were pretty sure of getting into trouble tomorrow, do what they would, and thought it wise, no doubt, to enjoy themselves

BABY'S OWN SOAP

Best for Baby *Best for You*

THE particles of pure vegetable oil which are rubbed into the open pores of the skin with the creamy fragrant lather of Baby's Own Soap renew the life of the skin—help nature along. BISSELL LAND ROLLERS

are all steel except the Pole. They are braced and stayed to stand all kinds of hard work and wear well. The entire frame, bottom and all, is built of steel. The (18) anti-friction Roller Bearings make light draught.

The Draw Bracket and low hitch do away with neck weight.

The Axle revolves with the drums and there is no squeaking or grinding.

The Cages holding the anti-friction rollers are the best yet; they're MADE OF MALLEABLE ALL IN ONE PIECE—no twisting or binding of the bearings on the axle of the "Bissell" Roller. The Seat Spring is reinforced and is DOUBLED AT THE HEEL. These good features are not all of the advantages of the "Bissell" Roller. Many more good points are built into them, making a Land Roller that is "built for business," that stands up against lots of hard work.

Ask Dept M for free catalogue. 75

today.

It was, properly, a half-holiday; being Saturday. But as the noise in the play-ground would have disturbed Mr. Creakle, and the weather was not favorable for going out walking, we were ordered into school in the afternoon, and set some lighter tasks than usual, which were made for the occasion. It was the day of the week on which Mr. Sharp went out to get his wig curled; so Mr. Mell, who always did the drudgery, whatever it was, kept school by himself.

If I could associate the idea of a bull or a bear with any one so mild as Mr. Mell, I should think of him, in connection with that afternoon when the uproar was at its height, as one of those animals, baited by a thousand dogs. I recall him bending his aching head, supported by his bony hand, over the book on his desk, and wretchedly endeavoring to get on with his tiresome work, amidst an uproar that might have made the speaker of the House of Commons giddy. Boys started in and out of their places, playing at puss-in-the-corner with other boys; there were laughing boys, singing boys, talking boys, dancing boys, howling boys; boys shuffled with their feet, boys whirled about him, grinning, making faces, mimicking him behind his back and before his eyes; mimicking his poverty, his qoots, his coat, his mother, everything belonging to him that they should have had consideration for.

"Silence!" cried Mr. Mell, suddenlv rising up, and striking his desk with the book. "What does this mean? Its impossible to bear it. Its maddening. How can you do it to me, boys?"

It was my book that he struck the desk with; and as I stood beside him, following his eye as it glanced round the room, I saw the boys all stop, some suddenly surprised, some half afraid and some sorry perhaps.

Steerforth's place was at the bottom of the school, at the opposite end of the long room. He was lounging with his back against the wall, and his hands in his pockets, and looked at Mr. Mell with his mouth shut up as if he were whistling when Mr. Mell looked at him.

"Silence, Mr. Steerforth!" said Mr. Mell.

"Silence yourself," said Steerforth, turning red. "Whom are you talking to!"

"Sit down," said Mr. Mell.

"Sit down yourself," said Steerforth, "and mind your own business."

There was a titter, and some applause; but Mr. Mell was so white, that silence immediately succeeded: and one boy who had darted out behind him to imitate his mother again changed his mind, and pretended to want a pen mended.

"If you think, Steerforth," said Mr. Mell, "that I am not acquainted with the power you can establish over any mind here—" he laid his hand, without considering what he did (as I supposed), upon my head—"or that I have not observed you within a few minutes, urging your juniors on to every sort of outrage against me, you are mistaken."

"I don't give myself the trouble of thinking at all about you," said Steerforth, coolly; "so Iam not mistaken, as it happens."

"And when you make use of your position of favoritism, sir," pursued Mr. Mell, with his lip trembling very much, "to insult a gentleman—"

"A what?—where is he?" said Steerforth.

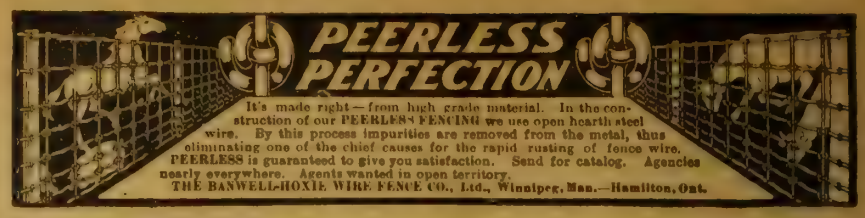
The Medicinal Uses of Turpentine.

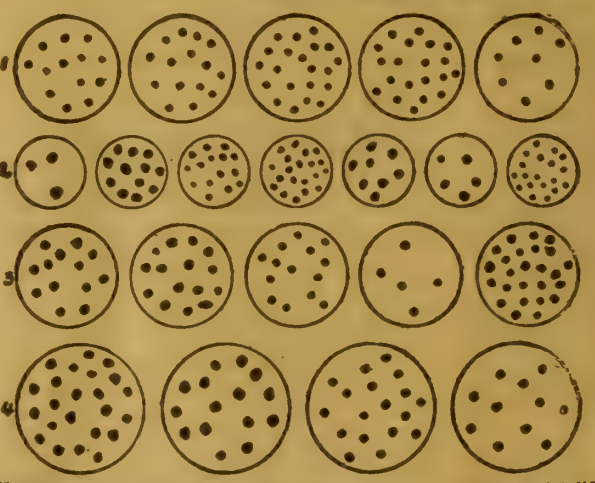
Turpentine, in which is dissolved as much camphor as it will take up, is pre- eminently the dressing for lacer-



FREE $300.00 IN PRIZES

IN THE GREAT DOT PUZZLE CONTEST
A Genuine Contest for WISE HEADS!

SOLVE THIS PUZZLE



The above 4 lines of circles containing dots represent the name of 4 different things described after each line. What are they?

HOW TO SOLVE THIS GREAT PUZZLE

Each circle of dots represents 1 letter of the word and the number of dots in each circle determine the letter in its relation to the alphabet. For instance: A is represented by 1 dot because it is the first letter in the alphabet, B is represented by 2 dots because it is the 2nd letter in the alphabet, C is represented by 3 dots because it is the 3rd letter in the alphabet. Now, with these simple instructions and a little patience you can soon have the puzzle solved. To give you a little assistance the 1st letter of the first word is M, because the circle contains 13 dots and M is the 13th letter of the alphabet.

After you have found the solution write your answer neatly on a piece of paper with your name and address and anything else you wish to say about the contest and send it in to us.

Those who send in the Correct or the Nearest Correct Answers; whose answers are the neatest and who live up to the condition of the contest (read rules of contest below), will win the following grand prizes:—

1st Prize, $125.00 in cash.
2nd " 50.00 "
3rd " 25.00 "
4th " 15.00 "
5th " Gent's Watch. Value $10.00.
6th " Ladies' Ring. Value $10.00.
7th " Fine Clock. Value $10.00.
8th " 44-Piece Dinner Set. Value $10.00.
9th Prize, Mission Upholstered Rocker Value $10.00.
10th Prize, Violin. Value $10.00.
11th Prize, Gillette Safety Razor. Value $5.00.
12th Prize, Waterman Fountain Pen Value $5.00.
13th Prize, Glass Water Set. Value $5.00.
14th Prize, Large French Doll. Value $5.00.
15th Prize, Silverware Set. Value $5.00.

READ THE SIMPLE RULES OF THIS CONTEST

1. Contestants may send in as many answers as they wish, but only one answer can win a prize. (2) Only 1 person in each family will be allowed to compete. (3) No employees of ours or any relation of any employee will be allowed to compete. (4) Children under 12 years of age will not be permitted to compete. (5) Write only on one side of the paper. (6) All letters must be fully prepaid in postage. We will not accept answers upon which we will have to pay postage. (7) The decision of the judges must be accepted as final. The judging will be in the hands of 3 gentlemen of integrity who are absolutely disinterested. (8) This contest is absolutely free. You are not asked to spend one cent of your money or buy anything to enter. As soon as we receive your answer we will immediately tell you if you are right, and how the prizes will be distributed. We guarantee the awarding of the prizes described above according to decision of the judges.

Address all answers to **Contest Department. 220**

NEW LIFE REMEDY COMPANY, TORONTO, ONT.

NEW CENTURY LEADERSHIP

A railroad navvy may be an honest soul and a worthy citizen, but that does not equip him for the position of general manager of the system.
It is the same with washing machines. Others may be honestly constructed, but the New Century maintains its paramount position by honesty PLUS.
The "plus" means patented and exclusive features found only in the New Century. It represents experience and brains applied to washing machine problems, and assures convenience and economy to New Century owners.

Your dealer can tell you the reasons for New Century leadership or we will send full information direct.

Minard's Liniment Co., Limited

PILES CURED at HOME by NEW Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money, but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309 Windsor, Ont.

FITS CURED

Send for Free Book giving full particulars of Trench's Remedy, the world-famous cure for Epilepsy and Fits Simple home treatment. 25 years success. Testimonials from all parts of the world; 1,000 in one year.

Trench's Remedies, LTD., 434 St James' Chambers TORONTO

There is no better medicine made for colds than Chamberlain's Cough Remedy. It acts on nature's plan, relieves the lungs, opens the secretions, aids expectoration; and restores the system to a healthy condition. For sale by all dealers.

ations, bruises, and cuts. Its antiseptic action is equal to that of carbolic acid; it speedily stops the bleeding (Hunter says, "It is the best, if not the only true styptic") allays the pain, and hastens the process of healing. Few, if any, ulcers long resist its continued application.

As a liniment, turpentine, with equal parts of laudanum, camphor, and chloroform, is unsurpassed. Sprains, rheumatic pains, bruises, and sometimes neuralgia yield to its magic influence.

As an inhalation, turpentine has proved of great service in bronchitis, pneumonia, pleurisy, and other throat and lung affections. If you have a cough, sprinkle a little on a handerchief and hold it to your mouth and nose for a few minutes, breathing the vapour, and note the relief.

Internally, turpentine has enjoyed for a century the reputation of being a specific for sciatica. Its mode of operation is unknown, but that it cures stands as a proof of its virtue. Ten drops three times a day in sweetened water is the dose.

As a remedy for that bane of childhood, worms, it is well known. A teaspoonful given in a half a glassful of milk, followed in an hour or so by a full glassful of castor oil, seldom fails. The practice of our grandmothers of giving it to us on sugar for coughs and sore throats was based on common sence.

A bath in half a pint of turpentine and two ounces of sal-soda in an ordinary bathtub, three quarters full of water, at 100 degs. Fahr., will cure pediculosis when other remedies fail. Three or four baths, one daily, are usually sufficient. Cottonwool soaked in olive oil and turpentine and put in the ear often stops ear ache of the most painful kind. In the hands of the physician turpentine is of great value in typhoid fever. Keep turpentine in the house.

The Art of Walking.

It is astonishing how few women have mastered the art of walking, which, after all, is one of tae best exercises in the world, and the foundation of all others. True all who are not absolutely cripples can "proceed by means of the feet," but that is not walking. The body should be held erect, shoulders down, chest extended, and the leg moving from the hip; the whole figure immovabfe above this point. The movement from the knee is the secret of nearly all bad walking, combined by the uncertain tread induced by tight boots with high heels, which render gait uneven, and twist the figure in a most ungrateful manner. A good brisk walk should be taken every morning, wet or fine. Walking, like all other exercises, should never be carried to extremes; a brisk spin will be more beneficial than a tramp of many miles, resulting in utter weariness.

Preserving Home-Produced Meat for Future Consumption.

Home production of meat is one of the greatest household economies that can be praticed on the farm, the great drawback which has always confronted the farmer being that the season when meat in the quantity can be kept successfully is generally the season when it is least needed by the majority of farm families.

In the greater number of cases the farmer pursues one of two courses—either he sells his surplus fresh meat in the fall and then pays more than double the price the following summer, or he subsists during the summer months on a diet of bacon and salt pork, which is as monotonous as it is unhealthful. So-called "meat clubs" have been successfully operat-

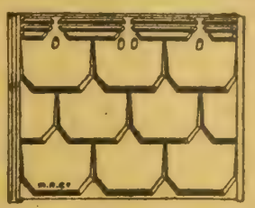
Eastlake Metallic Shingles

The Originators of Steel Shingles in Canada.

The Metallic Roofing Co., of Toronto and Winnipeg, are the originators of the steel shingle business in Canada, and were manufacturing years before any other manufacturers commenced making them.

We did not start manufacturing until we had spent thousands of dollars in experimenting, and produced what we thought to be, and has proved to be, a *perfect* shingle.

This shingle was named 'EASTLAKE,' and was put on the market over a quarter of a century ago.



"EASTLAKE" Metallic Shingles were laid on roofs over a quarter of a century ago, and are on those same roofs to-day as good as new, with practically no cost for repairs.

The "EASTLAKE" SHINGLE of then, is the "EASTLAKE" SHINGLE of to-day, and will serve *you* as well as it has served these customers for over twenty-five years.

We can honestly claim by actual proof and test of service that no other shingles have been introduced that will equal "EASTLAKE."

Let us know your roofing problem and we will help you find a solution. It will cost you nothing and it will be a pleasure to us.

Investigation is worth while. It pays to know.

Write for our free booklet to-day.

SEED OATS!

If the farmers of the Maritime Provinces, Quebec and Ontario want to make sure of getting the highest possible grade of seed oats for the Spring of 1913 apply to us at once. To prevent a repetition of the disaster that befell so many farmers last year by sowing devitalized grain, we have stored at Point Du Chene and Pictou 50,000 bushels of **large, selected, separated White Seed Oats, true to name and free from noxious weed seeds.** It will be the farmers own fault if they do not procure good seed as the extra yield of these oats pays twice over cost of the seed.

Our firm name is stencilled on every bag. Do not allow the dealers to give you other than Read's oats for seed.

JOSEPH READ & CO., LTD., Summerside, P. E. I.

FREE TO BOYS AND GIRLS

This beautiful Gold Finished Watch in **Gents'** and **Ladies'** size hunting case, stem wind and set, the case is engraved in a large variety of designs. The Locket is complete with chain and strong clasp, correct length and suitable for photographs. Your choice of these three articles is given **Free** for selling 35 sets of our embossed post cards at 10c. per set (6 cards in a set). These are fast selling cards—not trash, and are composed of Easter, St Patrick, Valentine, Views, Comics and Birthday, etc. Send us only your name and address and we will send the cards; when sold return the $3.50 and your premium will be sent at once post paid.

Dept. N, 363 Spadina Ave., Toronto, Canada

ed in some instances; in other neighborhoods they are a failure.

Probly the most satisfactory solution of the meat problem lies in the home preservation of meat when it is most plentiful. There are many reasons in favor of this method. It is not so difficult to do successfully as most people who have never given it a trial imagine. The work of preserving generally comes in the late fall or winter, when the country housewife has the most leisure. And, best of all, this preserved meat is so easily prepared for the table that it lightens the work during the summer months just when it is most appreciated.

The proper time to preserve meat is when it is perfectly fresh. The aversion so many people have for home-preserved meats arises from the fact that they preserve it as a last resort after it has been kept to the very verge of spoiling.

Canning Meat—The same rules hold good in canning meats as in vegetables or fruits. Sterilize the cans and pack closely with the meat cut into suitable pieces; and a teaspoonful of salt to a quart can, fill with cold water and put on the cover, omitting the rubber. Have a rack of wooden slats made to fit the bottom of the boiler, or cloths may be used; never allow the cans to stand directly on the bottom. Seperate the cans with cloths or papers to prevent there jarring together and cracking the glass. After arranging them in the boiler pour in cold water until it reaches about two-thirds the height of the cans and cover closely. Bring to the boiling point and boil steadily, but not violently, for two and one-half hours.

When the boiling is completed draw the boiler to the back of the stove; remove the top from each can, fill with a little hot water if the contents have shrunk, and seal. Return the cover to the boiler and let the cans remain in the water until cool enough to handle comfortably.

Canned Beef—Cut the beef into two inch cubes and add some finely chopped suet when packing it into the cans. When cold the suet rises to the top of the can, forming a rich cake.

This beef may be served in any way that freshly boiled beef is used. It is excellent cold, cut in thin slices. It may be heated throughly and served with brown gravy, or is good served hot with dumplings.

Canned Pork—Lean portions of the fresh pork are most delicious canned. Prepare the same as beef. The meat may be eaten cold, served hot, or will form the foundation for the finest of sandwiches.

Canned Chicken—A few cans of chicken are extremely convenient for serving on emergency occasions. This work, however, generally comes during a busy season, when the young cockerels are just right for serving. For ordinary purposes leave the meat on the bones If desired for salads or sandwiches, the meat may be removed from the bones before canning, as it is then requires less space.

Canned Ham—After the ham has been cured in the usual way cut it in slices, remove the rind and pack in cans. Can exactly like other meat. This is excellent for sandwiches or to eat cold.

Fried Ham—Cut the cured ham into desirable slices and remove the rind; have ready a good jar; place the ham in a frying pan over a quick fire and fry until it is heated through and slightly browned; pack the slices in the jar, pouring over it the fat from the pan. When the jar is filled take a plate that will fit inside the jar, invert it over the meat and plare on it a weight so that the fat covers the meat.

To serve, reheat in the frying pan. This will keep well if kept in a cool dark place. After opening it to use, if desired to be set aside for awhile, pour over the top a little fresh melted lard.

Sliced Ham—Prepare the ham as for frying, but pack without cooking in a stone jar, taking care to pack evenly and closely. Pour over it melted lard until the fat rises round a weighted plate inverted over it. If packed in this way it is advisiable to use very small jars, so that only a small amount need be opened at once. If left longer than a day or two after being opened re-cover with lard.

Baked Sausage—After mixing the new sausage, pack as much as desired preserved at once in small jars, leaving a couple inches space at the top; cover the jars and place in a moderately hot oven. Bake for two hours, when the fat from the meat will have risen to the top, forming a thick covering for the meat when cold. Set away in a cool, dry place and it will keep well all through the succeeding warm months. To serve, cut in slices and fry as with fresh sausage. This will not keep long after being opened unless covered each time with fresh lard.

Any of these preserved meats will keep admirably through the summer months and will help quite wonderfully toward lessening the housewife's work during a hurried season, furnishing a pleasant variety for the table and lowering the annual meat bill.

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid, causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous Free Trial Treatment of my well-known, reliable Chronicure, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. Chronicure succeeds where all else fails. Chronicure cleanses the blood and removes the cause. Also for a weakened, run-down condition of the system, you will find Chronicure a most satisfactory general tonic that makes you feel that life is worth living. Please tell your friends of this liberal offer, and send today for large free package, to MRS. M. SUMMERS, Box B. 309—Windsor, Ont.

Big Ben

Big Ben—Two Good Alarms in One

Take your choice in Big Ben. He rings either way you wish — five straight minutes or every other half minute for all of ten minutes unless you switch him off. He's two alarms in one.

If you're a light sleeper, turn on the half minute taps before you go to bed. If you sleep heavily, set the five minute call. You can slumber then without the get-up worry on your mind.

When morning comes, and it's announced by Big Ben's jolly bell, you can't help getting up at once, for Big Ben never fails to get you wide awake.

Big Ben is really three good clocks in one, two excellent alarms and a fine time-keeper to keep in any room and tell time all day by.

If you have got to get up bright and early, if you have to get your help in the field on time, ask for Big Ben at your dealer's and try him for a week. You'll never want to be without him afterwards.

Big Ben stands seven inches tall. He is triple nickel-plated and wears an inner vest of steel that insures him for life. His big, bold figures and hands are easy to read in the dim morning light. His large, comfortable keys almost wind themselves.

He rings five minutes steadily or ten intermittently. If he is oiled every other year, there is no telling how long he will last.

He's sold by 6,000 Canadian dealers. His price is $3.00 anywhere. If you can't find him at your dealer's, a money order mailed to *Westclox La Salle, Illinois*, will send him anywhere you say duty charges prepaid.

Potash Promotes Prosperity.

Your soil must contain an available supply of **POTASH** sufficent for the plant's requirements, otherwise you cannot hope to grow a maximum crop.

POTASH increases quantity; promotes maturity; improves quality and produces profit.

POTASH can be obtained from all reliable fertilizer dealers and seedsmen in the highly concentrated forms of

MURIATE OF POTASH and SULPHATE OF POTASH

Secretaries of Agricultural Societies and Farmers' Clubs, who may be desirous of having one of our representatives address a meeting on the subject of fertilizing, are requested to communicate with us as soon as possible so that date may be arranged.

What Is The Matter?

Talking with a farmer not long since about the present demands upon the man who tills the soil, he said:

"Sometimes I get almost discouraged. It seems as though the colleges and you editors were crowding us farmers along faster than we know what to do. It didn't used to be so. The demand for this and that change are coming thicker and faster."

We do not wonder that some farmers feel like this. The minds of men are getting greatly stirred as to the necessity for more and better knowledge, for better methods concerning the handling of our farms. The very conservative farmer, like our friend above quoted, does not feel just clear that these things are just right, so they feel uncertain. Like honest men, they want to do what is for the best. They do not feel like admitting that they have been wrong in their understanding of their soil. They will confess that it does not act as it used to twenty-five or thirty years ago. Like most men, they incline to the easiest conclusion and say the seasons are to blame. And so they say, "What's the matter?"

To our mind, all these things come to one point, that is, decline in the producing power of the farm; in other words, loss of fertility. All this has taken place unconsciously to the mind of the farmer. He has not increased his knowledge as fast as these disastrous changes have taken place. He has drifted along, doing his farming mechanically, plowing in the same old way; sowing and planting in the same old way; and so it has gone.

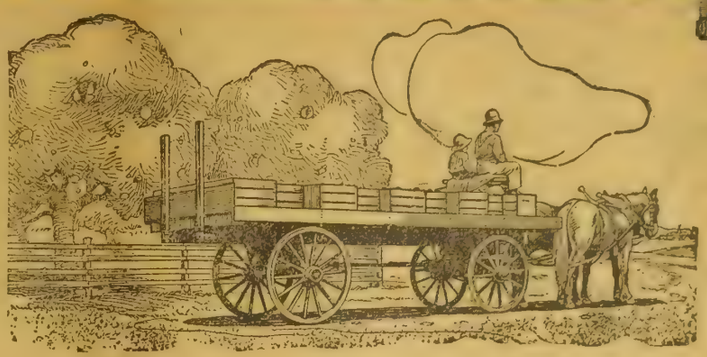
Now he is troubled on two sides. (1) By the growing stubbornness of his soil. "It don't act as it used to," he says. "What's happened to it?" (2) He is troubled by the colleges and those agricultural papers that dig down to the reason of things. They keep him stirred up telling him he must readjust his mind and judgment to the changed condition of the soil; that he must do the things that will bring back this fertility that the farm has lost. That worries him. He more than half suspects they are right.

Now all these things would appear more clear and capable of solution if the farmer in days past had devoted some time to a study of the soil. Right now changes must be made, remedies applied, and the farmer feels as did our friend whom we quoted at the beginning, "almost discouraged."

But there is a way out. Thousands of farmers have found it. What is it? Commence at once to make a serious study of your farm with the determined purpose of finding out why fertility has declined. Probably there are a number of causes, but the principal one is that for years more phosphate and nitrogen have been taken out of the soil than have been put back. Hoard's Dairyman has been talking a long time to its readers about the importance of apklying two things especially to their soil—phosphate and the right form of lime. Only occasionally have we heard of a neighborhood of farmers who have clubbed together and sent to Tennessee for a carload of raw ground phosphate. Local dealers do not keep it, and if got, it must be got by the carload. So it is with ground lime stone or marl. It is like pulling teeth to get a farmer to turn under a good crop of clover or alfalfa in the fall so as to add to the humus in the soil. It takes knowledge and then pluck to do the right thing.

Two main things must be done to save our farms. (1) We must know more than we do about the soil. (2) We must have more courage to do as well as we know or may know. That's what's the matter. We never heard of a man who grew poor because his soil grew rich. Have you? —Hoard's Dairyman.

IHC Wagons Are Tough



DID you ever notice, when one of the wheels of your loaded wagon dropped into a rut or bumped over a stone, how the seat springs gave and rebounded, almost throwing you off? That is an indication of the shock and strain that the rigid spokes and axles have to stand whenever the wagon is traveling over a rough road or through a field. Even on a smooth road there is always the crushing strain of the load, affecting every part from the top box to the lowest point of the tire. I H C wagons

Petrolia Chatham

take these stresses and strains as a matter of course. They are made to stand just that sort of work. From neckyoke to tail board they are built of selected, air-dried lumber, strong and tough, bending to strains but coming back as straight and true as ever when the load is removed. Besides being tough, I H C wagons are light running. The wheels have just the right pitch and gather, and run true. All skeins and skein boxes are paired. The running gear is assembled by skilled workmen whose wages depend as much on the quality as on the quantity of the work they turn out. Machine work, being more uniform and a great deal faster, takes the place of hand work wherever possible. Consequently, I H C wagons are practically all of the same high standard of quality throughout.

You cannot do better than to equip your farm with I H C wagons. The I H C local agent sells the wagon best suited to your work and your conditions. See the wagon at his place of business and get catalogues and literature from him, or, address your request to the nearest branch house.

Test Soil For Acidity

"I have seen fields so dotted that litmus test would show decided acidity in one place, when forty feet away I would not get the reaction. So it is not always safe to assume that the entire area of any field is uniform. The thing to do is to make the test in several different places, and if sourness is indicated by the coloring of the litmus paper apply lime. And it will do no harm to apply it over the entire area.

Where alfalfa, or any of the other legumes fail to prosper it is well to determine whether or not the soil is acid. Because the enormous quantities of vegetable matter turned under, lime is becoming an important factor in keeping soil in fit condition."

This is a fair, true statement of the situation on a very large percentage of dairy farms. Dairy farmers should understand that all land that has or is receiving considerable manure or turned under green stuff naturally evolves an organized acid of itself. This is largely the reason why farmers are so frequently disappointed in growing clover or alfalfa, although alfalfa in southern Wisconsin at best will arrive where red clover will not. But the one thing needed with our soils is more lime both to correct acidity and to promote a larger degree of nourishment to plant life.

"A correspondent in our paper of July 4 reports having used acid phosphate in his stables upon the manure, with the result of a disappearance of flies. He asks, "Will raw rock do as well?" Having seen the same fact stated elsewhere (i. e., that the use of acid phosphate caused flies to be less plentiful), I reasoned that anything destructive of flies on the manure heap must be a soluble chemica, which either destroyed the egg or the maggot, or so changed the ferment that it no longer was fit for the nourishment of the fly. This points to the free sulphuric acid in the dissolved rock, as the fly destroyer. Following out this conclusion, I have tried sprinkling the manure pile, as well as the stable floor, with a solution of one pound of commercial sulphuric acid in 100 pounds (12½ gallons) of water, and find that its use greatly lessens the number of flies and does away with the ammoniacal odors."—W. B. Cleaves, in Stockman and Farmer.

Pride in Your Garden

will be natural, and justified, if you plant Ewing's Reliable Seeds and give them proper care. The bumper crops which, for forty years or more, have been grown from

EWING'S Reliable Seeds

are explained by the care which we take to give our customers only specially selected seeds that are clean, fresh, healthy and true to type—seeds that produce grains, roots, vegetables and flowers of which the growers may well be proud. **Write for our handsome illustrated catalogue,** and if your dealer hasn't Ewing's Seeds order from us direct. 22

Good Square Meal For Hogs

What about a square ration for fattening swine? The popular standard for every 1000 pounds weight is 31 pounds dry matter, four pounds protein, and 24 pounds carbohydrates and fat; this for daily ration. Corn meal and middlings are popular hog foods. The analysis of the former runs 85 per cent dry matter, 6.5 per cent. protein, 68 per cent. carbohydrates and fat. Wheat middlings run 88 per cent dry matter, 14.4 per cent. protein, 53 per cent. carbohydrates and fat. Suppose we start with 20 pounds corn meal and 17 pounds middlings. In the 20 pounds meal there would be 17 pounds dry matter, 1.3 pounds protein, 13.6 pounds carbohydrates and fat. In the 17 pounds middlings there would be 14 pounds dry matter, 2.44 pounds protein, nine pounds carbohydrates and fat. This placed in tabular form would be:

FOOD VALUE OF MEAL AND MIDDLINGS.

	Dry matter lbs.	Protein lbs.	Carbohydrates & fat lbs.
20 lbs. corn meal...	17	1.3	13.6
17 " middlings...	14	2.44	9.
Total.....	31	3.74	22.6
Standard.....	31	4.	24.

This is a bit low on protein and carbohydrates and fat, and two or three pounds linseed meal added would be close to the standard and also prove valuable in keeping hogs healthy. Notice that these figures are for for 1000 pounds pork, and if the hogs weigh 200 pounds each, this would be the daily ration for five of them. Figures, too, are for fattening animals in the second or medium period. At the start an even stronger ration should be provided. Again, this is for animals fed wholly on mill products. Actually, the farmer should plan to provide some succulent food like clover or June grass pasture, and possibly roots in winter.

FEED NECESSARY FOR SHEEP.

As regards fattening sheep, the approved standard ration is 25 pounds dry matter, 3.5 pounds protein, 15 pounds carbohydrates and fat for 1000 pounds weight. Starting with clover hay, which is a recognized product of merit for sheep, we note good clover hay runs 84 per cent. dry matter, 6.8 per cent. protein, 37 per cent carbohydrates and fat. If we feed 20 pounds of this, there would be 16.8 dry matter, 1.36 pounds protein, 7.56 pounds carbohydrates and fat. For a grain ration, various feeds could be selected, but suppose we take a wheat mixed feed, which runs 90 per cent. dry matter, 14 per cent. protein, 50 per cent. carbohydrates and fat. If we take ten pounds of this wheat mixed feed there will be nine pounds dry matter, 1.4 pounds protein, and five pounds carbohydrates and fat. Now place these in tabular form and note the result:

FOOD VALUE OF SHEEP RATION.

	Dry matter lbs.	Protein lbs.	Carbohydrates & fat lbs.
Clover hay.....	16.8	1.36	7.56
Wheat mixed feed..	9.	1.4	5.
Total.....	25.8	2.76	12.56
Standard.....	25.	3.5	15.

This shows a short ration on protein and carbohydrates, when compared with the standard. The addition of two or three pounds corn meal would bring it much closer. Note that these figures again are for 1000 pounds fattening sheep, or for ten sheep weighing 100 pounds each.

Readers are reminded they need not consider these rations mentioned as models. The idea has been to show how a ration is balanced. Just what a man will feed depends on many factors. Examples given above will help to figure good value no matter what the combination may be.

The Wood Cutting Season Is Here

Save money and labor by getting a Sussex Wood Cutter. Manufactured in four different sizes; two Long Swings, Short Swing and Flat Roller Table. Tables of all are built of the best seasoned hardwood, and strongly braced with steel bars. The greatest care is exercised in the making of the iron and steel work. The Balance Wheel is a solid web and weighs 180 lbs., thus allowing it to be operated with a minimum amount of power.

Every machine is inspected and tested before leaving the factory by painstaking and competent men, and is guaranteed for one year against all defects in workmanship and material.

Handling Bulls of a Jersey Dairy Farm

A subscriber recently asked through the columns of the Maritime Farmer concerning the handling of bulls. On this farm "the old man" has most of this to do, and I have reached the conclusion that the bull is best handled by being tied while in the barn. I prefer two rings in an old bull and prefer keeping on the horns (sawing off the tips if mean), and having a chain with a ring and swivel around the horns to which the tie chain is snapped by first passing through the nose rings. These rings should be replaced frequently. They cost but little, and the danger should they break in a crisis is considerable.

I keep my present bull chained in one end of a box stall while in the barn, but in all favorable weather keep him loose in a good tight paddock with shed to which he can run.

We are short of barn room, and so for this winter have had to keep him outside pretty nearly all of the time. He has been in the barn only three nights up to January 24th, and for all I can see is more active and much more certain than ever before. I notice that he is a little more independent now, so would judge that there might be a little more danger of his going wrong if left too free.

The one thing that I always try to impress upon the bull is that there is no boss except man, that no bluffs go on the bull's side and that absolute obedience is expected. As a youngster it took a club once or twice to convince him of the fact, but of late a slap is enough to remind him of his position.

The thing that I always try to avoid is any semblance of retreat and the position to be most studiously avoided is one where a quick move on the bull's part would corner the handler against a stall, gate, fence or other obstruction. This is a lesson I had driven into me by a previous bull.

One thing more: a bull will sometimes be in too much fear of his handler and fancy himself cornered and do things then that he would never do if the overbearing fear were not present. So-called dicipline can be carried too far. Firmness may verge on roughness at times, but should stop far short of abuse.

Old hands tell me the dangerous age with a bull is at two years; that if he can reach three years old without becoming unduly enraged, he will probably never become more than potentially dangerous.

The only safe bull of course is a dead bull. All others can do mischief if aroused. The prepotent bull is usually full of life and vim, and is the most apt to resent any curtailment of privileged authority.

We are still mourning the untimely demise of a bull that we now know was truly great. My predecessor killed him because he got cross.

Why Some Bulls Get In Mischief

Some bulls are not ringed simply because their owners dislike the rather disagreeable job of doing the ringing. I remember my first experience at the work. The bull had found his way to a neighbor's herd. He was driven nearly home when he went back to the neighbor's barn. A halter was put on him and he was tied to a post. A pocket knife put a hole in the nose, but having no ring a piece of heavy wire was made to take its place and the bull was led home and the ring inserted. There are instruments made especially for ringing bulls but they are not an absolute necessity. Ringing a bull is neither difficult not dangerous although not altogether bloodless.

Why are my bulls never cross? Possibly it is good luck in great measure, although their general management doubtless has something to do with it. They are never overfed. A bull that is constantly in high flesh may attract the admiration of beholders but his temper will be something like that of an overfed child. High feeding coupled with idleness has caused more bulls to become unmanageable than anything else, although ill-treatment, worrying by dogs, the presence of strangers, pasturing horses in the same field, timid managers, inherited disposition and the particular breed of cattle all have their influence.

The problem of furnishing exercise for the bull is at times a perplexing one. In some respects he would do better in the field if it were not for his breechy disposition. Some breeders report splendid success by blindfolding with a piece of heavy leather through which horns and ears protrude; or in case the bull has no horns the hood is fastened to a strong halter. He may occasionally become lost from the herd but he will be found somewhere in the proper field. Others use the bull two or three times a day on a tread-power. This method not only gives the bull an opportunity to work off some of his superflous energy but also to pay at least a part of his board bill by running machinery of various kinds. A good plan is to stretch a wire rope between two trees and tie the bull to a ring that slides upon the rope.—W. C. Jeffries. in Ottawa Valley Journal.

Housing Swine

In the class in "Swine Production" at the Washington State college the question of hog houses recently came up. These are the conclusions:

Hog houses need not be elaborate or expensive, but they must be good for the purpose. A good house:

1st. Is dry and clean inside.
2nd. Is well ventilated.
3rd. Admits plenty of light.
4th. Is free from drafts.
5th. Is comfortably warm for the hogs.

Such a shelter will avoid trouble from colds, rheumatism and pneumonia. It will not be a breeding place for disease germs. If your hog shelters are not satisfactory, see how well and how cheaply you can make them fit these conditions.

In our damp winter weather, dryness is absolutely essential. Don't give too much bedding and change it frequently by cleaning everything out of the sleeping pens. Scatter air-slaked lime about at frequent intervals. Use a coal tar dip or crude carbolic acid solution and spray the pens every few weeks.

Keep lice off the hogs. Do you like to go into your hog house? Why not? Fix it so it suits you and see what the pigs say.

No Milk After Weaning

I have successfully raised pigs and kept them in fine condition after weaning without any milk. They were first taught to eat before being weaned. Dry feeding saves both time and labor. I used self-feeders and water fountains and fed the following mixture: Corn meal, bran, shorts and tankage. Oil meal may be substituted for the tankage.

The other method was to fix the feed into a slop, fresh each day. If convenient, it is a good plan to pour boiling water over the feed, then thin to proper consistency. A clover pasture is a great aid in the proper development of pigs. In warm weather good shade is a necessity.—S. J. Jackson.

The Farmer's Butter Parchment Offer.

The offer of the Maritime Farmer to furnish butter parchment at wholesale prices to its readers has been bringing in numerous orders and many more enquiries. Customers who have investigated the proposition are more than pleased with the prices quoted and the quality of the goods supplied. One parchment user told us that the quality of the parchment he had been buying was away below par and his is only the experience of many. Possibly there is no commodity offered for sale to-day, concerning which there is more deception practiced on the public than in the case of butter parchment. In many cases the dealer is not to blame as he is supplied with paper that has no claim to be labelled "pure parchment." The Maritime Farmer's guarantee goes with every sheet of paper it sells. The stock is bought direct from the largest dealers in Germany and out of millions of pieces of parchment handled by us not one sheet has given cause for complaint. Write us for prices before buying. We can save you money and at the same time give you a genuine article.

The N. B. Fruit Grower's Association

convened in one of the exhibition Board rooms on the 8th inst at 2 o'clock P. M.

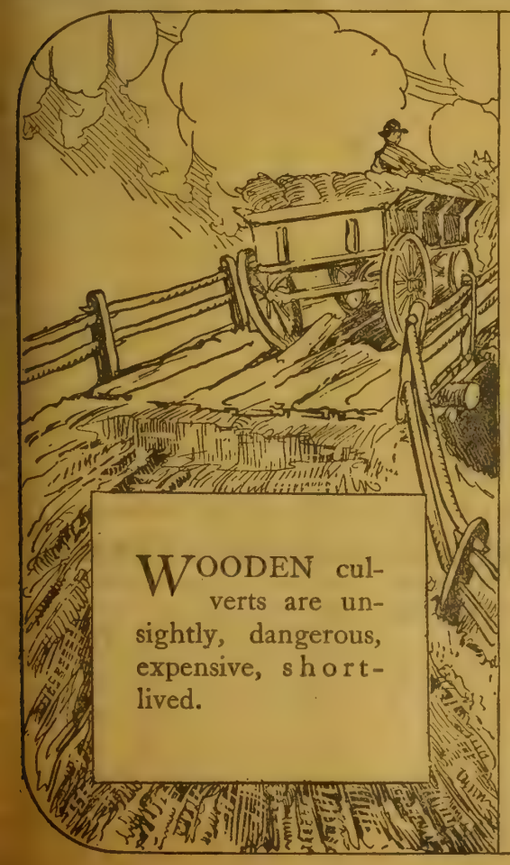
C. N. Vroom, president of the association, presided and read the following address:—

The bye laws of the association were read, section by section and recommendations were made to have certain necessary revisions made at the next annual meeting.

It was resolved that a large fruit exhibition be held in the city of St. John about the first of November of this year.

The election of officers resulted as follows:—

President—S. L. Peters.
Vice-President—W. B. Gilman.
Secretary—A. G. Turney.
Treasurer—Henry Wilmot.



Which kind of a culvert does your waggon cross?

DOES the road *you* use pass over rickety, dangerous wooden culverts, that are constantly in need of repairs and often washed away entirely? Or is it carried safely across the low places by modern, everlasting culverts? Build your

CULVERTS OF CONCRETE

which not only cannot be washed away, but actually grow stronger with age and use.

Every farmer owes it to himself to insist that the money he pays for road-taxes be spent to the best advantage. As a ratepayer, he is entitled to the best roads that can be made with that money. When culverts are washed out, and the road rendered impassable, he not only suffers inconvenience but may also be caused financial loss by inability to get necessary supplies in time for spring planting. And at best, with wooden culverts, part of the money that should be used to make better roads must be spent every year for repairs.

Insist upon Concrete Culverts

It will pay you and everybody else in your county.

Canada Cement Company Limited

Some Details of N. B. Experimental Farm

W. W. Hubbard, superintendent of the new dominion experimental farm at Fredericton says that arrangements are completed for the erection of the farm buildings and work will be started as soon as possible in the spring.

The buildings so far arranged for include: A main barn 50 feet wide by by 100 feet long with root cellar and silo; a dairy barn, 41 feet wide by 102 feet long, constructed upon the most sanitary lines for milk production; a horse barn 30 feet wide by 90 feet long; an extensive piggery; several poultry houses and a dairy building where butter and cheese will be made.

It is intended that there shall be kept on the farm about 100 cattle, of which forty-eight will be milking cows.

The breeding of heavy horses will also be carried on, and of the twelve or fourteen horses kept for farm work a large proportion will be mares. Two of the mares now on the farm were bred to H. C. Jewett's Clydesdale Sorbie Boy. The horse barn in addition to providing stall room for the work team will also have boxes for brood mares and colts.

A water system will be installed but it has not yet been decided whether the supply will be obtained from Mill Brook which flows through the farm from springs on the Adams lot, or by boring. In any case a water tower will have to be erected through the various buildings and fire protection provided.

A residence for the superintendent will also be built this year, but the plans are not as yet entirely settled. It is probable, however, that the house will be of brick of colonial design and placed on the hill top on the Jewett lot where it will command a magnificent view and be in plain sight of the city.

F. E. Buck, B. S. A., the expert in charge of landscape work for the dominion experimental farm system, will visit Fredericton in the early spring and lay out the ornamental grounds, including roads, ornamental and shelter trees, shrubbery, etc. Mr. Hubbard says that extensive orders have already been placed for fruit have already been placed for fruit and ornamental stock, which will be planted in nursery rows this year. No orchard planting will be done until 1914 as this summer will be occupied in getting the orchard site in readiness.

As soon as the frost is out of the ground extensive drainage, road building and land clearing operations will be commenced and it is hoped to have one hundred acres of new land in readiness for cropping next year. Corn, roots and potatoes with the coarse grains, will be the principal crops this year and the experimental work proper will not start until sufficient land is cleared and fenced to enable its start upon a systematic basis.

Now Is The Time

Now is the time, when work is slack during the winter months, for the farmer to see that his tools are in condition for the spring work. It will cause a serious loss of time to wait until the season opens before getting his tools ready for their work. They should be carefully gone over, all burrs tightened and set, all necessary repair pieces secured and put in place, and everything made ready, even to the removing of the rust and dirt on all bearings. It would also be well at this time to lay in a supply of the bolts of various sizes that will probably be needed during the season. This will mean quick repairs and a saving of time when it is valuable.

EVERY WEAK MAN

Can be Made Strong

It is pitiable to think of the vast number of people who go from day to day suffering mental and physical torture as a result of their weakness, while right at their doors other men are being cured of the same disease. One who has not known it himself cannot realize the feelings of a man in the advanced stage of the nervous debility, nor does he hear it, for these men do not talk of their troubles. And yet I have thousands upon thousands of grateful patients who are willing to testify to their cures.

Dr. McLaughlin's Electric Belt

is an absolutely positive cure for all forms of nervous debility, loss of memory, varicocele, weak stomach, and all those physical and vital weaknesses, confusion of ideas, kidney and allied complaints, rheumatism, sciatica, etc., etc.

It has cured thousands every year after every other known remedy has failed. The fact is medicines cannot cure these complaints, as you will know when you have tried them. Electricity—which is nerve force is the power that has been drained from the system, and, to cure, it must be replaced. This Dr. McLaughlin's Electric Belt will do. It is the crowning triumph in electrical science and its cost is within the reach of every sufferer.

The Dr. McLaughlin Electric Belt is a cure for all signs of Breakdown in Men and Women. The Vitality of the body is Electricity—the force in the Nerve Cells. My Electric Belt will give you back this power and enable you to fight on in the Battle of Life !

The Dr. McLaughlin Electric Belt cures Neurasthenia, Hypochondria, Nervous Prostration or Nervous Weakness, Headaches, Sleeplessness, Stomach Trouble, Indigestion, Constipation, Weakness of the Kidneys, Lame Back, Rheumatism, Lumbago, Sciatica, Neuralgia, Poor Circulation, Urinal Trouble, Weakness of the Organs, Night Losses, all evidences of Permature Decay.

BLACK RIVER, N. S.

Dear Sir,—It is with the greatest pleasure that I write to you to let you know what your Belt has done for me. I have never found anything to equal it for my trouble. The greatest thing that seems to me is when people come around and say, "Why, you can get about better now, and you have no more asthma." Then I say that I took medicine for 15 years, but Dr. McLaughlin's Electric Belt cured me in less than six months. Now, Dr., I want to thank you from the depth of my heart for what you have done for me and whenever I get an opportunity to recommend your Belt I will do so. Wishing you every success, I remain, yours sincerely,

A. E. SPITTLES.

TO YOU WHO ARE WEAK and want to regain your youth, who want to feel like you did when you were young, I offer a book which will show you the road to happiness—book of 80 pages, which is brimful of the things you like to read, which will give you courage and enlighten you as to the cause and cure of your troubles. It will point out the pitfalls and guide you safely to a future of strength and vitality. It is beautifully illustrated. It tells what others have suffered and how they have cured themselves. It is free. I will send it closely sealed, without marks, if you will send this coupon. If you are not what you ought to be SEND FOR IT TO-DAY.

Gates' Nerve Ointment For Frost Bites

C. Gates, Son & Co., Middleton, N S.

Gentlemen:--I had the misfortune to freeze my toe which caused me a great deal of suffering, and although I had it treated, yet without success till I used your Nerve Ointment, which has completely cured it, and I have no hesidency in recommending it to others as the best I ever used,

Yours sincereiy, Matthew Wood, Point Phillip, N. S.

Furnishing Cows on Shares

In reply to the following inquiry Hoard's Dairyman says:

"A," professional man, wishes to invest some money in registered Holstein cows and place them with "B," a dairyman, on shares. "B" furnishes everything except the cows, (this includes a better bull than the cows are to be, feed, care and etc.) What share shall each receive of the profits?

It is the intention for "B" to raise the heifers to cows and sell the bull calves as soon as he can get $50 for them. Can you give me any information as to what shares each should have? If "A" gets one-half of the stock increase and none of the milk, would that be enough?

If "A" loaned "B" $2,000, taking a mortgage on a number of pure bred dairy cows as security, "B" would probably pay 6 per cent. or $120 per year for the use of the money. The mortgage would cover cows of greater value than the amount of money loaned. "B" would of course stand all expenses and get all returns from the cows.

If "A" loans "B" $2,000 worth of cows under contract that "B" will return the cows or their equivalent in other stock or cash at the expiration of the contract, "B" is under no greater obligation to "A" than in the first case nor has "A" any greater risk. "A" is entitled to the equivalent of the interest on his investment. However, if "A" assumes all risk of loss on the cows so placed, he is entitled to an additional return, the amount of which will depend on the size of the risk. If "B" is known to be a careful, conscientious dairyman in whose hands the cows will receive the best of treatment and care, "A" would probably be content with less return than if "B" were known to be careless or reckless in handling his affairs. "B" should pay proportional to the risk. Under ordinary circumstances, one-half of the stock increase should be ample pay for the use of the stock and the risk assumed by "A."

Farm Whitewash

The Australians use a whitewash which it is claimed will not rub off. It is prepared in the following manner:

Dissolve two pounds ordinary glue in seven pints of water and when all is dissolved add six ounces of bichromate of potassium dissolved in a pint of hot water. Stir the mixture up well, and then add sufficient whiting to make it up to the usual consistency and apply with a brush in the ordinary manner as quickly as possible. This dries in a very short time, and, by the action of light, becomes converted into a perfectly insoluble waterproof substance which does not wash off even with hot water, and at the same time does not give rise to mold growth, as whitewash made up with size often does. It may be colored to any desired shade by the use of a trace of aniline dye or powder coloring, while by the addition of a small proportion of calcic sulphite its antiseptic power is much increased.

A recent United States consular report states that a traveller in the rural districts of Uruguay will be struck by the fine white color of the farm buildings even during the wet season. This neat effect is secured by the use of a whitewash prepard by macerating the sliced leaves of the common cactus in water for twenty-four hours, producing a liquid of creamery consistency, to which lime is added and the whole well mixed. When applied to any surface, be it of wood, brick, iron or other material, a beautiful pearly white appearance is produced, which will endure through storms and frosts for many years."

The N. B. Farmers and Dairymen in Annual Session

(Continued from page 346)

soil was very much more thoroughly done. Weeds were kept down, rotation was followed and the very best results obtained.

As an illustration of what can be done, some seven years ago Professor Holden of Ames, Iowa, perhaps the greatest corn expert in the world, went out and inspected the corn fields and found less than eighty per cent. of a perfect stand in the hundreds of farms inspected; that the cultivation was conducted in a most perfunctory manner; weeds were rampant and crops exceedingly small. Through the persistent endeavors of Professor Holden and his assistants, it is conservatively estimated that they have added $30,000,000 per year to the value of the corn crop of the State, and now fields would average ninety-five per cent of a perfect stand.

Railways, banking associations and manufacturers of agricultural machinery are vying with each other in the United States in providing money for the extension of this kind of work. The Soo Line, Great Northern and the Northern Pacific all have crops of agricultural experts under the direction of highly paid officials, while the International Harvester Co. has laid aside $1,000,000 for the same purpose, and have placed Professor Holden at the head of the work.

"If we in Canada are going to hold our own as our geographical position and quality of land would permit, it is necessary for us to see to it that we adopt some vigorous method. The present Minister of Agriculture deserves great credit for his outspoken and liberal policy in making it possible for these advanced methods to be pursued in the Province of New Brunswick," declared Mr. Elliott in conclusion.

Following Mr. Elliott's address the meeting settled down as a heart to heart conference between the Secretary of Agriculture and delegates from various agricultural societies.

The first subject taken up was that of drainage, and the meeting was unanimous in expression of the importance of this subject, which it was felt had up to the present been sadly neglected. It was decided to ask the government to at once buy a traction ditcher, so that operations can be commenced without delay,

The question of clover hullers was then discussed, and Secretary Dagget announced that Hon. Dr. Landry, the Commissioner for Agriculture, had decided that the department would aid in the purchase of hullers. The announcement was received with applause, and the opinion expressed that material aid in the matter of seed would result to the farmers.

Dairy Superintendent McDougall was the principal speaker on the subject of dairying, and he said that by taking the matter up vigorously and persistently within a few years the problem of lack of feed, which is the weak point of the industry at present, could be overcome.

Secretary Daggett announced that Mr. N. W. Eveleigh, of Sussex, had been appointed to a position on the dairying branch staff of the Department of Agriculture, and will give especial attention to the work of the creameries. Announcement was also made of the appointment of Mr. H. B. Derost, of Carleton County, to take charge of the work in connection with drainage, fertilizers and bee culture. Mr. Derost is a graduate of Macdonald College, Quebec, and both he and Mr. Eveleigh are well fitted to take up their respective lines of work.

The matter of the annual returns made by the Agricultural Societies to the Department of Agriculture was discussed and some change will likely be made in this regard.

When the question of horticulture was taken up, Mr. Turney, Provincial Horticulturist, announced that the department was bringing in a large number of carefully selected trees which would be sold at cost to the farmers, who were strongly advised to buy their young stock through the department.

It was well on towards 2 o'clock Friday morning when the meeting concluded.

The results of the conference were eminently satisfactory to the representatives of the Farmers' & Dairymen's Association.

The Quiet One

Your hand and ear are wonderful judges of mechanical perfection. They detect poor construction no human eye could see.

Five seconds after you touch the crank of the quiet running Waterloo Boy cream separator you know it is perfectly designed, otherwise it could not run with such remarkable ease.

While you hold one ear within a foot of a Waterloo cream separator running at full speed you can hear the ticking of a watch held near your other ear.

That is excellent proof of perfection.

Insist on getting the clean skimming, easy running Waterloo Boy if you want the best.

Shelter for Farm Tools.

Tool protection necessarily requires considerable room, more than some farmers can easily provide. The farmer who is able to own a large tool shed can run his implements in it at the end of the season and leave them there until he wants them again next season. But the farmer who feels that he is not able to own a shed for his implements must do a little planning in order to get all of them out of the weather. He can and should utilize all the space he has by planning to store his implements in as little space as possible.

Some of the machines may be taken apart and thus stored in a very small space. Those that cannot be taken apart easily must be run together as closely as possible. The hay rake may be condensed by removing the wheels and tongue; the mower can be placed in close quarters by taking off the tongue and sickle-bar. The spike tooth harrow can be taken apart and hung upon a wall with railroad spikes. The corn planters and the cultivators will not require much room if dismantled. It is often quite a job to find room for the binder, but by taking off the reel and bundle carrier the space needed for this machine may be much lessened. An effort should be made to get the binder under shelter by all means, as the elements will quickly play havoc with this complicated implement.

Often there is considerable room in the barn loft that may be utilized for the storing of plows, and those tools which have been taken apart. When implements are oiled or greased, taken apart and packed away, try to place the parts so that you can get at those you will need early in the spring without having to move the ones you will not need until late in the season.

In the wagon-shed or driveway, or in any shed for storing tools, a system of ropes and self-locking pulleys can be used to good advantage to hoist some of the tools out of the way. The wagon boxes, hay rack or hog rack may thus be removed entirely out of the way and they can be raised or lowered easily directly on the wagon.

Sometimes a farmer will permit good shelter for his tools to go unused because he does not realize that he has the shelter. I know several farms on which there are one or more old sheds filled with nothing but worthless rubbish, while the farming implements stand in the fields. By clearing the rubbish out, and then repairing the leaky roofs and replacing loose boards so as to make the sheds dry, these old buildings would become valuable, considering the use to which they could be put. A tool house does not need to be so well constructed as stock buildings, as the question of warmth need not be considered. A tool shed needs to be very dry, of course. A good dry floor can be made by hauling a few loads of cinders.

Stearlized Milk.

In sterilized milk there are no bacteria or spores, as both of these have been destroyed by the milk being ing subjected to intense heat two or three times. After each heating the milk is kept fairly warm for several hours in order to cause the spores which have not been destroyed by the heat to develop bacteria. The subsequent heating destroys these germs. Sterilized milk will keep for practically indefinite periods so long as the bottles containing the milk are kept hermetically sealed. When once air is admitted the milk soon turns bad unless it is used up.

Failure to Breed.

Sometimes due to over-fatness or some other out-of-condition cause. But if due to a diseased condition within try this simple remedy: Take an ordinary fresh yeast cake and with a little water mix to a paste. Let it stand in moderately warm place for 12 hours. Put this in a pint of freshly boiled lukewarm water and stir, let stand about 12 hours longer and it is ready for use. Inject the whole solution into the vagina when heat is first noticed and breed just as period is about over.

The Homogeniser.

This, as used in the dairy, is an appliance for splitting up the fat globules of milk into a very finely divided state. After milk has been homogenised the cream will not rise, which is, of course, an advantage where milk is to be sold, and is not required for butter-making. When untreated milk for sale is not kept well stirred, the cream will rise, and then any milk taken from the top of the churn will contain cream, thus leaving the remainder of the milk devoid of its due proportion of fat.

A Breeding Record.

This does not come from America, the country of "tall" stories, but from Ireland and County Kildare. A hornless cow, locally called a "muihl" has produced eight calves in three years, or, to be exact, a little more than 37 months. The details are as follows:—October 26, 1909, twin bulls; November 15, 1910, twins, bull and heifer; November 17, 1911, twin heifers; December 5, 1912, twin bulls. The owner of this prolific animal is anxious to know if there is any record of a performance beating this.—Farm and Home, England.

The Maritime Farmer will send to any address, for 40 cents, post paid, one of its useful stallion record books. Each book contains 100 forms for recording full description of mares, 100 receipt forms and 100 blank notes of hand. It is a perfect system of keeping an accurate record of all transactions during the season. Every groom should have one. It provides him with a complete bookkeeping outfit and the books fit comfortably into an inside pocket.

The Dairy Cow as a Soil Builder.

The dairy cow not only furnishes a means by which ready money can be made from the sale of her products, but furnishes a very valuable means of helping to solve the more important question of soil fertility.

A cow produces 14 tons of solid and liquid manure yearly, a ton of which contains 8.6 pounds of nitrogen, 5.8 pounds of phosphoric acid and 8.8 pounds of potash, which at 20 cents per pound for nitrogen and five cents each for phosphoric acid and potash is worth $240 for plant food.

It is true that all this manure is not saved, but consider that wheat or oat straw contains 9.6 pounds of nitrogen, 4.4 pounds of phosphoric acid, 16.4 pounds of potash, per ton, and on the above prices for these ingredients are worth $296, and forest leaves contain 15 pounds of nitrogen, 3.2 pounds of phosphoric acid, and 6 pounds of potash per ton, and are worth $346. Say one-half the value is preserved and a liberal quantity of either straw or leaves is added as bedding for the cows, the loss by not being able to save all will most certainly be made up. Think what this amount of manure per cow means to poor land.

The dairy cow is indeed a valuable soil builder.

How Many Eggs a Year?

It is impossible to answer anything about how many eggs a hen of any variety or breeding will lay. The various breeds have different characteristics of egg laying, but still more striking is the difference in the number of eggs laid by special strains of fowls, even of the same breed and variety. Yet more remarkable are the performances of different hens of the same strains, even when these are kept under identical conditions.

It is no unusual thing for individual hens in a flock to have records ranging from no eggs at all to more than 200 eggs a year. When an egg yield is below six dozen annually it may be considered a poor one. Ordinary egg yields run from six to 10 dozen eggs to the hen a year. When a flock ranges between 120 and 150 it may be said to be yielding remarkably well. Flock averages above 150 may be said to be extraordinary.

Unfavorable weather or even season may effect an egg yield temporarily, but fowls will usually pick up and make a good average. It must be seen that to answer the question as it stands is impossible, but by giving the above facts, the importance of having fowls not only of good variety but also of good strain is a more important factor than mere breed or variety, because there are strains in all varieties that compare favorably in egg laying with one another.

This statement applies not only to the various varieties of one class, such as the American, but to the various varieties in other classes. That is to say, there are strains of Plymouth Rock fowls, which breed belongs to the American class, and strains of Brahma and Cochin breeds, which belong to the Asiatic class, that compare favorably with even the best strains of Minorca and Leghorn breeds, which belong to the Mediterranean, the most noted egg laying class. It must be remembered, however, that extraordinary egg yield may not be most profitable to secure, and for this reason the farm flock that averages more than 10 dozen eggs annually is doing really very superior work—better work probably from the standpoint of profit than many of the egg specialists' flocks do, particularly if these eggs are secured when prices are high.

Curing a Forger.

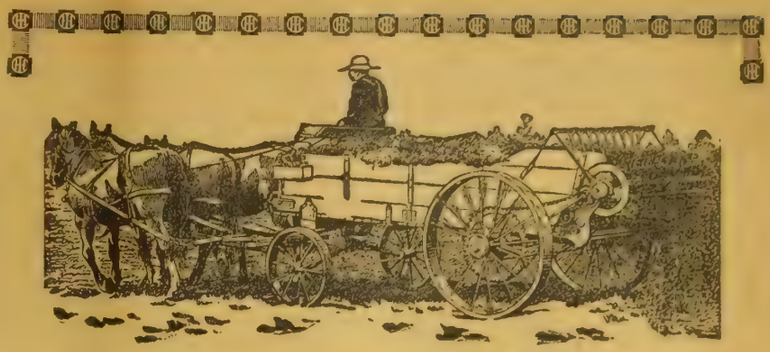
J. B. M., Kings Co., P. E. I.— A coming three-year-old colt, of good conformation and a smooth traveller, forges sometimes when ridden or driven. He has never been shod, as I fear he may injure himself with his hind shoes. How can this fault be remedied? I want to use him as an all-around family horse.

Ans.—The forward action of the colt must be quickened and the hind action shortened. To accomplish this, shoe with good weight in front with either a square or roll toe to the shoe. Generally a square toe of about 2½ inches is most effective. Dress the front feet to a high-heeled and short-toe fashion, allowing the horn to project beyond the square toe. Behind have a low heel and long toe, with shoe flush with the toe. Make the shoe long, extending back to the heel, with rather high heel calks and no toe calk. Most of the weight of the front shoe should be in the toe, thereby extending the action and and helping in that way. If the roads require calks for front shoes, braze them on lengthwise at the heel, using two screw calks at the toe.

Usually this method will solve the difficulty, but not always. An expert smith riding behind the colt, or watching his action from the ground, is the most likely to solve the problem. A couple of deep grooves across the square or rolled toe are often of appreciable aid by furnishing a grab without slowing the break over. Occasionally the high-front heel is a detriment, but not often.

The Lay of the Hen.

Possibly no part of the farm has been so neglected in the past as has the poultry crop. A bunch of chickens have always been considered as part of the necessary adjunct of any farm, simply because everybody had a few hens picking up grain about the barns and graneries and breaking down the binder reels and painting the seats of the sufky plow with manure, which elicited much grumbling from the farm hands. Ma and the girls took care of the hens, gathering the eggs and sitting the hens every spring. They liked to fool around with a bunch of hens and a lot of little chickens all summer, complaining when the rats and the civit cats got the major portion of the bunch, and bewailing their luck when a freshet drowned fifty or so, but stubbornly sticking to raising chickens because they could get a little pin money for parlor furniture, rugs, silk dresses, etc., after the grocery bills had been traded out in eggs, and the boys had all been supplied with overalls and work shirts. Such was the hen which we first knew. She carried the house expenses along without anyone paying any particular attention to her the fact that she did this being merely a common occurrence which drew no particular attention to her homely appearance. If the crops failed, the hens kept the table up to the mark without making a draft on the bank account. But that was expected of the patient and long-suffering hen. Of recent years, however, the hen is getting her just recognition, even on the farm. No longer do the women bother with the common, or garden-scratching variety of hen. They must have imported strains of Rose Comb Rhode Island Reds, Barred Rocks with pedigrees for every egg, or any other breeds they may prefer, but insisting on birds with reputations for doing things, and doing them oftener and at more opportune times than the birds they had last year. The hen is no longer given a squatter's claim to the old buggy top, the binder seat or the stable. She has a house of her own, and it is kept sweet and clean. When she lays an egg it is an event that becomes history. If she doesn't lay one and repeats this omission often enough, she becomes pie. She must be useful as well as ornamental. There is no sentiment for the hen even now, unless it is the kind that begins at home. The hen has become a machine for turning out eggs and meat. The more she turns out, the more welcome she is. Science has been put into the hands of the breeder to build a hen that will do these things in the way they are wished. Through generations of clucking biddys this tool is fashioning the homely old hen into a money maker that ranks in return second to none. Cultivate the hen. She will return you a wonderful crop. Her cackle will become music to your ears, especially on days when the thermometer registers 40 degrees below zero and the market registers 60 cents per dozen.



What Three Bushels More to the Acre Means

EIGHT years ago the farmers in a central state raised average crops that ran three bushels less to the acre than they now get. Suppose each acre of farm land in this country were so tended that it produced an equal increase. How much more money would farmers have, with which to buy the luxuries of life that they earn and deserve?

What others have done, you can do. Your share in this prosperity depends entirely upon yourself. The first step for you to take is to fertilize your land properly with manure spread by an

I H C Manure Spreader Corn King or Cloverleaf

Manure cannot be spread as it should be unless a machine is used. An I H C spreader covers the ground with an even coat, light or heavy as may be needed, and pulverized so that the plant food elements in the manure combine with the soil to best advantage.

The spreader that does this work as it should be done must have many excellent mechanical features. The apron should move without jerking; the beater should meet the load at exactly the right point to pulverize the manure without too greatly increasing the draft of the machine; the speed changes of the apron should be positive whether the spreader is going uphill or down, otherwise the spreading will be uneven. All these features are provided for in the construction of I H C spreaders.

The I H C local agent carries in stock the machines best suited to your locality. See him for catalogues and full information, or, write the nearest branch house.

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking,

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally;

E. M. MORRIS, Manager 1900 Washer Co'p'y.

357 Yonge Street, Toronto, Can.

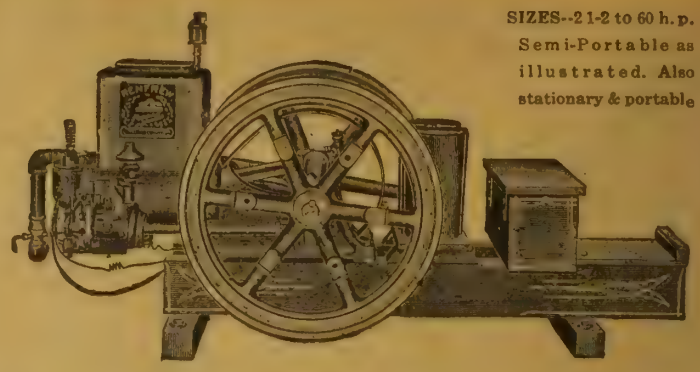
Keeping Any Bovine Boarders?

In the midst of our "cow preaching" we pause occasionally to insist on farmers knowing something of their cows. There are cows and cows, you understand, and there are loafer cows as well as loafer men, loafer grains of wheat, vagabond fruit trees and boarder hens. As Prof. Holden, of two-grains-of-corn fame, expresses it, "A stalk of corn that has been loafing around all summer doing nothing." It is all very well to have cows and live stock of other kinds—it's the proper thing in farming. But remember to have cows, hogs, chickens, or whatever kind of live stock you raise, that aren't loafing around all year doing nothing but board with you. Have only the kind that pay you handsomely for their board. With all this agitation for more live stock in the West, especially dairy cows, there have been hundreds of "boarder" animals brought in and sold as heavy producers to farmers who know no better. They are reaping the consequences now, simply because they do not understand how to weed out the "boarders." The Babcock test for butter fat in milk and the common spring balance make it possible for any person to know what cows are "boarding" with him and he can eliminate them from his herd and grade up his herd until good cows will be producing double, triple or even quadruple what the average herd of grade cows give. It is dollars and cents to the owner. If one cow can be made to do the work that three have been doing and do it on one-third the feed and take but one-third the stable room and one-third the milker's time, it is worth investigating. A man spends something like four days sitting under a cow in the course of a year. If he likes his job well enough to spend a week or even twelve days under three cows instead of one, well and good. Our message is not for that man. We want to talk to the man who milks for results. He is the man who gets the most milk from the least number of cows on the least stable room and feed possible. This does not mean that he starves his cows. He feeds them heavily and experiments with the Babcock test to ascertain the amount that will bring the most butter fat. He uses the scales every night and morning for weighing the milkings and the Babcock test at least once a month to get the fat content. At the end of the year he has an account that shows whether or not each and every cow in his herd has been boarding with him or working for him. His checks from the creamery also shows that it has paid. If you are the man, write and tell us about it. If you are not read and learn how from the experiences of those who are.

Poultry Notes

A fowl should always be fattened as quickly as possible. Ten days is long enough, but it should be confined either in a coop or a number in a small yard. They must have a continual supply of fresh water, and should be fed four times a day, the first meal being given early, and the last one late.

The poultryman who follows the daily cleaning method is generally the one who looks after the other essentials, considering them equally as important. Cleanliness should be more rigidly enforced in winter than account of much bad weather, and in summer, for the reason that on longer nights, the fowls are compelled to spend more time in the houses.



SIZES--2 1-2 to 60 h.p. Semi-Portable as illustrated. Also stationary & portable

Tested With Boiling Water

Every Renfrew Standard gasoline engine is thoroughly tested before shipment. It must show at least 10 p. c. more horse power than it is rated, by an actual brake test, with boiling water in the hopper. This test also proves the soundness of the workmanship. Every

Renfrew-Standard

engine is also tested for balance. It must be so perfectly balanced that it will run with clock-like precision and smoothness. It must start easily without cranking. In short, the engine must be absolutely right in every particular before our inspectors affix their O. K's. If you were at the factory, you might think we were over-particular. But just think what our painstaking and care means to the purchaser of a Renfrew-Standard engine. It assures him getting an engine whose reliability has been proven under test—one that will give him great satisfaction.

Write for our engine catalog. It describes the Renfrew-Standard in detail, and contains information about gasoline engines that every progressive farmer would like to know.

ORNAMENTAL WIRE FENCE

8¢ PER RUNNING FOOT FREIGHT PREPAID

We want you to investigate this statement—we make a better ornamental wire fence than can be purchased elsewhere for double the money. We guarantee absolutely every foot of fencing we manufacture; satisfaction or money back and we pay the freight. We are manufacturers of the REGAL Extra Heavy Galvanized Ornamental Wire Fence, and we sell miles and miles of it all over Canada for enclosing lawns, parks, cemeteries, churches, cottages, farm houses, mansions, schools, etc., etc.

For the City Residence

For the Country Home

Regal

Remember, we are largest buyers on wire market; our is 20 per cent of any other manufacturer. We employ no agents nor jobbers, but sell direct to the consumer for cash, saving you the dealer's commission, and heavy expenses incident to a credit business. We have just published a catalogue. It tells of the greatest fence offer ever made. You owe it to yourself to read this great REGAL offer. Use the blank form herewith and mail to us today and we will forward to you our special offer at once.

one of the the Canadian buying price lower than that

WE GUARANTEE Every foot of Regal Fence to be in every way satisfactory in appearance and quality. If your purchase is not satisfactory we return to you your money without question and get your fence back at our expense and get your money without question and get your money without question. We guarantee the Regal to be made from the finest brand new fencing wire; that every strand is the full gauge specified; that every strand of wire is of our own manufacture; that every strand is heavily galvanized; that the Regal fence has been submitted to and passed chemical test, thereby proving that it will outlast and outwear any other fence on the market. This guarantee is positive and absolute. The Regal Fence Co., Ltd., Sarnia, Ont.

FLORICULTURE.

Moncton Correspondent:—Bulbs received are undoubtedly off-shots of the Chinese Sacred Lily and should hardly be expected to bloom. Possibly, if grown out of doors next summer, in the ground, they might come to bloom next winter, but that is very problematic. Better buy full-sized bulbs another time. There is nothing saved by buying cheap stock.

Oralia, St. Stephen, N. B., writes:—I have a plant of Oralia, that bloomed finely last Easter. I grew it out of doors as directed by you and it did finely, being covered with little budded tips when it was brought in this fall, but now the leaves are turning brown and dropping off. They have a sort of rusted appearance on the under side. What should I do to save it?

The Oralia is probably infested with red spider or thrip, possibly both. These can be conquered by spraying with cold water applied forcibly to the under side of the leaves. In the event of there being thrip present, it would also be advisable to use tobacco water as a wash once a week. Do not use the tobacco water if the buds are showing color or it will spoil the flowers.

A flower lover, of Woodstock, N. B. writes:—Is there a plant called the Resurrection plant? If so what does it look like? Is it a desirable plant for the house.

There is a small desert plant, that when dry, somewhat resembles the liverwort that grows so commonly on maple bark. It is thoroughly dormant when sold but on being immersed in water it gradually opens out becoming quite green and presenting a quaint rather than pretty appearance. It gives off an odor which has been compared with that of a newly scrubbed floor, when plenty of hard soap is used. I would not consider it a valuable plant, it is a curiosity.

H. A., St. John, N. B., writes:—I have a palm that is beginning to turn a little brown at the tips of the leaves. It is quite a large plant and is kept in a jardiniere, but it is so heavy that it is seldom taken out except when the pot is washed. I have been advised to water it with coffee grounds. Would that hurt it?

I would fancy that your palm needed a little air around the pot or that the drainage is in some way deficient. You had better examine the drainage carefully. You wash the pot well and clean the inside of the jardiniere. I fail to see what benefit the coffee grounds would be in any case and certainly if the drainage should be bad any further application of foreign matter would only aggravate matters. I am quite aware that people who are successful with palms use such remedies but have never seen a case where any real benefit could be directly traced to either use. However, there may be such and to a healthy plant, they could not be injurious.

Few people are aware of the value of soot. It is generally regarded as a waste article. Save carefully all you can obtain from chimneys and stove pipes and keep it dry for use in your garden next spring. It is not only a powerful fertilizer but is also a very valuable insecticide. When mixed with the soil dry or applied to the surface in liquid form it will destroy all forms of insect life, either the eggs, larvae or perfect form.

Many old rich gardens that have been used for years are infested with small white grubs that feed on the roots and crowns of plants. They are especially fond of pansies, rendering it almost impossible to cultivate them. Soot is the only remedy for this grub. When you dig up your beds in the spring apply a coating of half an inch to the top of the soil; Mix it in well, then after your plants are established apply once a week about a handful of the soot mixed in a gallon of water and you will find the grub very quiet. Not only this, but you will find that your plants make an extra, vigorous growth due to the nitrogen carrying ammonia the soot contains.

As soon as the ground freezes about two inches deep apply about six inches of coarse strong manure. over your bulb beds. Never do this until the surface is frozen as the heating of this mulch would induce top growth of the bulbs which would enfeeble them at this time of year.

If you want a running vine for a room decoration in winter, that will only give you the trouble of watering use an Ivy. The old English is good for that purpose as it will stand extremes of temperature and light. As I write, over my desk, in a dark corner of the room, is an English Ivy, some ten feet long, well branched, that has been in that position for several months, growing as strongly and as healthy as it did in the green house. Of course, more light would be better for it, but a portion of it trained over the ceiling is as strong growing and with as good foliage as it is where more light strikes it.

Be sparing with fertilizers until March unless plants are very much root bound and cannot be repotted conveniently. Most decorative plants make little growth during the cold months even in well heated houses and, therefore, do not require as much food. If any one experiences difficulty in getting a fern to grow well in small dishes try that pretty, little, compact, hardy fern, aspidium psusimense, it is most satisfactory for those small silver pans.

W. P., Victoria Co., N. B., writes:—Will you please tell me what is wrong with our house plants. They are ail dying down and on looking at the roots we find them all covered with small, white worms that look like jelly. We have tried all kinds of earth but they come just the same. Please let us know what we can do through your paper.

Ans. Please mail sample of insects on roots of plants, we cannot identify without same.

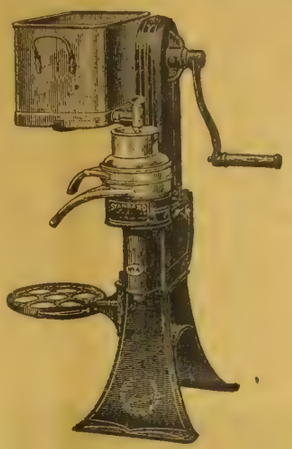
For These Reasons



FREE

Write for the Standard Booklet, giving a full description of "The World's Greatest Separator," also folder entitled "Skimming Results."

TO tell all the reasons why we believe your choice of a cream separator should be the Standard would be impossible in this space, but here are four. **FIRST**--Because the

Standard

cream separator under ordinary conditions skims to .01 per cent. or less. It loses but one-tenth of a pound of butter fat in 1000 pounds of milk skimmed. The ordinary separator loses a full pound. **SECOND**--Because the Standard has a widc open bowl, and no cream or milk tubes to clog up. Everything easy to clean. **THIRD**--Because the supply can is more than a foot lower than on ordinary machines. No high or awkward lifting to do with the Staudard. **FOURTH**--Because the Standard has a self-oiling system and lubricates its working parts automatically all the time it is running.

The Standard will save more time and labor, and make more money for you, than any other cream separator. Try one and let the machine prove these facts.

GRAIN—Wheat, 90c. to $1.00; Oats White 38c., Black 40.

FEEDSTUFFS—Bran, $1.30 to $1.40 Shorts, $1.45 to $1.55; Middlings, $1.50 to $1.60; Oil-Cake, $2.10 to $2.25; Cottonseed Meal, $2.00; Gluten Meal, 1.80 to $1.85; Corn Meal, $1.90.

LIVE STOCK—Butcher's Cattle, 5c. to 6c. per lb; Stockers, $18.00 to $35; Milch Cows, $25 to $40; Sheep 4c. per lb.

DRESSED MEATS—Beef (carcass), ordinary quality 7c. to 8c.;Beef (retail) 9c. to 14c.; Mutton (carcass) 9c. to 10c.; Veal 5c.;Pork, 11 to 11½c.

HORSES—Drafters, $150 to $200.00 Roadsters, $150 to $250.00; Carriage, $150 to $250.00.

DAIRY PRODUCTS—Creamery Butter, 28c. to 29c.; Dairy Butter, 24c. to 26c.; Cheese, 14c. to 14½c.

POULTRY AND POULTRY PRODUCTS—Eggs, 18c. Fresh; Fowl, 10c. to 14c.; Chickens, 12c. to 15c.

FRUIT—Apples, $2.50 to $4.00 bbl.

MISCELLANEOUS—Hay, $10.00 to $12.00 per ton; Straw, $5.00 to $6.00 per ton; Wool 24c. per lb.; Beef Hides, 10c.; Calf Skins, 14c.; Lamb Skins, 70c. to 80c.

VEGETABLES—Carrots, 50c. per bush.; Potatoes, 25c. to 30c. per bush; Turnips, 18c. per bush.

Owing to storms the market during the past few days has been very poorly supplied and it is difficult to quote on many lines, in fact, prices quoted in several cases are only nominal, no transactions having taken place. For instance, there has been no vegetables on this market for some time. Butter is dull, demand poor. Eggs are in fair demand for fresh receipts but held eggs are almost unsellable. Pork and beef are both in good demand and prices firm; but supply of former very limited, prices are being advanced daily. Poultry is scarce, fowls being about the only thing offered. Hay is fairly plentiful, but demand is limited. Oats are dull and farmers are not pushing sales. Feeds of all kinds are lower and in only limited demand. Trade in general is quiet.

Halifax Prices.

GRAIN—Oats, 53c. to 54c. bag; Peas, split, $8.00 bbl., Rd. $7.00 bbl.; Barley, Seed, $1.60 bag, 100 lbs.

FEEDSTUFFS—Bran, $24.00 to $24.50; Shorts, $24.50 to $25.50; Middlings, $25.50 to $27.00; Oil-Cake, $2.15 to $2.25 100 lbs.; Linseed Meal, $2.15 to $2.25 100 lbs.; Cottonseed Meal $1.85 to $1.90 bag; Gluten Feed, $1.50 to $1f5 bag; Corn Meal, $1.45 to $1.47½ bag.

LIVE STOCK—Milch Cows, $40.00 to $50.00.

DRESSED MEATS—Beef (carcass) 8c. to 10½c.; Beef, (retail), 16c. to 24c.; Mutton, 13c. to 15c.; Veal, 52c. to 14c.; Pork, 13c. to 16c.

HORSES—Drafters, $250.00 to $300. Roadsters, $200.00 to $250.00; Carriage, $200.00 to $250.00.

DAIRY PRODUCTS—Creamery Butter, 30c. to 32c.; Dairy Butter, 25c. to 26c.; Cheese, 15c. to 15½c.

POULTRY AND POULTRY PRODUCTS—Eggs, 26c. to 30c.; Fowl, 14c to 15c.; Chickens, 16c. to 17c.; Ducks, 17c. to 19c.; Geese, 15c. to 17c. Turkeys, 20c. to 21c.

FRUIT—Apples, $1.50 to $3.25 bbl.

MISCELLANEOUS—Hay, $14.00 to $16.00 ton; Straw, $9.00 to $9.50 ton; Beef Hides, 11c. to 13c. lb.; Calf Skins, 12c. to 16c. lb.; Sheep Skins, 85c. to 90c.; Lamb Skins, 75c. to 85c.

VEGETABLES—Carrots, $2.00 bag of 3 bus.; Potatoes, $1.60 to $1.75 bag of 3bus.; Turnips, $1.00 to $1.10 3bus. bag; Beets, $1.75 3 bus. bag; Parsnips, $1.75 to $2.00 3 bus. bags; Cabbage, $1.75 to $1.80 bbl.

Cucumbers Under Glass.

A good many greenhouse men devote a part or all of their houses to cucumbers instead of tomatoes in spring and early summer. Cucumbers are a more uncertain crop than tomatoes. They are hard?r to grow as the vines are very tender, and the prices fluctuate more than the prices of tomatoes. When a maximum crop of cucumbers is secured and prices are high, that is 40 or 50 cents a dozen, the income from a given area voted to tomatoes. When the cucumis greater than an equal area than deber crop is poor or the price low, 20 or 25 cents a dozen, the profit from cucumbers is less than from tomatoes. The income from cucumbers, if considered for a period of years, will be about the same as that from tomatoes.

Cucumbers grow to maturity much sooner than tomatoes. This is one of the reasons why they are grown more commonly under glass. They are usually started in 3 or 4-inch pots, the seeds being sown three or four in a pot and about four weeks before the plants are to be set in the permanent beds. After the plants have started nicely they are thinned to two in a pot.

Some growers set the plants in rows several feet apart and from 12 to 15 inches in the rows, one plant in a place. When grown these distances apart the vines are trained on an inverted V-shaped trellis made of wire with wooden supports. Other growers set the plants 2 by 2 or by 3 feet, in which case the vines are trained to strings or laths which are strung or set upright, the upper ends being attached to wire run directly over and parallel with the rows. The vines attach themselves to the string if twisted around them. When laths are used, a rail fastener is employed to support the vines. Bees are placed in the houses to pollinate the blossoms; thus hand pollinating is not necessary in the case of cucumbers. The lateral vines on cucumbers are all cut off just beyond the first female blossom. This practice is followed, no matter what the method of training.

Echoes From the 1912 Ayrshire Breeders' Association.

Following are the Ayrshire judges selected at the recent annual meeting of the Canadian Ayrshire Breeders' Association, to officiate at Maritime Shows in the Autumn of 1913.

Halifax—D. Drummond, Ottawa; Wm. Stewart, Menie, Ont., reserve.

Chatham—Wm. Stewart; D. Drummond, reserve.

Fredericton—John McKee, Norwich, Ont.; Hector Gordon, Howich, Que., reserve.

Charlottetown—John McKee; Wm. Stewart, reserve.

Victoria, B. C. and Red Deer, Alta. —G. C. P. McIntyre, Sussex, N. B., Robert Robertson, Nappan, N. S., reserve.

AYRSHIRE ASSOCIATION EXHIBITS GRANTS.

Fredericton, $50.00; Charlottetown, $50.00; Halifax, $50.00; Chatham, $25.

Delegates Attending the First New Brunswick Women's Institute, Fredericton, February 18th and 19th, 1913.

Report of meetings will be given in a future issue of the Maritime Farmer.

00. The above amounts in each case to be given to four the get of one sire, to be bred and owned by exhibitors. Two animals, the progeny of one cow, to be bred and owned by exhibitor.

Maritime Winter Fair dairy test, $200.00.

DELEGATES TO FAIR BOARDS.

Fredericton—G. C. P. McIntyre, Sussex, N. B.

Halifax—John Retson, Truro, N. S.

Charlottetown—Jas. Easton, Charlottetown, P. E. I.

Chatham—Geo. E. Fisher, Chatham N. B.

Black, Amherst, N. S.

Maritime Winter Fair, Fred S.

OFFICERS.

President—Wm. Stewart, Merrie, Ont.

Vice.President—G. C. P. McIntyre, Sussex, N. B. Mr. McIntyre is the only Maritime man on the boald of directors.

Secretary—W. F. Sleptren, Huntingdon, Que.

Poultry and the Orchard.

For my flock of 1000 hens I have a 30-acre orchard for range. I keep the hens in colony houses built in a row through the centre of the orchard. There are 50 hens to a house. I have found that growing poultry between the trees in the orchard is not only a good way of taking care of the poultry themselves, but it helps to enrich the soil for fruit trees It also brings in a consant revenue while the trees are preparing to bear.

I supply the fowls feeds that I know contain enough protein for egg laying and let them do the balancing themselves. For feeding and finishing broilers I feed corn meal, moistened with milk. The regular rations are wheat, oats, dry mash and beef scraps. I sell nothing but strictly fresh eggs, as they bring the highest prices. I also sell eggs for hatching. The poultry business is certainly profitable, or can be made so by any man willing to work and study the nature of fowls. It is a business, however, that no man can engage in half-heartedly and win.— N. C. Jorgensen.

Cause of Soft Pork.

A great deal of soft pork may be seen on the market and in farm smoke houses. The kind of feeding was the cause of this, and it could have been prevented by a proper use of proper food materials.

The exclusive use of corn for hogs, especially through the growing period, produces excessive fat and makes soft pork. Cowpeas, soy beans and peanuts make even a softer and oilier meat than does corn. All of these are excellent foods for hogs, but should form only a part of the ration and should be reduced at the close of the fattening period.

Barley is one of the very best feeds for making high-class pork. It is used extensively by the Danes, who have an international reputation as producers of pork. Oats also rank high, but the price in this country is usually prohibitive, except for breeding stock. Skim milk and butter milk fed in combination with grains make ideal hog feed.

Planting Trees.

How many attempts at planting shade or ornamental trees have been failures in whole or in part, and how many times is the tree planter at a loss to understand the cause of his failure? The following discussion by Dr. B. A. Fernow, Dean of the Faculty of Forestry, University of Toronto, will throw much light on this problem, and should assist many who will plant trees next spring or fall:

The first cause of trouble and of death in transplanted trees is not unfrequently to be found in the ignorance and lack of care exhibited before and during transplanting. Many trees set out are dead or are doomed to death before they reach the plant hole. Transplanting a tree from one side to another is a surgical operation during which the patient needs special attention.

FEEDING SYSTEM IMPAIRED.

It is rarely, if at all possible to take up all tne fine rootlets with their root-hairs intact; these adhere closely to the soil particles, hence, in the attempt to remove them, a portion of the feeding apparatus is always mechanically destroyed. Next, the delicate root-hairs, and fibrils are not apt to dry out when exposed to the air, especially in windy, sunny, dry weather, and thus another portion of the feeding apparatus is lost. Lastly, with larger specimens, the far-lying roots can practically not be reached and a third portion of the root system is cut off. Furthermore, if the plant material is shipped any distance, the vital activities are interrupted, temperature and moisture conditions may be unfavorable during transhipment, and a partial drying out of roots, buds or foliage is the consequence.

As a result of these losses, the balance between crown and root, between consumption and supply of water is disturbed, and unless this balance is at once re-establ shed by pruning at the top and by favorable conditions for replacement of lost parts of the root, a part of the crown must die.

HOW TO TRANSPLAET TREES.

This trouble may be nearly or entirely avoided by transplanting with a ball of earth, when the root system is not at all disturbed. This is usually practicable only with small trees; as a rule transplanting is done with the naked roots. Care should then be had to take up as much as practicable of the root system, keeping it intact, using a fork rather than a spade, and keeping in mind that the root tips are the important part, then the roots should be immediately protected against drying out by covering with moist soil, wet bagging, moss, etc., and be kept moist until the tree is reset.

If it has not been possible to secure the entire root system practically intact, then a proportionate amount of the crown system should also be removed by cutting back branches, using at the same time the opportunity for correcting the farm. This pruning is best done before setting the tree, or, more conveniently, at once after setting while the knowledge of the conditions of the root system is still fresh in mind. If it is neglected parts of the crown will die, and these may not be the parts we are willing to spare. It does not matter much if the pruning at the top is more severe than necessary; sparing the knife unduly matters much more.

Nursery stock, when received, should be opened at once in a shady cool place and the root packing examined. If it is dry and hot, the chance of securing a living plant is small. Nevertheless, by proper treatment, plants may sometimes be resubmerged under water may restore will stand a good deal of maltreatment and are able to recover. "Heeling" them in deeply in a trench under shade and in fresh soil, and drenching them thoroughly with water, keeping them drenched for a day or two, or even keeping them entirely submerged und?r water may restore what appeared quite hopeless material. Even if the leaves of contifers have suffered, so long as the buds are still fresh looking, the case is not quite hopeless provided proper care is applied in keeping roots and tips moistl and, especially, if rainy weather sets in.—C. L.

Ophthalemia.

G. B. D.—My sheep have been troubled this winter with sore eyes. The eyes first begin to be watery and then turn red and then white, and look as if they were frozen. Some of the sheep get blind, but all have recovered from it. Would you please answer through the columns of "The Maritime Farmer" what this trouble is, and if it is contagious as it seemed to go through the whole flock. I bought an imported buck last fall, and I thought perhaps that was where they got it, although he did not have the disease.

Ans.—The disease is Ophthalmia or inflammation of the mucous membrane lining the eye lids and covering the eye and finally including the structure of the eye-ball. It is supposed by some practitioners to be contagious, but doubted by others. Generally a whole flock will be affected but they are sdbjected to the same cause, whether it be food or some other cause. It is most prevalent in the fall of the year after a wet season and on pastures where there is stagnant water or swampy ground. It is not often found on high, dry pastures.

Treatment: Remove the animals to shaded, high, dry pastures if attack is during grazing season. If after housing, place in well-ventilated clean pens and do not over crowd. Feed light food, such as well cured hay and some roots—turnips, carrots or mangels— and bathe the eyes once daily with warm water, afterwards applying around and in the eye, a small quantity of an eye lotion made by mixing four drams of Sulphate Zinc; four drams of Laudanum, and one pint of water, or one ounce of Boracic Acid dissolved in one pint of water. I prefer the Zinc and Laudanum solution. With care nearly all cases recover. The animals in pasture require the same attention to the eyes as when housed.—J. Standish, V. S.

Cheaper Chemicals for N. B. Farmers.

Quite a lengthy discussion followed the introduction of the resolution introduced by A. C. Fawcett before the recent N. B. F. & D. A. at Fredericton, in which the Government was asked to take steps to procure for the farmers of the Province, at first cost, the necessary chemicals for the home mixing of fertilizers.

Mr. Fawcett had a good grasp of the situation and showed how farmers were unwittingly paying exhorbitant prices for fertilizing elements, which were frequently obtained from sources which were not immediately avaifable for plant food. To obviate this he pointed out that the home mixing of fertilizers was the only solution.

The propaganda inaugurated some years by the German Kali Works has to a large extent been responsible for awakened thought in the direction of cutting down fertilizer bills.

Mr. Fawcett also stated prices quoted by the Cross Fertilizer Co., of Sydney. Their basic slag delivered at Sackville for $11.00 was considered to be a fairly reasonable figure.

Messrs. Ashley George, Upper Sackville and R. G. Murray, St. John, followed Mr. Fawcett in favor of the argument and when the question was brought down for the final vote, there was not a dissenting voice.

About the Farm.

Don't be a "near knocker." Be a booster. Every one knows what a booster is.

If nuts work loose in machinery bolts try daubing the bolt threads with varnish.

You can't run away from little difficulties. You must fight them or go under. So when you meet them don't back up but get them out of the very

The elevator to success is generally crowded. Better try the stairs.

When raking the lawn with the iron rake try putting a piece of cob on each two outside teeth of rake to regulate depth.

It will pay the landlord nine times out of ten to purchase a good manure spreader for his tenant. In many cases, where a long time lease is in vogue, it will prove profitable for a tenant to get a manure spreader. Why would it not be a good plan for the two parties to the contract to divide the expense?

The broad-tired, low wagon on the farm comes in handy in hauling stones, earth and stumps, as well as hauling implements back and forth on the farm, seeds in sacks, potatoes in sacks, barrels of apples, lumber, poles, wood, fence posts and wire husked or snapped corn, corn fodder, etc. There is no limit to its use. It is convenient and saves much labor on the farm. Aside from it being a labor saving device, it assists in road making instead of road rutting.

Sanitary Remodeling of Dairy Barns.

(Continu?d from page 341)

It is difficult to induce dairymen to discard or change the unsanitary plank flooring that is commonly found. Rotted by continual soaking from liquid manure, and often having cracks which allow bad odors to rise, these floors are not conducive to sanitary milk production.

Wooden floors must be constructed carefully in order to be satisfactory and a good absorbent must be used.

Under most conditions concrete is the best material for flooring, and it is certainly the most durable and the most sanitary in the long run, and therefore the most economical. Many mistakes have been made in dairy barns and in creameries by improper mixture of sand, cement and gravel,

Fig 8 Cement Manger.

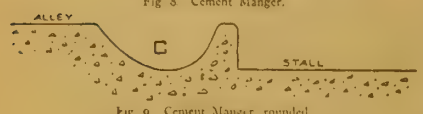

Fig 9 Cement Manger, rounded

Floor and Gutter.

and in improperly prepared foundation and slant for the floor. A fairly rich mixture makes the best cement floor, one part cement and two of sand for a top dressing. To make a good Grout or body, 1 part Portland cement to 2½ parts screened sand and 5 parts gravel or crushed rock, should be the proportion of mixture. While doing concrete work in hot weather, the pile of crushed rock should be thoroughly wet.

The floor must be graded or sloped, so that water will not collect on it and so that manure washings may be caught and run by means of gutters made in the floor.

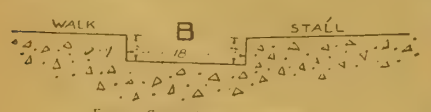

Fig 10 Cement Gutter, for common use

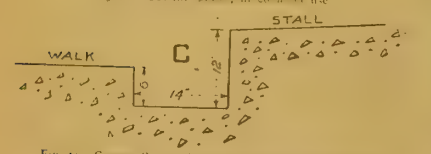

Fig 11 Cement Gutter, for large animals in common use.

Gutters behind the cows vary in depth from 4 inches to 12 inches, and in width from 14 inches to 18 inches. The gutter should allow the droppings to gather below and back of the animals when reclining. Often a movable crossbar is used, on the rear floor, to keep the animal ahead in the stall when lying down. Iron gratings in the floor for drainage of liquid manure are often found, but frequently teats are pinched in this way. When a good absorbent is used, no gratings are needed.

MANURE DISPOSAL.

Losses in the value of manure occur chiefly in three ways:

1. By escape of the liquid portion through barn floors for want of a proper absorbent.

2. By heating and fermentation due to being heaped for long periods at a time.

3. By leaching and drainage due to exposure to sun, wind and rain.

When a farmer understands that about 75 per cent of the fertilizing elements fed to the cow is left in the manure, he will realize that he can reduce his fertilizer expense and improve the physical condition of his soil by properly caring for and applying that manure.

It has been estimated that manure from ten cows for six months has a fertilizer value of $185.97. This does not include its value for adding humus to the soil, a factor not present in commercial fertilizers.

Under experiments in Maryland it was found that 80 tons of manure cared for in the average manner, lost 53 tons in weight alone in one year. That much nitrogen and other valuable fertilizing material are lost from improper care of manure on our Maine farms is very evident.

The common way of disposing of manure on our average farm is to push it through the barn floor or to pitch it out of an opening back of the animals.

The objection to the through-the-floor method is that it is allowed to accumulate too long, resulting in bad odors rising into the stable due to lack of ventilation beneath. Even with a concrete manure pit beneath the barn, odors rise because of improper ventilation.

If room enough can be made beneath the barn to allow a dump cart to be backed beneath the scuttle hole and when filled hauled to some field or manure pit, there is no doubt but that more sanitary milk and better crops would result. No man relishes the task of removing manure from a stuffy barn cellar in the spring of the year when a small amount removed once or twice a week would be sufficient.

The objections to pitching the manure out back of the cows are that much of its value is lost by leaching and that it becomes unsightly and rots away posts and woodwork. As a breeding place for flies, gnats and cutworms the manure heap is ideal.

The following cut shows a common condition,—lack of light and ventilation, and improper disposal of manure.

Fig. 12. Slack conditions on dairy farm

The farmer of the future must learn the value of caring for the manure. The overhead track litter and manure carriers are being installed in many barns because of their saving labor and comparative cheapness. The track usually conveys the tub to a waiting dump cart or to a manure pit away from the stable where it belongs.

These carriers are within reach of many who have not cared to investigate for fear of high prices but they are worthy of more attention as a means of economy to the busy dairyman.

STABLE YARD.

That the stable yard has a big influence on the production of clean milk is a fact entirely disregarded on many farms. It is not uncommon to find an otherwise sanitary milk farm with a poorly drained yard with perhaps the manure pile as a source of drain.

As the cattle gather here before entering the barn to be milked, it is essential that they be kept out of the mud and filth so that their udders and bellies will not become soiled. The time and labor saved in keeping cows clean and the lack of fine sediment in the milk will be very noticeable with a clean stable yard.

In order for it to be clean, no ma-

An Object of Pity

That part of our nature which we call the emotional is much more highly developed in women than in men. They are more sensitive, more tender, more sympathetic, more pronounced in their likes and dislikes, more susceptible to the extremes of pleasure and pain; and these refined mental qualities, no less than beauty of form and feature, make up the atmosphere of attractiveness and charm which always surrounds true womanliness.

The continued existence of these winning, engaging womanly characteristics depends to a very large extent on the regularity of the womanly functions and the condition of the womanly organs; and when these functions and organs become disordered or diseased the same mental qualities which are the glory of a well woman become the source of suffering and torture almost indescribable. Her cheery hopefulness is changed to a feeling of despondency, almost of despair, and she is haunted with forebodings of worse evils to come. Instead of being entertaining and companionable, she becomes moody and irritable, being unable to keep her mind from dwelling on her troubles. She becomes morbidly sensitive, imagining that she is being slighted or foresaken by her relatives and friends and she has a most humiliating sense of her miserable condition and of her loss of her womanly attributes. If she is religiously inclined she is very liable to be oppressed with doubts and fears in regard to her spiritual condition, or to think that she is eternally lost. In addition to this, she has also to endure the most distressing aches and pains.

What makes the case still more pitiable, especially with married women, is the fact that few men understand or appreciate the extent of their suffering, or the seriousness of the troubles causing it. Many doctors even speak of these disorders as subjects for ridicule, and the poor sufferer often gets a reputation for being a crank or a scold when she more nearly approaches being a martyr.

As these disorders are due to a disordered condition of the womanly organs, it is evident that to effect a cure these organs must be restored to normal condition; or, in other words, the circulation, which has become congested and stagnant in these parts, must be improved so that the waste matter will be expelled, and the nourishment so badly needed be brought to these suffering organs. It is the waste matter, or broken down tissue, which is held in the stagnant blood vessels in these parts, that causes most of the suffering by oppressing the nerves located in these parts.

The remedy known as ORANGE LILY will positively relieve this congestion and restore normal circulation in the disordered organs. It is an applied or local treatment, and acts wholly on these parts. It is absorbed into the blood vessels in these organs, and as it has powerful antiseptic properties, it immediately acts on the waste matter held there, and causes it to be discharged. As this dead matter is discharged the nerves are relieved, the pains and mental troubles become less, and the nerves and blood vessels become stronger. ORANGE LILY thus proves its merit by actual, visible results. It acts as certainly and as positively on all female troubles as anti-toxin does on diphtheria.

Winnipeg, April 28th, 1909.

Dear Mrs. Currah,—I am very grateful to ORANGE LILY for the change it has made in my life. When I commenced its use eight months ago I felt I would be surely insane before the year was ended. The pain I suffered often made me wish for death, and besides I would have such fits of depression and nervous twitching that I would have to scream. I had doctored with three different doctors for over two years, and had also used both the Pierce and Pinkham medicines, but none of them seemed to reach my case. I felt some improvement after the first month's use of ORANGE LILY and have kept gaining ever since. I do not feel that I am entirely cured yet, but I am so much better than I was that I am sure I will soon be entirely well. I sleep well, and feel cheerful and happy, except that I am occasionally somewhat depressed, but these spells are getting fewer and milder. I have also noticeably improved in appearance. Enclosed find $3 for which please send me two boxes of ORANGE LILY and one of Cerate Massage. I might add that the matter which used to be freely discharged, and which looked like a chicken's gizzard, is becoming very scant, and I imagine that the circulation is pretty well restored. Am I not right in this? Your sincere friend, MRS. L. E. A.

Free to all Sufferers

In order to enable every woman suffering from any form of female disorders to test the merits of ORANGE LILY, I will send to everyone who will send me her address, or the address of any suffering friend enough of the remedy for ten days' treatment, absolutely free. As this is worth 35c. it is only because I know that it must give relief that I make this free trial offer. Further, if any woman wishes expert medical advice, and will write me a full description of her case, I will submit same to the staff of the Coonley Medical Institute, Detroit, Mich., and they will write her direct without expense to her. INCLOSE THREE 2-CENT STAMPS and address MRS. FRANCES E. CURRAH, WINDSOR, ONT. 2

For Sale By Leading Druggists Everywhere.

nure should be allowed to accumulate against or near the barn. The yard should be graded to slope gently from the barn and should be covered with gravel or cinders suffiiciently deep to form a hard surface.

The practice of allowing swine to wallow in the dressing beneath or near the stable is detrimental to sanitary milk production. This may be a good way to keep and feed swine but from the numerous cases of hog cholera there is occasion for a big doubt. However, these conditions are adverse to sanitary milk as odors from a swine pen nearer than two hundred feet to a dairy room where milk is exposed are undesirable.

In some cases where reconstruction is planned the keeping of horses in a different room from the cow stable should be considered, as stable air for cows is contaminated by the presence of other animals. The practice of using horse dressing as an absorbent for liquid cow manure is very unsanitary, yet some dairymen seek to produce clean untainted milk under these conditions. It would seem as if they were endeavoring to abolish one evil by introducing another, and when the first is a problem in itself, why introduce the second? Horse manure may be a good economical absorbent but it has no place in a dairy barn where milk is being drawn and should be substituted at once with plenty of dry sawdust, shavings, leaves or straw.

CONCLUSION.

The problem of securing clean milk is necessarily one of reducing contamination from all outside sources to the least possible factor. Milk properly drawn, from healthy cows, in clean surroundings, handled and delivered in a sanitary manner is free from harmful bacteria and is ideal as a food.

Dirt must be kept out of the milk as neither straining nor clarifying will remove it or the bacteria it contains.

A dairyman must not be misled with the idea that new sanitary changes and equipment mean sanitary milk in themselves. The character of the output depends upon the man himself rather than upon his equipment.

Sanitary remodeling is of course an individual problem on most farms but the preceeding general principles and suggestions may be of assistance to some.

Muck as a Fertilizer.

A top-dressing of muck on upland soils should prove helpful in a number of ways. Whether the soil be light or heavy, the incorporating of muck should increase its moisture-holding capacity. If the soil is heavy the presence of the muck should improve its ventilation materially.

The presence of the muck in any upland soil will darken its color, and thus increase the capacity to gather the heat or the sunshine. The temperature of the soil is thus raised. In sunshiny weather during the heated portion of the day, such a soil is likely to be several degrees warmer than one in which no muck has been incorporated.

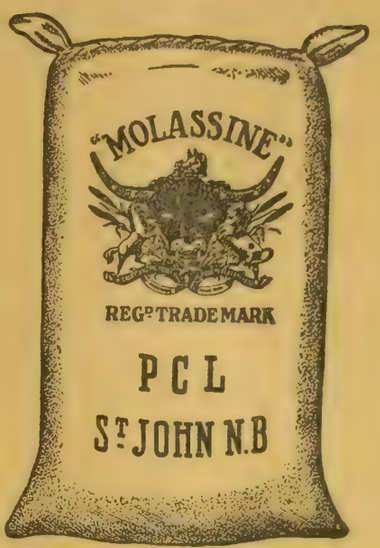
The fertilizing value of muck is variable. The total content of the nitrogen of muck soil may range from 5 per cent. to 4 per cent. It is a notable fact that the nitrogen of muck soils is not so readily available as the nitrogen of the organic matter of upland soils. Nevertheless its presence, even in quantities such as would be applied to the top-dressing referred to, should prove helpful from the fertilizing standpoint. In a large number of determinations which I have made, it was invariably found that the per cent of nitric nitrogen in muck sails was much higher than in the best upland soils. Nitric nitrogen is the form in which plants most largely use nitrogen.

If the sparse vegitation on this muck is due to improper drainage, that fact should make little difference in the value of the application of the muck to the upland soils. In some cases areas of muck are found upon which no vegetation will grow because of the presence of some undesirable substance.—Michigan Agricultural College. J. A. Jeffery.

This is the season of the year when mothers feel very much concerned over the frequent colds contracted by their chilhren, and have abundant reason for it as every cold weakens the lungs, lowers the vitality and paves the way for the more serious diseases that so often follow. Chamberlain's Cough Remedy is famous for its cures, and is pleasant and safe to take. For sale by all dealers.

GOVERNMENT ANALYSIS

Send to the Department of Inland Revenue, Ottawa, and ask for Bulletin No. 241 on Registered Stock Foods. It will be sent you FREE of all costs. In this Bulletin you will find the analysis of the different livestock preparations. You will also find that MOLASSINE MEAL, referred to on pages 6, 7, 12 and 13, is found to be 50% above the guarantee in protides and fat—and below its allowance of fibre or waste matter.



MOLASSINE MEAL

Made in England

Do not confuse MOLASSINE MEAL with other molasses preparations. There is only ONE MOLASSINE MEAL and that is made in England. It is recognized all over great Britain as the greatest Livestock Feed known to science. The leading veterinary surgeons all recommend it—The Mounted Department of the British Army use it—The Large Carting Companies, Omnibus Companies and owners of horses doing heavy work or for show and breeding purposes, all use it. It prevents and eradicates worms, enables you to get the best work out of horses—Cows will give more milk with greater percentage of butter-fat—Steers can be fattened for market quicker and cheaper and all your stock will be in better condition when fed regularly with MOLASSINE MEAL.

See that this Trade Mark is on Every Bag.

MOLASSINE MEAL can be obtained at most leading Feed Dealers—but if you can't get it from your dealer write us direct and we will arrange with him to supply you.

How To Make More Money

We want you to write to-day for our Free Booklet on feeding livestock and all about MOLASSINE MEAL.

Address.....

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issle. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

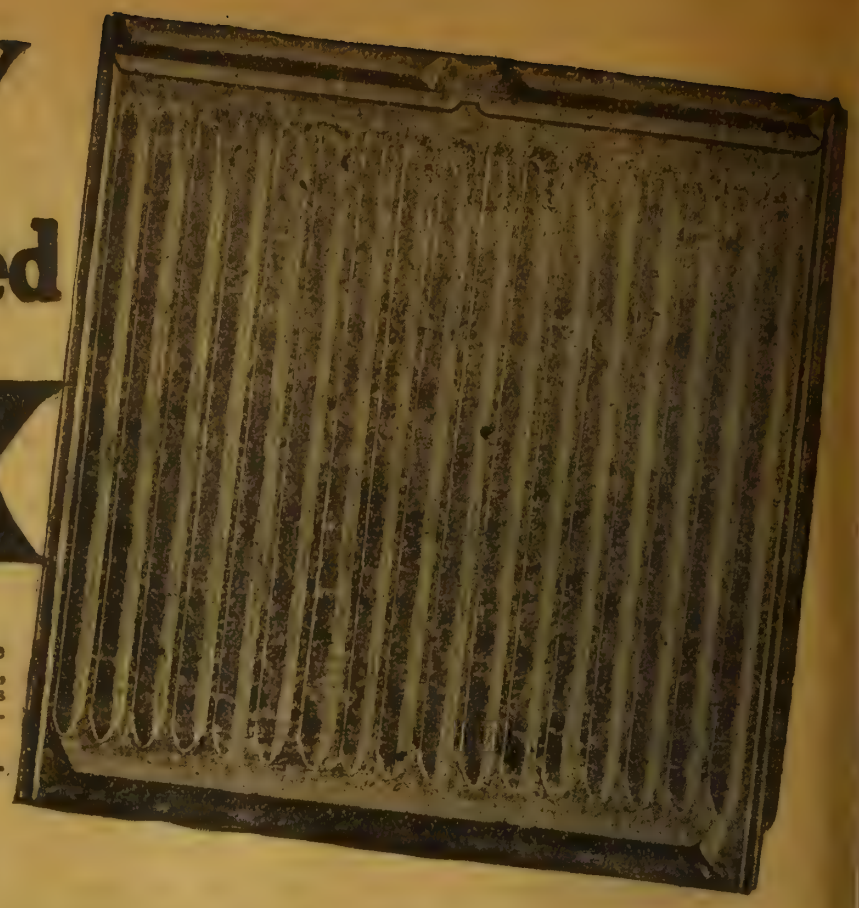
"HILLSIDE STOCK FARM"

We have for sale at right prices four Ayrshire bulls from twelve to fifteen mos. old. They are sired by the champion bull of 1911; a son of the renowned Scotch champion "Spicy Sam."

Prescott Blanchard, Truro, N. S.

"Use My Big, New 'George' Shingle and My Corrugated Iron on the Roof and Walls of your Barn"



"I HAVE just gotten out this new, big shingle for barns in 24 x 24 inch size. My son, the late Geo. H. Pedlar, Jr., invented it. It saves immense labor, and makes a fire-proof, lightning-proof barn roof, at about the cost of cedar shingle. It needs neither paint nor repairs. You can get it from any of my branch offices."

G. H. Pedlar

"I HAVE been making metal shingles for two generations to give farmers barn roofs that would not burn or leak. I put improvements into my shingle, year by year. Today my 'Oshawa' 16 x 20 inch shingle is sold all over the world, from Arctics to Tropics. It is made in metal that will last 100 years, and that it took me fifty years to find."

"But now I have a new shingle, 24 x 24 inches in size. I call it the 'George,' after my son. This shingle is so big that it pays to lay it instead of cedar. Only twenty-five 'George' Shingles equal the roof area covered by 600 cedar shingles. So much high-priced labor and time is saved by my shingle, and good cedar shingles are so dear, that a 'George Shingle' Roof costs you less than a cedar roof."

"I want to save you this money. You not only save money on your barn roof, but you make your roof fire-proof, perfect, clean and avoid repairs or leakage or paint cost for the future. Get my new big 'George' Shingle."

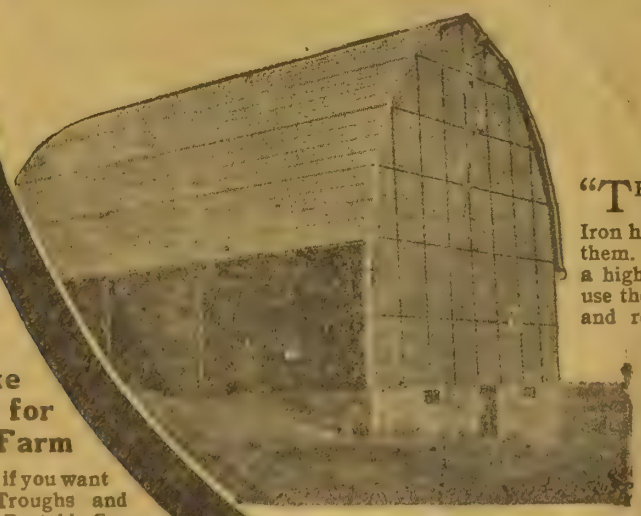
"I want you to go still further in saving money and getting a better barn. Instead of wood siding, put my 'Perfect Galvanized Corrugated Iron' on your barn walls. Because it is in big sheets, labor time and cost is saved to more than pay the difference between good lumber for siding and my iron, as siding."

"My Corrugated Iron braces your barn framing and strengthens it against sagging and wind pressure. It makes your barn fire-proof and saves insurance. It gives you a warm, dry, clean barn. It needs no paint or repairs, and is a nice gray color."

"Here is my plan again. To better your barn, make roof and walls of metal that will not rust, and that need no repairs or paint. To make this barn actually cost less than wood, get this metal in big enough units to save big labor. This means my 24x24 inch 'George' Metal Shingle, and my Corrugated Iron in 24 square feet sheets. This way pays big money to the man who does it."

G. H. Pedlar

THIS NEW BOOK FREE



"THIS new kind of cost-saving, high-class barn with 'George' Shingle and my Galvanized Corrugated Iron has been built. Farmers are just starting to build them. Lumber and cedar have reached such a high price and labor costs so much to use them, that it pays to get the barn walls and roof in ready-made metal, made by machinery in my factory."

"I have written a book that I want all my friends to read. I have a lot of pictures in it. One set of pictures shows a barn from start to finish. These pictures show how my 'George' Shingle is put up, the scaffolding to use, etc. They also show how the big sheets of my zinc-covered Corrugated Iron go on the walls. Write for a copy. Make a fire-proof barn at low cost my way, with my products."

G. H. Pedlar

I Make Helps for Your Farm

Write me if you want Metal Troughs and Mangers, Portable Granaries, Metal Tool Sheds or Portable Garages for Automobiles. My Flume and Portable Houses suit farm needs. I also make Metal Tile and Art Sidewalls to line your Kitchen, and Ceilings. I make Culvert in metal for your farm or highway bridges. I make Special Skylights in Metal for Barns.

A "Cockshutt" Drill Makes a Bumper Harvest

GET a Cockshutt Drill. You will benefit for many years. You will give your seed and your land a fair show.

You sow in rows six inches apart. This means you get three to five extra bushels, just by using a Cockshutt drill. Remember this is profit. These extra bushels are found money for every acre you seed with a Cockshutt.

Plan right now for a new seeder—write us a letter asking for details. Remember, this means $50 to $100 of extra profit for you for years to come.

SEND US A POSTAL!

Write us a card. Say "I want more information on Cockshutt drills." This does not obligate you to buy. It will get you facts about the Cockshutt—show you how perfectly designed it is. This is one of the lightest draft drills on the market. That alone ought to give it the preference. But when you consider its effectiveness—the harvest it brings you, the crop it protects, the early spring growth it insures, the Cockshutt Seeder is THE DRILL. Write that card to us to-day, please. Now is the time to investigate.

THE Cockshutt Drill is made with a strong I-beam frame that keeps all discs at the same height. It is carried on wide-tire wheels revolving on short axles with renewable bushings. The draft is always light. The discs are self-cleaning. They drop trash automatically. The boots cannot clog with mud. The discs sre self-oiling. The feed won't smash, break or bruise the kernels--is always accurate.

Your Crop Needs a "Square Deal"

The Cockshutt Feed gives you perfect control of the seeder. The feed is always just right for your land. The "I"-beam keeps your drills up, without sagging. This means that you sow just enough seed at just the right depth for a quick start. You get prompt, early, even growth—half the battle for a big harvest.

KEEP YOUR TEAM GOING

The Cockshutt disc "draws away" from the trouble-proof grain boot. As trash rises on a disc, it simply falls off, instead of wedging. This keeps your drills running steadily. You have no stops. You sow without an hour's delay from the day you start seeding till you are done. This means big money saved in wages, and full advantage of spring growth.

GUARD AGAINST DROUGHT

The close-set rows seeded only six inches apart are protection against drought. Your crop shades your land so well in June and July that drought trouble is minimized. The Cockshutt Drill brings you the full benefit of summer rains, simply by giving a compact crop that uses every drop of rain for growth.

Get Five Extra Bushels Per Acre

With the Cockshutt your crop gets an even, early start. It grows compactly. It takes full advantage of summer rain. It ripens evenly. It gives the same crop on six acres that you now get from seven acres. You get five extra bushels per acre per year using a Cockshutt Drill You don't pay a cent extra for seeding--in fact, you pay less wages and do the seeding quicker.

Dustman's Book of Plans *and* Building Construction

By U. M. DUSTMAN, (*Licensed Architect*)

10,000 Sold in 30 Days **Price $2.00 Prepaid**

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS: General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying out a building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barns, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions For Mixing and Placing Concrete—Proportions—Sand and Gravel—Itamized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to THE MARITIME FARMER to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and THE MARITIME FARMER for $2.00 These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

THE MARITIME FARMER, SUSSEX, N. B.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

Put in a BT MANURE CARRIER for the SPRING

YOUR cows will be in the barn for two months more—and its slow, heavy work *wheeling* the manure through the muddy yard. A BT Manure Carrier will do the work in *half* the time and without *any* hard work on your part. You can load it, run it out, and dump it on the pile or into the spreader *in a jiffy*—half-a-ton of manure at a time—one big load cleans your stable. It's easy to get the manure *rods* away from the barn for the level overhead track is not affected by any condition of the yard.

NOW IS THE TIME TO INSTALL A BT MANURE CARRIER. It will save you enough time and enough tedious work in the spring months alone to almost pay for itself. Mail the coupon to-day for our Catalog and investigate

OUR SPECIAL OFFER

If you will put in a BT Manure Carrier *now*, we will give you our best cash price, and make it payable in the fall. This offer gives you three months' use of the BT Carrier, without costing you anything. The spring is your busy time. Get a BT Manure Carrier to help you with your chores—get it now on easy fall terms.

SEE AND TRY A DE LAVAL CREAM SEPARATOR

Be Your Own Judge

We cannot believe that there is a sensible man living who would purchase any other than a De Laval Cream Separator for his own use if he would but SEE and TRY an improved DE LAVAL machine before buying.

It is a fact that 99% of all separator buyers who do SEE and TRY a DE LAVAL machine before buying purchase the DE LAVAL and will have no other separator. The 1% who do not buy the DE LAVAL are those who allow themselves to be influenced by something other than real genuine separator merit.

Every responsible person who wishes it may have the Free Trial of a DE LAVAL machine at his own home without advance payment or any obligation whatsoever. Simply ask the DE LAVAL agent in your nearest town or write direct to the nearest DE LAVAL office.

DE LAVAL DAIRY SUPPLY CO., LIMITED

Silage Would Increase Your Dairy Profits

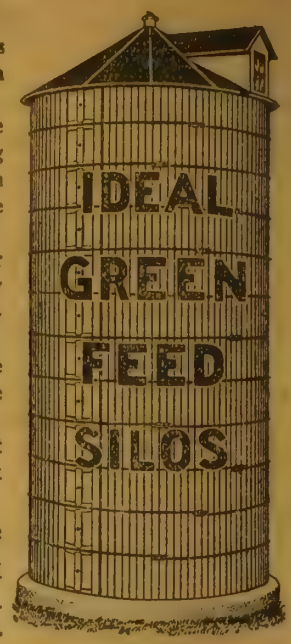
This winter weather, when dry feeding is reducing your dairy out-put, don't you often wish that you had erected a silo last summer?

If you had done so you would right now be feeding your cows succulent and milk-producing silage, just as good a milk-producing food as green summer pasturage, and getting a good deal more milk and making more profit out of your dairy.

All successful dairy men now-a-days consider a good silo a very necessary part of their dairy equipment and there is no question but that feeding silage greatly increases the milk flow.

If you haven't a silo perhaps you have made up your mind that this is the last year you are going to get along without one.

If so, don't put off ordering it until late next summer and perhaps find yourself in the same fix next year.



Write to-day for 48 page Ideal Green Feed Silo Book

This book contains much interesting and valuable information about silos, silage and silage feeding, and even if you are not yet ready to buy, you will find the book interesting and instructive.

More than twice as many Ideal Green Feed Silos were sold last year than in any previous year. If you keep cows you need a Silo. Full specifications are given in the Silo book. Be sure to write for it.

We are exclusive distributers in Canada of the World's Standard De Laval Cream Separators, and also carry a complete line of creamery and dairy machinery and supplies. If interested write for separate catalogs.

Our Sole business is the manufacture of

SPRAMOTORS

That's ***the big reason*** why you only hear of ***Spramotors*** and ordinary spraying outfits now-a-days. The ***supremacy*** of the ***Spramotor*** in every class is unquestionable. It would be marvellous if we couldn't produce ***more efficient, economical and durable*** machines than our competitors—since they look on the manufacture of spraying outfits as a ***side*** line. —while we have ***concentrated our capital, energies*** and ***brains*** on the ***perfecting*** of ***Spramotors*** for seventeen years.

It does not matter what your spraying needs may be there's a ***Spramotor specifically built*** for ***your purpose***—a machine that ***will do more*** and ***better*** work than any other spraying outfit in its class—a machine that will give you ***endless satisfaction*** because ***it is built to endure.***

Hundreds of farmers have proven the H.P. Spramotor (see cut) to be a very profitable investment. The horse does everything but direct the nozzles. This machine can be operated by hand where preferred. Has 8 nozzles that cannot clog—the number can be arranged to suit requirements. Prices range from $6.00 to $350.00. Equally effective for vineyards, row crops, or grain work.

State requirements and we will forward interesting facts without placing you under obligation to buy.

Volume 18. SUSSEX, NEW BRUNSWICK, MARCH 11, 1913. Number 11.

The Beneficial Effects of Drainage.

An Addrrss by D. C. J. Lynde, McDonald College, Before the Recent N. B. F- &. D. A., Fredericton, N. B.

AS the president has said, I am to speak to you to-night on drainage, and I should like to introduce my talk by giving you extracts from Bulletin 174 of Ontario Department of Agriculture. In 1906 the Ontario Agricultural College, with the aid of the Provincial Government, offered to make free drainage surveys for the farmers of Ontario. This offer has been made and widely accepted every year since.

In 1909 Prof. H. H. Day, who had this work in charge, wrote to a number of the farmers for whom surveys had been made, and asked them to state what the returns has been in crops. These replies were published in Bulletin 174. I give you a few.

QUOTATIONS FROM REPORTS BY MEN WHO HAVE DRAINED.

William Bell, Washago, Simcoe: "I drained eight acres you surveyed for me in 1907. It had produced nothing previously. Last year I grew a fairly good crop of oats on it, which yielded 33 bushels per acre. Following is a statement of outlay and results:

Cost of draining 8 acres, $290.90—$35.11 per acre, including a 6 inch main to drain other land as well as this.

Returns—33 bushels oats at 45 cents—$118.80, nearly half cost of drainage, and straw yet to be accounted."

T. S. Biggar, Manager, Walker Sons, Walkerville, Essex: "On our drained land this year, 1909, we had 80 bushels of shelled corn per acre, while the undrained gave us only 56 bushels. Of oats we had 66 bushels on drained and 37 on undrained. In 1908 the drained land gave us twice as much as the undrained. We have tiled 87 acres this year, and purpose tiling much more next year."

J. H. Clare, Chapman, Hastings: "Fields that previously were unfit for crops at all can now be seeded on even date with high land; and, while before they grew nothing but coarse grass, now they yield per acre:

Hay—2 to 3 tons. Oats—40 to 100 bushels.

Barley—30 to 50 bushels. Corn—14 feet high."

James Clayton, Cedar Springs, Kent: "In 1901 I drained 8 acres at a cost of $112 or $14 per acre; 8 acres right across the fence was not drained. In 1902 both fields were sowed to beans; 8 acres drained land gave 302 bushels, which sold for $456; 8 acres undrained land gave 24 bushels, which sold for $37.

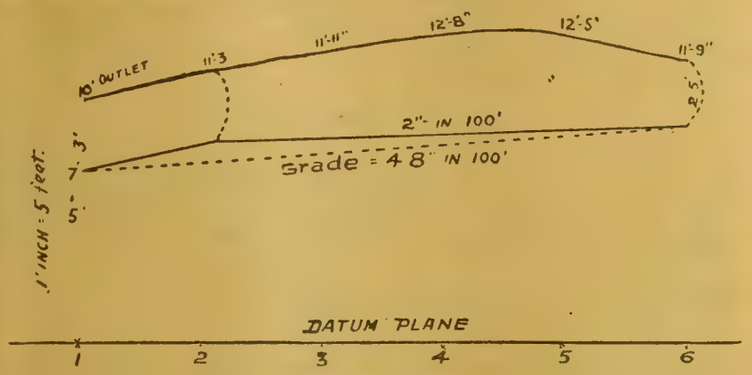
"Gain, $419, nearly four times the cost of drainage.

Author's Note: This example shows the value of underdrainage in specialized agriculture.

"In 1903 both fields grew fall wheat. Eight acres drained land gave 45 bushels per acres; 8 acres undrained land gave 25 bushels per acre. Gain, 20 bushels of wheat per acre. 1904—There was drained land on botg sides of that fence."

W. J. Cohoe, New Durham, Brant: "About two-thirds of the oat field was drained last fall, and this went in in good condition, April 30th. The rest of the field is porous soil, but rather level and higher than the drained part, and we sowed it three weeks later; and I must say it was not really fit then, but, anxious to get it sowed, we 'mudded it in.'"

Nathan Day, Powles' Corners, Victoria: "I drained a 10-acre field some fifteen years ago, at a total cost of $145 or $14.50 an acre, the drains being four rods apart and two and a half feet deep. It was a muck soil, from a foot to a foot and a half deep, underlaid with a heavy clay. Before draining it was the wettest field on the farm, and would grow only hay and oats, and never more than a half crop of them, and often not that, and was never sowed before June. Since draining it is the second driest field we have, and will grow a full crop of anything that can be grown on the high land on the farm. It has been sowed in April every year but one since it was drained. The drains paid for themselves in two years. If I were draining this field again I would put a drain every two rods, for the crops are always better right over the drains than halfway between."



Drainage Plan

F. W. Huntley, Sutton, York: "We drained part of the land surveyed, and this year a fine crop of fall wheat is growing on land that formerly was counted too wet for anything but meadow."

William Lamb, Brantford, Brant: "I think underdraining the best investment I can make on my farm."

Joseph Lapp, Cedar Grove, York: "I drained five acres, with drains 120 feet apart (110 rods on five acres). Drained another field, with drains 30 feet apart and 3 feet deep. In each case the gain in the first crop paid the full cost of the drainage.

"My general conclusion is this: Where drainage is at all required, its entire cost will be repaid by the increase in the first two crops, but in most cases by the increase in the first crop alone. Our own experience is the latter."

A. Leach, Farm Manager for W. F. Maclean, M. P., Donlands, York: "The cedar swamp field south of the barn, which you surveyed, and which, as you will remember, was so wet, even in the driest part of the summer, that one could not walk on it without getting wet, was drained last fall; and this year, in spite of the heavy rains which delayed all spring farming operations, it was the driest field we had when we came to cultivate it, although much of our land is high and rolling. The crop sowed on it is coming on fine, and gives every indication of good, stiff strong growth."

James Marshall, Hamilton, Wentworth: "In fifteen years I have put in over twenty miles of drains on my farm, and my only regret is that I have not used more of my spare time and attention to complete the underdraining and bring the whole farm into a better state of cultivation. In 1897 I drained a 12-acre field, at a cost of $460, almost $40 an acre, drains being 25 to 30 feet apart and 3 feet deep. The next year this field yielded 80 bushels of oats per acre, while the adjoining field of similar soil, but not drained, yielded only 45 bushels per acre, thus gaining 35 bushels of oats per acre by drainage."

Author's note: Price of oats by to-day's paper, 44 cents. Value of 35 bushels at 44 cents, $15.40, considerably more than one-third price of drainage, and the increase of straw yet to be counted.

"Another year I got the following results; 35 bushels wheat on drained; 25 bushels on undrained, thus gaining 20 bushels."

Author's note: Wheat to-day, price $1. Value of 20 bushels, $20, over half cost of drainage, and straw yet to be accounted.

R. H. McCurdy, Vienna, Elgin: "Last fall I drained two acres that formerly would grow nothing. They were low spots in a field. Cost $17.50 an acre. This year I had 30 bushels of fall wheat per acre on them while the higher land gave only 15 bushels. The drains more than paid for themselves with this one crop. The whole 30 bushels was gain, as those spots would grow nothing before."

Author's note: Value of 30 bushels at to-day's market price, $30.

John McIntaggert, Brechin, Ont.: "Last fall I drained the lowest of the land you surveyed, putting in over 500 rods of tile drains. Other years I was unable to work on it till the last of seeding, but this year it was the first ground I could work on, and was all of a month ahead of high land."

These replies go to show that the farmers of Ontario consider underdrainage a good investment.

I have had charge of the drainage survey work at Macdonald College for the last four years. During that time I have met many farmers who were interested in drainage, and they have asked me many questions. For my talk to-night I have made a list of the questions most frequently asked, and I shall answer them to the best of my ability. I believe that this is the best way in which I can answer the questions which you probably have in mind, and which you would ask if we had the time to talk it over man to man.

These questions and their answers are as follows:

Why should I underdrain my farm?

(Continued on page 381)

Busy Ayrshires on Springvale Farm Near Amherst

Tried and Proved in the Dairy Test

About three miles from the town of Amherst is located Fred. S. Black's Springvale Farm. Mr. Black is nothing if he is not a lover of good stock and his farm is the home of a busy herd of Ayrshire cattle, Clydesdale horses and a splendid flock of Oxford Down sheep. To shorten the distance between the farm and the town Mr. Black believes his trappy roadster, in whose veins is found a strong dash of Thoroughbred blood more than saves the price of his keep by saving steps for his heavy farm teams besides the extra satisfaction of being able to cover the distance in a much shorter time.

Among the most phenomenal winnings in the 1912 dairy test at the Maritime Winter Fair, was a trio of the Springvale Farm Ayrshires. It was no mean honor for one breeder to capture first prizes in three sections.

The trio depicted on this page carried off these honors for their owner with the following records:—

Neta of Springvale, aged 48 months, averaged 53.5 pounds of milk per day testing 4.1 per cent. butter fat and winding up with a total score of 206.18.

Rosalind of Springvale, age 36 months, first lactation period milk average per day 42 pounds testing 4.2 per cent butter fat and a total score of 166.61.

Pinafore 4th, of Springvale, age 28 months, average production during eral high testing show cows that test, 37 pounds of 3.7 per cent. milk and totalling a score of 133.42.

The Springvale herd was started in 1895 and exhibited for the first time in St. John, N. B., in the fall of 1896. Since then Mr. Black has been quite successful as a breeder and fit- of dairy stock. We have in mind sev- have gone forth from the Springvale herd and that changed hands on several occasions at handsome prices.

While attending the 1896 St. John exhibition. Mr. Black met Mr. Robert Robertson, who later became and still is Superintendent of the Experimental Farm at Nappan, N. S. Mr. Robinson was exhibiting his choice Ayrshire herd, and from him the two-weeks old bull calf, Matchless II was bought to become the future herd header on the Spriogvale Farm. Fifty dollars was considered to be a big price for a two-weeks-old calf in those days and many of the older breeders shook their heads in disapproval at such extravagance and prophesied Mr. Black's early ruin if he persisted in such transactions. Fifty dollars is a very ordinary price for a bull calf now-a-days. In 1897, Matchless 2nd was champion bull at Halifax and was the sire of the breeder's young herds that headed the list on several occasions at Halifax and St. John. The three cows that won first prizes in their respective classes at the 1912 Maritime Winter Fair dairy test trace back through more than one line to Matchless 2nd.

As a breeder, Mr. Black has kept producing qualities in view but he also has show yard animals in his herd and on more than one occasion he has been successful in capturing herd prizes at the fairs.

Blyth, the dam of the four-year-old Neta of Springvale, won second prize in strong competition as a two-year-old at the Dominion Exhibition held in Halifax a few years ago.

In 1899 the Springvale herd was strengthened by two in-calf young cows imported direct from Scotland.

In 1905, Mr. Black purchased one of the Clydesdale mares imported by the Nova Scotia Government. Another purebred mare was purchased to mate her in 1907. One of these mares is the dam of the stallion, Flash Favorite 2nd (11269), foiled on June 1st, 1908. Flash Favorite 2nd was on two occasions a prize winner at the Maritime Horse Show, at Amherst. Although under the four year old mark in the spring of 1912 in a strong class of eight aged stallions, Flash Favorite 2nd captured fourth place. Intending purchasers will do well to keep him in mind, as Mr. Black has not the time to spare during the rush of Spring and Summer work to attend to him as a stallion.

Mr. Black's boys, now in their teens are very much interested in the farm work and raise a considerable number of Barred Plymouth Rocks and Rouen ducks. They exhibit some of their burds in the utility classes at the Winter Fair and are usually successful in landing some of the prizes.

Mr. Black is of an unassuming nature and does make much ado, but his stock get there just the same, as testify his recent winnings at Amherst.

Not long ago we heard one of the most prominent Ayrshire breeders of Canada say that he believed more good producers had gone forth from the Springvale herd than from any other herd in the Maritime Provinces, and this breeder was in a position to know whereof he spoke, as he had had several of them in his herd and they had proved to be producers of showring offspring as well as giving a good account of themselves at the pail—a trait for which all practical breeders are now striving.

Neta of Springvale **Rosalind of Springvale** **Pinafore of Springvale**

A trio of First Prize Winners in the Dairy Test at the 1912 Maritime Winter Fair. Bred, owned, and exhibited by F. S. Black, Amherst, N. S.

Hay, Turnips, Potatoes, Strawberries, Oats

Rotation on Yarmouth County Farm

Editor Maritime Farmer:—

As this is the slack time of the year, if there is any slack time on a farm, I am sending you a few notes to let you know how we are fareing in the western part of our fair Province. As you know, the past season has been wet and cold with very little clear, fine weather and crops on the whole have not been as good as in the previous year. The hay has been badly cured except with those few who commenced early and had an abundance of labor. The grazing was good and so the dairy part of our operations has been a good business. Prices are good, and just here let me say to any young man going into farming, stick to the cow and she will enrich your farm and add very materially to your income. She will be making milk while you are sleeping, besides increasing your stock without which one cannot farm successfully. Occasionally we hear men say "there is so much work in connection with the dairy and the keeping of cows." Well, suppose there is, any man who is afraid of work should have no place on this earth and he should be put aboard a flying machine and started on an angle of about 45 degrees upwards with gasoline in the tank sufficient for the voyage.

Harvesting Turnips—1200 bushels per acre

On S. A. Cook's Jersey Farm, Central Cheboque, Yarmouth Co., N. S.

The man who gets a living without work is simply a shirk. Some one else is having that much more to do. Why, the greatest joy of living is to go out in the morning and bare the arms, throw back the collar and pitch in, and when night comes to have the satisfaction of seeing a lot of work accomplished, and no one the poorer. In fact, the community in which you live, and for that matter, the world is that much better for your day's work.

I am afraid too many of our farmers do not know their calling as they should. If they did, we should see more of them in our legislative halls and more of our boys remaining on the farm, both of which would be better for the country.

Now, with conditions as they are today, there is more than one way to farm. If one is situated so as to be able to dispose of green truck there is scarcely any end to what can be raised. Then there is the small fruit end. In my opinion mixed farming, for the man who can keep things moving, in proper rotation, is the most economical system of agriculture as it evens the work throughout the year. We read of the larger profits in the sheep business which may be all right if one has a range large enough of land not suitable for tillage, but a man whose holding is small and suitable for tillage should never think of going into sheep raising.

The rotation practised on my farm is as follows:—

(Continued on page 407)

Raising Poultry For Profit---How to Begin

Hens are not what they used to be. There is MONEY IN HENS to-day, and for that reason farmers and others should raise more of them than they are doing at present. There are not nearly enough hens in New Brunswick to-day, and a good many that are here are unprofitable servants. Some of them not only eat their eggs, but they eat their own heads off also. Now the only way to make money out of those hens is to use the hatchet yourself, and use it right away. Do not put this matter off until tomorrow unless you happen to run across this issue of THE MARITIME FARMER on Sunday, and even then there might be found some justification of the act on the ground of NECESSITY. A man must live, but every unprofitable hen should die instantly. That reminds me of a remark that a friend of mine in Halifax made to a gentleman who inquired of him "How are your hens doing this winter?" "Better, thank you, much better. My eggs are only costing me three dollars a dozen this winter. Last winter they cost me five."

The unprofitableness in the first instance arises from the wretched practice of so many farmers who keep nothing but SCRUB—inbred, criss-cross—and consequently, semi-barren stock. There is no money in that kind of hens.

In the second case, my friends eggs cost him a very fancy price because, in the first place he bought very fancy birds—birds that were bred "to show" instead of buying birds that were bred "to lay." Then he housed them too expensively and fed them on too expensive food-stuffs. It is not always the food that costs the most that is the best food for laying hens.

Nevertheless, it is possible to raise hens that pay, and that pay handsomely, winter and summer. The writer is willing to confess that he has in former times succeeded in making hens pay, that he is making them pay today, and that he, after twelve years experience in the business of keeping poultry for profit, believes hens to be—next to black foxes—one of the most profitable things about any house or farm. We have in Canada today perhaps about fifty million hens, but to be moderate, for statistics are not at hand, let me say forty million, and on the basis of one dollar a head profit—and almost any blockhead can make that much these days—we have a cash value of forty million dollars a year. Do you wonder now why roosters crow so early in the morning?

With these few introductory remarks we will now proceed to business.

My advice to any one who has never raised "Poultry For Profit" is to begin with a few hens and work up. Learn the business with a few hens and then you will be able to look after a large number and make them pay you a handsome profit. But you must first make the smaller number pay, else it would be folly to hatch out a large number. If you cannot make twenty hens pay their keep, you will never make a thousand keep you.

The first thing necessary is a suitable house and run. For a few hens, 15 or 20 a small house (8x10) with a window facing south will do nicely. Do not make the house too warm, but make it tight, and put a floor in it so that the hens will be free from dampness at all seasons of the year. A hen will thrive in ten degree of frost, and lay regularly, but she will not thrive at all in a damp house or one that has open cracks through which the wind blows. If the house is well made, the window may be removed and left open every fine day winter and summer. If a hen has plenty of fresh air it does not matter so much about the amount of floor space she has, though it is well to give each hen at least three square feet.

For a pen of 25 hens of the larger breeds, such as Rocks, Wyandottes, Reds, etc., the house should be about (8x14) or (8x15) though the latter is quite large enough. For a pen of from 40 to 50 the house must not be less than (8x16), but better (9x18) or 20x17. It is not well to keep over 50 hens in any one pen. It will pay you to divide them into two pens. The lighter breeds, such as Leghorns, will stand crowding better than the others, but it never pays to crowd any breed too much.

There is a little gold mine in hens for the man on the farm who will give a little time and attention to them, and even the city dweller who has a good back yard to his lot and a little ingenuity in his head can make hens pay well, and provide for himself a most interesting diversion at the same time. Here is the experience of one city breeder who had only a city lot, 30x120 feet:—

Average number of hens kept during the year, ...	25
Average number of eggs laid by each hen;	138
Received for eggs and poultry sold	$162.89
Paid for grain, fixtures, etc. ...72.36	
	$90.53
Increase in value of stock on hand	40.00
Net profit	$130.53

Many others have done as well or better than this, and no man knows just what he may do until he tries.

In August 1911 the writer bought 170 Rhode Island Red chickens that had been hatched in an incubator in June and July (two months too late) and raised them out of doors until November, when all were killed except 75 pullets. I did not want to buy those 170 chickens for two reasons. First, because they were hatched late in the season, and, secondly, because I had only a town lot, though a pretty large one to raise them on, and it contained only one hen house capable of containing about thirty hens; but the man who hatched had contracted "cold feet" and wanted to sell out, so that when I tried to buy thirty pullets, for which I was willing to pay $25.00 or $30.00 he absolutely refused to sell unless I would take the whole lot. I asked "How much for the bunch?" The reply was, "give me $20.00 and I will throw in a whole roll of chicken wire to boot." I protested that the price was too low and paid him considerably more than he asked. The chickens were removed to my lot and raised in packing boxes until I had time to build a winter laying house for them. The pullets laid two eggs on Dec. 17th and by Jan. 17th they were running about two dozen a day. By the middle of Feb. they were yielding from three to three and one-half dozen per day. In March they averaged about four dozen a day. In April and May they had increased to nearly five dozen a day and laid like clockwork. On August 23rd (12 months from date of purchase) I balanced my books, and found that on the whole transaction I had made $114.00 over original cost of chicks and feed for twelve months—that is $1.52 per each laying head. Do you wonder now that I am wintering 135 head of laying stock this winter?

W. H. Moore, Scotch Lake, N. B.

Newly elected President of the New Brunswick Farmers' and Dairymen's Association.

And to-day, Feb. 13th, though the thermometer must have registered away below zero, I had the pleasure of bringing in 40 eggs at 3 p. m., and 10 more at 5.30 p. m. making a total of 50 eggs, which at 30 cents per dozen are worth $1.25. My feed bill is running now about 60 cents per day during the hard winter months, so that to-day I have made a clear profit of .65 cents, or at the rate of $4.55 per week. The fourth commandment does not apply to hens in this country, or at least mine do not obey it, for they laid their first eggs on Sabbath, and often Sunday is "high day" with them. Strange to relate, I generally get the largest number of eggs on the coldest days in the week or month. In this respect my hens have been a wonder unto many.

WHAT BREED SHALL I KEEP?

The beginner is often perplexed to know what breed to keep. After twelve years of experience and careful observation, I have come to the conclusion that there is no "best breed" of hens, as almost any breed will give good satisfaction if properly cared for. Any of the American breeders, Rocks, Wyandottes, Reds, etc., are good winter layers but persistent setters during spring and summer months. That is, they will lay well when eggs are high in price, and ease off when eggs are low in price, and this, you will observe, is far from being a defect.

The Mediterranean breeds, e. g. Leghorns, Minorcas, etc., while not so hardy as the American breeds, have this excellent virtue that they do not set at all, and while fair winter layers, do their best work in spring and summer, when the Rocks and Reds are hatching out a new supply of chickens. By keeping a small pen of Rocks or Reds and another of Leghorns, one should have fresh eggs all the year round.

It may be worth mentioning here that since the 17th of Dec. 1911, there has never been a day, rain or shine, hot or cold, that we did not bring in a number of new laid eggs. During the first week of November, 1912, they were laying only about half a dozen a day, but by the middle of December they were averaging two dozen per day, and have been increasing gradually ever since. By the middle of next month I hope to bring in from eight to ten dozen per day and since I have a yearly contract for strictly fresh eggs my profits will materially increase for the remainder of the year.

SETTING HENS AND RAISING YOUNG CHICKENS.

Perhaps some knowing ones who read this article will smile at this sub-title and think it quite unnecessary to tell anyone these days "how to set a hen." Others may think that the "best way to set a hen is to let her set." Well, despite the smile it is still necessary to instruct a good many people how to set a hen properly, and I am safe in saying that not one hen out of every fifty is set properly. And, as to the motto that "the best way to set a hen is to let her set,-' I may say, that is quite true if you have only one hen, but where you have a large number it is a poor policy. First, then, to set a hen properly, you must have a box not less than 12x15 inches, but better 15x15 inches, into which put a couple of inches of good clean soil. Next, put in chaff or fine straw sufficient to make a comfortable receptacle for the eggs. The soil is necessary to supply moisture, and without a certain amount of moisture the chickens will not hatch at all, or if they do, they will always lack vigor and will prove unprofitable servants. A large percentage of the mortality with young chickens is due to the lack of moisture during incubation. Next put a couple of eggs into the nest and then place the box where the broody hen will easily find it, and if she does not find it within a reasonable time, then find the hen and place her on the nest. If she settles down upon the eggs and remains there for a day, you may safely give her the eggs intended for incubation, and then remove the box to some place where she will be entirely sepfood and water within easy reach and you will have the best kind of arate from the laying hens. Place incubator now on the market. The hen will come off and go on again if she is left undisturbed, and will require no further attention. On the tenth, and again on the seventeenth day after setting, the eggs should be sprinkled with warm water, and if any eggs are broken see that all the contents are removed from the nest and eggs, otherwise the eggs will rot and not hatch at all.

On the twenty-first day the chickens should hatch out, but do not disturb the hen before the twenty-second day and then it is well to remove the broken shells so that the newly hatched chickens may have more room and comfort in the nest. When the chickens are from twenty-four to forty-eight hours old they should be fed with finely-ground, hard-boiled egg and oatmeal mixed with a little sand. Place both new milk and water within easy reach. The drinking fountain should be of such a nature that the chickens cannot run into it, for wet feet are just as dangerous as to children. A cup turned upside down in a saucer will answer very well for the first few days anyway. When the chickens are a week old they may be fed a dry mash consisting of ground wheat, oats, cornmeal, middlings, bran, with a small quantity of finely ground oyster shells and beef scrap.

THE MARITIME FARMER.

And Co-operative Dairyman

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definate order for discontinuance is given.

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

THE SEED WE SOW.

Good farm land is too valuable to be used in the production of weeds and unprofitable crops. As long as present prices prevail, and they are bound to go higher rather than lower, the farm must be made to yield to the full extent of its capacity in order to make the largest dividend possible.

Farmers, like other business men, are not working for their health. Love of profit is a characteristic common to all humanity. It is this struggle for increased wealth that makes commercial and business life what it is, and the farm is no longer exempt from this condition.

There are various ways of increasing the capacity of the farm but the one that appeals most strongly to the practical man at the season of seedtime is the quality of the grain planted. With every harvest there is a certain amount of light grain, weak in germinating qualities and if allowed to grow this grain will reproduce its kind in succeeding years. This light grain finds its way into the feed bins and has some value as a feed but never as much as the large, plump, strong kernels. The harvest that contains nothing but grain of the first quality would be ideal and the way to approach this condition is to guard closely the seed planted.

Much has been said about saving the seed grain, grading it so as to secure an even stand and planting nothing but seed that contains strong germinating qualities. Farmers understand this situation and they are putting into practice the teachings that have been given on the lecture platforms and through the short courses and farm papers. They realize the importance of good seed and are profiting by the advice of these teachers through increased harvests and larger yields.

It is just as important that the small grain seed should be carefully handled and all the light kernels, the chaff and the weed seed separated before the grain is sown. In speaking of the wheat situation of the United States the assistant secretary of agriculture says that the yield should be increased from 15 to 25 bushels per acre. This increase of 10 bushels might be obtained by the use of better seed and by better preparation of the soil.

The same authority says: "The five bushels gained from breeding and planting good seed will not cost 10c. an acre." Just imagine the purchase of wheat at the cost of 2c. per bushel. Does it not look as if the investment were worth while, especially when one takes into consideration the fact that the principal item is the more careful handling of the seed? The same thing is proportionately true of other small grains.

In this connection it may well be said that the fanning mill is one of the most important machines on the farm just at this season. The corn grader unquestionably has its place, but the fanning mill is just as important in connection with the small grain crop as the corn grader is with that crop. In bye-gone days the fanning mill was used principally on the grain that went to market. Today it should be used on the grain that goes back on the farm. The modern thresher cleans the seed well but it cannot fit it for planting. Before sowing all the shrunken, weak and poorly developed kernels must be cleaned out if the best of results are hoped for at harvest time. It is poor policy to use high priced land, high priced implements and high priced labor to raise crops that are not of the highest quality. It is a problem to get the interest back on the land even under the best of conditions. It can never be done by following indifferent, slipshod methods.

Small grain has a place in the economy of every farm and wherever small grain is used the fanning mill is an important factor.

The only way to make the farm profitable is to use its entire crop yielding capacity. Before seed time this year look well to the small grain. Separate the weak from the strong, plant only the latter and the reward that comes at harvest time will be worth while.

THE FARMER AND HONEST BUSINESS.

The evolution of business and the consequent improvements made in business methods is one of the surest indications of progress. The growth of advertising and its vast opportunities for enlarging and building up a legitimate business is largely responsible for our growth in business ethics and the honesty and good intentions demanded by our people. People want those who manufacture, sell and distribute products to come out in the open, tell what they have for sale and give good reasons, if there are any, why their goods should be used. And this has driven out many unworthy articles and given merit in men and quality in products the advantage.

Farmers have been doubly benefited by honesty in business and quality in articles. In fact the farmer is very largely responsible for the evolution in our business system. So long as farmers were satisfied with shoddy goods at extortionate prices these flooded the market. But when the demand came for merit, for value and for service from those who supplied his wants, these were forthcoming.

Today the fraudulent dealer can not long remain in business. His only hope is to remain under cover and wait for those who do not read and keep themselves posted to accidentally get in touch with him. The up-to-date look for what they need, demand articles of value at reasonable prices and thus force the dealer to stand by his recommendations.

Another and a very important reason why farmers have derived great benefit from our improved code of ethics in business is that the progressive farmer of today is not a buyer only, but a seller as well. He produces articles which business men need and must have. The food supply of this nation must be produced on our farms and it must be delivered finally upon the tables of those who consume it. Livestock must be sold and many farm products converted into finished products before they leave te farm. Butter, bacon, hams, canned and evaporated fruits and many other articles are made on the farm and distributed, some of them direct to the consumer. This gives progressive farmers an opportunity to reap the rewards of honest business by getting his products before the people and selling these upon their merits. This widens ones circumference of selling and permits him to specialize in fields that offer the best opportunity for business service.

With the opportunity for advertising farm products has come a great need in education. It is highly desirable that one acquire a plain intelligible way of expressing himself; he should write a fair hand, use good language and impress his customers with his honesty and fair methods of dealing.

Our public and private schools have not always been as good as they are now and yet they are not now efficient. Many successful business men have been deprived of a practical education in youth, but this need not remain a handicap. By reading the agricultural paper and other good literature and giving close attention to correct English one can soon acquire a fair vocabulary. Practice in writing will be absolutely necessary in order that one may acquire the art of writing a correct and suitable business letter.

The lack of a practical education in youth is a great misfortune, but the progressive farmer will overcome such a handicap and take his position with business people. Success depends upon it, self-respect demands it.

THE ART OF FARMING.

In the minds of too many people the thought of art is associated with painting, sculpture, architecture; something lofty, sublimely ideal. But the old people of other days who gave us our language, had truer, juster ideas than we do now, for they comprehend the spirit of art in the word "artisan" as well as artist. But it remains for us to see that no man ever becomes a true artisan unless he has in him for guidance and inspiration the spirit of the artist. This is essentailly true in farming.

"Show me the true farmer and I will show you an artist," says a French writer. The artist will show in his plowing, harrowing and tillage generally. It will show in the character and arrangement of his buildings, in the form and finish of his animals, in the entire harmony and completeness of the farm. For what is art, but the perfectness of human effort?

Here is another thought: Art is born of and clings to human effort. It cannot be expressed in any other way. It shows only in the doing of a thing.

There is just as great a field for its unfolding on a farm as there is in a studio, only we have not thought or believed so. As farmers, we need to see the art side of farming more than we do. When we see that, we will lose sight of the drudgery view of farming. Said an English plowman when complimented on the perfectness of his plowing: —

"It's not so tiring sir, to plow well, for your mind is interested."

We do not wonder that some men get everlastingly weary of their work, for they do it so poorly. Of course they cannot take any interest in or receive any satisfaction for such work. They go to their bed ashamed every night. That must be very exhausting. We need more artisans, filled with the artistic spirit for the pleasure and profit of farming and the development of the farmer to be the man he should be.

IMPROVE THE OLD PLACE.

If you feel discontented and would like to try some other place or state for a home, don't let go of what you have until you feel sure you have found the right thing. This selling out and taking chances may make it necessary for you to spend a thousand dollars moving and then be obliged to come back and buy back the old place at a considerable advance in price. We have known this thing to happen a good many times. The truth is there is no best place. A man's success and comfort in living depends largely upon his ability to be contented and to make the best of what he has. The discontented man is far more likely to find the thing which he craves by an intelligent improvement of the land which he has and his unused opportunities than he is by racing all over kingdom come after it. There is hardly a farm anywhere which cannot be made more productive, more attractive, more valuable.

STOP THE WASTE OF MONEY.

One does not have to travel far to find farm implements out in the fields where last used. Hay loaders stay out all winter, plows are rusting in the furrows, harrows stand in some fields where stock may injure their feet by running upon them threshing machines often stand out in the elements for months.

Take care of farm implements and you will have nothing to say about a farm implement trust. The farm implement rust is costing the farmers ten fold more than the so-called trust.

The New Brunswick Department of Agriculture has been empowered to employ a qualified veterinary surgeon to examine any dairy herds suspected of being affected with tuberculosis.

The Beneficial Effect of Drainage.

(Continued from page 377)

Because you will get larger crops with the same or less labor.

Why does underdrainage increase the crops ?

(1) Because you can get on your land earlier in the spring and early planting gives larger crops.

Results obtained at Macdonald College, average of five years. Dates of seeding one week apart.

Fifth "	19.63	61 75	61.85	43.18	2600	1341
Sixth " 3 years.....	18.95	64.19	56.97	39.37	2317	1075

(2) Because none of your seed will rot, seed rots chiefly because it lies in water after being planted.

(3) Because the plants can root deeper and thus they have a deeper feeding ground. The drains lower the water to three feet below the surface and the plants can send their roots down this depth.

(4) Because the plants stand a drought better on drained land than on land not drained. The roots of land plants will not grow in water. Therefore on land not drained the plants root shallow. When a drought comes the plants suffer or die. On drained lands, the roots go down at least three feet. They are thus nearer the water and stand a drought better.

A man who has his land drained fears neither wet weather nor dry weather. He does not fear wet weather because the drains carry off the water. He does not fear dry weather because his plants root deep and live through a drought.

(5) Because when land is drained to a depth of three feet, the soil bacteria thrive to this depth. Soil bacteria produce plant food. Thus in drained land there is more plant food than in undrained land, and this increases the crop.

Are there other benefits of underdrainage ?

Yes, there are other benefits as follows :

(1) The land is more mellow and is easier worked. This saves time and labor.

(2) You can work a whole field at once. You do not need to work around the wet spots.

This saves time and labor.

(3) You do not need to leave furrows and surface ditches to carry off the water. This saves wear and tear on machinery.

How deep are the drains laid ?

The drains are put, on the average, three feet underground.

How far apart are the drains laid?

The drains are placed from 66 to 100 feet apart that is, 66 feet in clay or heavy loam and 100 feet in lighter soils.

At what grade should the drains be laid ?

The drains are laid on as steep a grade as you can get, but 3 inches in 100 feet will give good results.

How are the tiles laid?

The tiles are laid end to end in the ditch and covered up. It is not necessary to cover the joints except in very fine sand.

Where does the water enter the the tiles?

The water enters the tiles at every joint. The tiles are one foot long and therefore in a drain 500 feet long there are 500 joints and water enters at each of these joints. This drains the land uniformly.

What is the cost per acre?

With the drains 66 feet apart, it costs from $10 to $15 per acre for the tiles. The cost of digging and filling depends upon the soil. There are 40 rods (660 feet) of drains required per acre. If this costs 50c. a rod to dig and fill, the cost is $20 per acre. The total cost is then $30 to $35 per acre. This is about the average.

How long will it take for the drains to pay for themselves?

For the years 1910 and 1911, it was found in the Province of Ontario that the value of the increase in crop per acre was over $15 per acre. That is, on the average, the crop on land after drainage was worth $15 per acre more than the crop on the same land before it was drained. At this rate the drains pay for themselves, on the average, in two years time.

If the drain becomes blocked, how can I tell where to dig to clear it?

If a drain becomes blocked, the water coming down from higher up cannot pass and therefore it rises to the surface and causes a wet spot in the field. You dig down in the wet spot, clear out the clogged tiles and put them back, and your drain is clear again.

TILES.

Which is the better, clay or cement tiles ?

One is as good as the other. Clay tiles have been down a hundred years in some parts of England and appear as good as ever. Cement tile has not been in use as long as clay tile, but cement is good everywhere we have tried it. All the evidence we have goes to show that cement tile, well made, is as good as clay tile.

Where can I get the tile ?

This is a question I am unable to answer for New Brunswick. I understand that clay and cement tile are made in some parts of the province. Those of you who live near the ocean can import good Scotch clay tile at a reasonable price.

If you live in parts of the country where tile are not made, I advise you to try to get your brick makers to make clay tile, and your concrete men to make concrete tile. If this cannot be done, I advise you to look into the question of making tile for yourself and for the country around you. The machinery needed to make clay tile is not expensive, and if you have good brick clay on your land and are handy to the railroad you may share a profitable business.

If you have good sand near at hand you can make cement tile. You can get a good cement tile machine, worked by hand power for $35.00, and a power attachment for $15.00 extra. This makes 3 in. tile. The extra attachments to make 4, 5, 6 and 8 in. tile cost about $40.00. A man can make about 380 to 500 3 in. tile per day. The smaller tile are made with a 5 to 1 mixture, and the larger tile 4 to 1.

The proportions are as follows:—

2 bbls. cement, 1 1-3 yds. sand make 1000 3 in. tile.

3½ bbls. cement, 2 yds. sand make 1000 4 in. tile.

4 bbls. cement, 2 2-3 yds. sand make 1000 5 in. tile.

5 bbls. cement, 4 yds. sand make 1000 6 in. tile.

The above is 5 to 1 mixture.

6½ bbls. cement, 4 yds. sand make 1000 6 in. tile.

10 bbls. cement, 7 yds. sand make 1000 8 in. tile.

Based on 4 to 1 mixture.

With cement at $2.00 a barrel, 1000 3 in. tile will cost you $4.00, plus the cost of the sand and your labour.

Cement tile must be cured slowly. They must be placed on wet planks, out of the sun, and way from dry winds. They must be kept moist for about one week.

Experts on cement tile recommend power machines, because it is difficult to compress the tile sufficiently with a hand machine.

How should I start to drain my farm?

The first thing to do is to have a drainage survey made of your farm. This leads me to the next part of my talk, namely,

HOW CAN THE GOVERNMENT HELP FARMERS DRAIN THEIR LAND.

The government can help farmers drain their land in three ways.

FIRST. The government can have free drainage surveys made for those who wish to drain their land.

I can best illustrate this by explaining how this is done in Ontario.

The Ontario Agricultural College trains a corps of drainage experts each spring. On application, one of these experts is sent to make a drainage survey of a farm.

There is no charge for the services of this expert, as his salary is paid by the Ontario Government. The farmer, however, pays his railroad fare at the rate of one cent a mile each way, meals, cartage, etc. He meets the expert at the station and re turns him to it, and provides any assistance necessary for the work.

The expert makes a complete survey of the farm, and prepares a map showing the location of the drains needed, the grade of each drain, and the number and sizes of tile needed. He also shows the farmer how to dig his drains true to grade, how to lay the tile, how to make joints, etc. The cost to the farmer averages about $2.00.

SECOND. The government can pass an Act similar to the Tile, Stone and Timber Drainage Act of Ontario. This Act enables a man to borrow money to drain his land.

Under this Act if a man wants to borrow money for drainage, he applies to the Township Council. If they approve, they issue debentures which are bought by the Provincial Government out of the Consolidated revenue Fund. A man can borrow up to $1000.00 at 4 per cent. compound interest. He pays it back in twenty annual instalments. These amount to $7.36 for each $100.00 he borrows.

Now $100.00 will drain 3 acres or more. If each acre returns $15.00 more than it did before it was drained the farmer gets $45.00 extra from the three acres, and it costs him $7.36. This is a profitable investment.

THIRD.—The government can encourage the introduction of traction ditchers. One way in which it can do this is to urge the Federal government to remove the duty from traction ditchers. A good sized traction ditcher costs $1700.00, F. O. B. at the factory. The duty is about 30 per cent., which adds $510.00 to the price.

If there is any considerable amount of drainage to be done in the province, a traction ditcher is a profitable investment for the individual. In this connection I may say that I have a friend in Ontario who started out with a half interest in one traction ditcher, and now has a half interest in eight of them. They are all busy all summer long, and all make money for him.

Agriculture for Clergymen.

Much is being said and some things being done to-day regarding the training of teachers for rural schools. But what is being done in the way of providing special training for the country ministers? The need for it is fully as great as for the teacher and the same argument holds good for both—namely, that any leader or public servant, to be truly efficient, must be in full sympathy with; must understand; and must live the daily life of those with whom and for whom he works. Farmers do not lead farmers, and here comes in the minister's opportunity. The country minister has become a leader, yes, a leader in better farming. For this leadership he has some advantages not possessed by the teacher. He is associated with the adults as well as with the children and young people, and he is not likely to be so migratory as the present country teacher, however, both teachers and preachers must know agriculture, and the social and economic conditions of farm life. This is positively fundamental. The minister of the country church ought to know more of what Jesus knew and what Zavitz, Cumming, Howitt, Dean and the Days know; that is, a great deal about farm crops, the flowers of the field, the cattle and the soil; in fact, he should know the science of agriculture right up to date. Arrangements should be made to give young ministers contemplating work in rural districts a course in agriculture. For much of the present neglect in the matter of special training for rural pastors our universities are accountable. The work of the theological school is not planned to meet the specific need of those entering the rural field. Perhaps the nucleus of the situation is that too few students purposely and consistently plan to undertake rural work, or to make it a serious life study. The country parish is regarded as a stepping stone, the sooner passed the better. We need a country clergy who will study the problems of rural life as city clergy study those of urban life.

It is an entirely wrong idea that the "back numbers" and the very very young among ministers will do for the country. There is no greater opportunity in the wide world for noble work by the young minister than in the rural field if he is properly trained for it. The sooner that students generally and theological students particularly appreciate the fact that the profession of agriculture is just as dignified as any other profession, and that the farmer is, in truth, God's best expression of an ordinary man, the better it will be for all concerned. There are many problems that a minister can help to solve. Business principles must be applied to farming; improved methods put into operation, and the farmer himself aroused from his indif' ference. These things cannot be accomplished by talk and bulletins; the farmer must be reached by the personal touch, and that through the occupation whereby he lives.

The church can inspire the country people with a desire to know and appreciate nature and rural life, and can also inspire the ideal of self-culture, but it must not neglect to encourage the use of such means and methods as will improve the quality and quantity of the products of the farm. Social, church and school prosperity rises and falls with production on the farms. It is very well to say that the farmer must give of his time and means for the enterprises which make for the good of the community, and that the salary of the [illegible] increased and the roads should be improved. But these things will be slow in coming, and society can have small claim upon the farmer until farming is made more profitable and the farmer is receiving a reasonable income for his labor.—F. C. Nunnick, Agriculturist Canadian Conservation Commission.

HORTICULTURE.

Some Pruning Notes.

Editor Maritime Farmer:—

In successful orchard management we now recognize three essentials: pruning, spraying and cultivation, and it is hard to say which is the most important. There is no question whatever which is the oldest practice, for pruning has been part of the orchard work as far back as the Garden of Eden it self. The Bible makes frequent mention of the pruning hook, and with an art so long established, it is strange that today we have so little definite knowledge as to what method to pursue to get the best results in both quality and quantity from our orchards.

We have advocates aplenty of all times and systems from those who practice no pruning at all, to those who every spring carve away at their trees until only a few whippy branches are left, and the unfortunate trees, instead of producing fruit, has to give its whole attention to trying to replace some of the leaf-bearing wood, that has so ruthlessly been robbed from it. No one who gives the question any thought can doubt but that work that is nearly criminal has been done in some of our orchards with a pruning saw.

Dr. Stewart, at the Fruit Growers' meeting in Middleton, got a laugh when he said, "prune just as little as you possibly can, as long as you prune enough." This may look like a joke but it isn't, and coming from whence it did, the statement deserves some thought.

When have we pruned enough? No one will deny that different varieties of trees call for different treatment. The King and the Wagner, for instance, are two extreme types, and the Golden Russett is in no respect like the Gravenstein, and to prune the King tree with its long, rangy limbs and spreading branches the same as you would the Wagner, a tree that grows straight up and makes little wood is to court disaster. Fifteen or twenty years ago it was the practice to cut out all suckers, and branches along the inside limbs of the tree, evidently with the idea that so much wood needed to be removed anyway, and it did not matter much where it came from. The results of these ideas we can see today expressed in old orchards all over the Valley, old trees with long, bare limbs, and a bunch of fruit bearing wood on the end like a paint brush. Evidently, something is wrong here, these trees have been pruned too much and in the wrong place.

Mr. A. McNeil, the veteran Chief of Fruit Division recommends that we should prune from the outside in, and not from the inside out, not to cut away large limbs disturbing the balance of the tree, but to thin out the small branches, such as can quickly be removed with the two-handed pruners familiar to every orchardist.

In his method of pruning a saw is seldom needed if the work is done systematically.

But perhaps Dr. Stewart had some idea like this in mind when he said, "as long as you prune enough," that one has done enough when he has thinned out the small branches so the sun and air are freely admitted to all parts of the tree.

Of course, any practical man understands that each tree is a separate problem. One is a strong upright grower and must be cut very lightly, another is not making sufficient growth and you can afford to use the saw in a more vigorous manner, for nothing will stimulate a sick tree like a severe cutting. Be sure to remove every trace of a diseased limb back to bright live wood. These should be taken from the orchard and burned as soon as possible, for such diseases as fire blight, cancer, etc., are very infectious and if not removed at once will soon infect other trees. If cut out as soon as seen, however, this trouble is not a serious one.

The King, under good cultivation, will have fruit almost too large for general use, so all the bearing wood possible should be encouraged. As a rule, a King tree heavily pruned is not a good croper. I had this forcibly brought to my attention some years ago in an experiment in my own orchard. Of three rows of Kings of the same number and age extending through the orchard, one row through press of work was not pruned. That row the following year had as many barrels of apples and as good quality as the other two rows taken together. I saw the point and have been very careful with the pruners when in King trees ever since. You can get any man's attention if you hit him with a brick.

We are now beginning to accept the idea that the suckers on the inside of the tree are not the enemy we once thought them. A sucker can soon be developed into bearing wood by pinching off the terminal bud thus causing fruit spurs to develop from the buds on the sides. In fact, an old tree can in a few years have its whole top removed by gradually cutting out the old wood and allowing new wood from developed suckers to take its place. Immensely better apples will be bourn on this new top and the life and usefulness of the tree greatly extended. The cutting back of young trees is not to be commended. I heard Dr. Stewart say it did not seem right to compel the tree to make the same wood twice. After it has attained full bearing size, however, the cutting back system gives good results. More fruit spurs are developed in the middle of the tree and the fruit is easiest to pick, to spray, and to thin. This system has not been tried out very extensively in the Valley as yet, but so far seems to be giving good satisfaction.

To prune the tree, however, will not take the place of thinning the fruit. Primarily, pruning stimulates a more vigorous growth, the balance between root and top is disturbed and nature ae once tries to destroy that balance by throwing out more wood. There must be a large leaf surface to digest the sap supplied by the roots for the roots are the mouth while the leaves are the stomach of the tree, and it is a fact worthy of notice that the men in this Valley who are getting the best results from their orchards in the way of annual crops, are those who are following the first part of Dr. Stewart's advice "Prune as little as you possibly can." This does not mean that they do not prune at all, far from it, but the work is done with brains as well as brawn and no limbs are removed without reason, nor is the work left entirely to the hired man. The problem is an important one to every orchardist. A certain number of branches must be removed each year. The question is how far to go and when to stop. It is an individual problem, too, and must be settled by each one for himself. The solution seems to be in watching results not only in one's own orchard but also in one's neighbors. If he is getting good results are we not to try to find out why the difference, and in the course of time, what is now dark will be made clear, if we faint not.—M. K. E.

San Jose Scale in Nova Scotia.

The editorial in the November issue of the Canadian Horticulturist gives a fair statement of the situation in this province. Your conclusions, however, do not agree with the ideas of the fruit interests here. The Nova Scotia Government, backed unanimously by the fruit men, are prepared to go to any extremes to eradicate the scale if possible, and provide against its further spread.

There is no panic but a straight business proposition on the part of all interested to cut out this scourge in the beginning, if effort and money will do it. Our Ontario friends, who have supplied us with one hundred and fifty thousand trees annually for the past few years, assure us that the scale is easily kept in check by dormant spraying, that it is a "blessing in disguise," etc. However this is one of the blessings that we would like to be spared, and are perfectly willing for Ontario to enjoy alone, rather than share with us. The fruit men are practically unanimous in agreeing to cease planting for a few years if necessary, till we see where we are at. We have been living in a fool's paradise, baying largely from Ontario nurserymen, depending on local inspection and fumigation, and we find that criminal negligence and carelessness have been the result. For instance, a Nova Scotia buyer in a large Ontario yard selecting trees, heard orders given by the manager to fumigate a lot of stock in a "box car!"

Of some one hundred and fifty thousand trees from Ontario nurseries received here this spring about twenty-five per cent. had scale on them—some literally encrusted. To be sure most of the scale was dead, but we do not propose to pay for any more apple trees from Ontario or anywhere else with scale on them, dead or alive. The "blessing" will have to be disguised more carefully in the future before it will pass current here. The "three large nurseries that furnished ninty-eight per cent. of the stock planted in Nova Scotia," must get busy and clean up the stuff before any more of it comes this way. We want the trees, and are willing to pay the price, but we do not want any "blessings" thrown in. While they are cleaning up we will mark time and take stock, incidentally doing a little in the nursery business on our own account.

Early in 1912, while pursuing Brown Tail Moth, Mr. Saunders found live San Jose Scale on apple trees brought from Ontario in 1911. One blessing—not in disguise—we have in Nova Scotia is a live Secretary of Agriculture. There was something doing in horticultural lines almost immediately Secretary Cumming soon had a good staff at work running down the trees planted in 1911. The inspectors soon found that 1910 plantings were also infested, and 1912 plantings were "lousy."

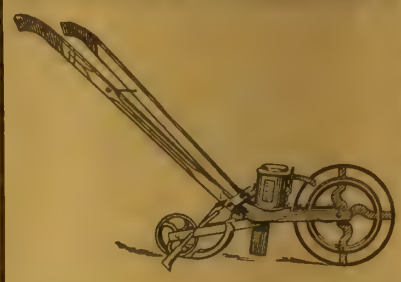
As fast as competent men could be obtained they were put into the field, and spent the summer in hard work. The net results were eight hundred and fifty trees found infested with live scale, torn out and burned root and branch. Mr. Saunders, who has had charge of the field operations, is sanguine that in two or three years the scale can be exterminated, and every fruit grower is willing and anxious to give him a chance to try.

The Provincial Government, on petition of the Fruit Growers' Association, took power last session to control the San Jose Scale and other insect pests.

The Order in Council, as promulgated on October 25, 1912, provides that all nursery stock coming into the Province shall pass through either Digby or Truro as ports of entry, and no imported nursery stock will be delivered to any importer or consignee within the Province of Nova Scotia unless the same is accompanied by a certificate signed by the Provincial Entomologist or other authorized Government officer, that the nursery or other premises on which the same was grown was inspected between the fifteenth day of June and fifteenth day of September next preceding the shipment thereof, and that said nursery or other premises were found to be apparently free from San Jose Scale.

The Regulations as promulgated are drastic and will mean prohibition to trees from Ontario during the coming season at least.—S. C. Parker, President N. S. F. G. A., Berwick, N. S., in Canadian Horticulturist.

GARDEN SEEDERS



Our **seeder** has years of success behind it and with improvements recently added, makes it without a doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. **The flow of seed** can be instantly stopped by a **swinging cut-off** operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. **The covering wheel** is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. **The main wheel** is high with a wide rim which keeps it from sinking into the soft earth.

Each year finds the demand for our garden seeders greatly increased. No better **seeder** can be built for accurate and fast sowing of **turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn** and all other kinds of **garden seed.**

Every machine carries our **absolute guarantee.**

Manufactured by

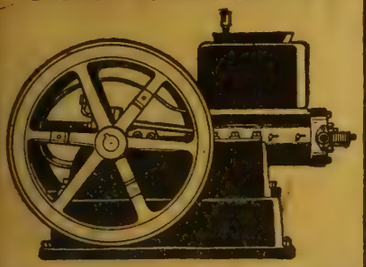
The Sussex Manufacturing Co., Ltd.

SUSSEX, N. B.

Electric Restorer for Men

Phosphonol restores every nerve in the body to its proper tension; restores vim and vitality. Premature decay and all sexual weakness averted at once. **Phosphonol** will make you a new man. Price $3 a box, or two for $5. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

GILSON ENGINE "GOES LIKE SIXTY"



Anybody can operate the simple "GOES LIKE SIXTY" Engine. Ready for work the moment you get it. Built strong and solid to last a lifetime. Will give long, unfailing satisfaction. Gas, gasoline or kerosene can be used for fuel.

Gilson quality gives full value for your money—dependable service, great durability, highest economy and perfect satisfaction; freedom from trouble, delays and expense.

Every engine ABSOLUTELY GUARANTEED. You can try this engine on your own farm before settling for it. You take no chances.

The "GOES LIKE SIXTY" Line has an engine for every purpose. All styles and sizes from 1 to 40 h.p.

Write for catalogue

GILSON MANUFACTURING CO., LIMITED
57 York Street, GUELPH, ONT.

SPRAYERS

For large or small orchards, market gardens, potato farms, grain, mustard, tobacco, home and garden work, poultry plants, whitewashing, cleaning, cold water painting, etc. From *Bucket, Knapsack* and *Barrel Sprayers* to *Traction* and 50, 100, 150 and 250 gallon *Power Sprayers*—complete or in parts to build up. Sprayers already in use. 40 combinations.

$4 to $400 (Now made in Canada)

They have outside pumps, no corrosion, Unit sprayers, so you can build bigger when necessary. Ask your dealer to show them and write for new booklet, "*Spraying Vines, Trees* and *Bushes*." We also make full line potato machines, garden tools, etc.

IRON AGE

The Bateman-Wilkinson Co Limited
434 Symington Ave., Toronto, Ontario

FERRY'S SEEDS

Market gardeners and large planters everywhere place absolute confidence in Ferry's seeds. Professionals make their profits by knowing where to put their trust. Ferry's vegetable and flower seeds have averaged best for half a century. They are pure and they are vital. For sale everywhere.

1913 Catalogue free on application.

D. M. Ferry & Co., Windsor, Ont.

Butter Parchment

Write us about our co-operative scheme.

We can save you just half of the money you pay now and remember we sell nothing but Pure Parchment.

The Maritime Pub. Co., Ltd.
Direct Parchment Importers, Sussex, N. B.

Many sufferers from rheumatism have been surprised and delighted with the prompt relief afforded by applying Chamberlain's Liniment. Not one case of rheumatism in ten requires any internal treatment whatever. This liniment is for sale by all dealers.

Dr. de Van's Female Pills

A reliable French regulator; never fails. These pills are exceedingly powerful in regulating the generative portion of the female system. Refuse all cheap imitations. **Dr. de Van's** are sold at $5 a box, or three for $10. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

N. B. F. G. A. President's Address.

Officers and members of the Fruit Growers' Association—

Gentlemen:

I am glad to welcome you to another annual meeting of the Association.

Before dealing with other matters, I wish to say a word in reference to a familiar face which will be missed from our future sessions. I refer to the late J. C. Gilman, who passed from the active affairs of this life on March 1st. Mr. Gilman was one of the pioneers of this Association. He was elected president at the organization of the Association in 1904 and held the office for several years. One of the most extensive and most progressive orchardists in the Province, his advice was often sought by others younger in the business and was cheerfully given at all times. His influence for good survives him, and I feel that we may all be the better for the good example he set us. On behalf of the Association I sent a letter of condolence to Mrs. Gilman, and filed a copy of the same with the Secretary of the Association.

As to our business of fruit growing, the past year has not been one of the most prosperous. While in some parts of the province the crop of small fruits and of apples were fairly good, the weather conditions generally were against us. This resulted in incomplete fertilization of the blossoms and a consequent small set of fruit, much of which was inferior in quality, and later in much fungus growth which was not wholly controlled by spraying, although as is usual the fruit which was carefully sprayed showed to great advantage over that which was not so cared for.

The concensus of opinion among the members of the Fruit Growers' Association, obtained by the Secretary, was against the holding of an Exhibition last year, and the Department of Agriculture in the absence of the exhibition, made exhibits of fruit in different sections, which attracted much attention, and gave a good advertisement to the fruit growing capabilities of the province.

I am glad to be able to report to you that the setting of new orchards is steadily increasing. Last year the Association through its Secretary, handled 15,000 trees which were distributed to members at cost, at a large saving of money to the members, and an assurance to them of good stock, correctly named. This, and the providing of spraying materials, have been important points in the Association's work.

There is no doubt that the education stimulated by the Association, and the interest awakened by its meetings and exhibits is bearing fruit, and we may hope soon to see New Brunswick ranking where it belongs, as one of the important fruit growing sections of the Dominion.

The Executive has prepared amendments to the Constitution and Bye-Laws which will be submitted to this meeting for approval.

I hope that the Association will also arrange for the holding of an exhibition in the Fall of this year. These exhibitions serve the double purpose of advertising the advantages of our Province for the fruit industry, and of interesting our farmers in this special line of work, which I believe is the most profitable in which they can engage.

Respectfully submitted,
(sgd) C. N. Vroom,
President.

Fredericton, N. B., Feb. 18, 1913.

Mature your crop early

HOW?

The market gardener gets the top of the market for early produce, and the general farmer saves many dollars from early frosts by using a **soluble,** high-grade complete fertilizer, like one of our Stockbridge manures. There is no mystery about it. A crop, like a calf, will grow quicker and healthier on a full ration, **but the ration must be right.** The

Stockbridge Manures

offer this sort of ration for crops.

The Stockbridge Manures were formulated by the late Professor Stockbridge of the Massachusetts Agricultural College and were introduced forty years ago. They have been improved and kept up-to-date. The Stockbridge and all the other Bowker brands are soluble, active, sure. They are made from the best materials by special factory methods. Prompt service and moderate prices go with them.

We want Agents in unoccupied territory. Write today for prices and terms; this may mean a good business for you if your act at once.

Write anyway for our illustrated catalogue and calendar. We want you to know what we can do before you buy your spring fertilizer.

BOWKER FERTILIZER COMPANY

76 Lyman Street, Buffalo, N. Y. 42 Chatham Street, Boston, Mass.

Original and largest manufacturers of special fertilizers.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, **free** of any charge, my **home treatment** with full instructions to any sufferer from women's ailments. I want to tell **all** women about this cure — **you,** my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men **cannot** understand women's sufferings. What we women know **from experience,** we know better than any doctor. **I know** that my home treatment is a safe and sure cure for **Leucorrhoea** or **Whitish discharges, Ulceration, Displacement** or **Falling** of the **Womb, Profuse, Scanty** or **Painful Periods, Uterine** or **Ovarian Tumors** or **Growths,** also **pains in the head; back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar** to our sex.

I want to send you a **complete 10 days' treatment entirely free** to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that **it will cost you nothing** to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week, or less than two cents a day. It will not interfere with your work or occupation. **Just send me your name and address,** tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you **free of cost,** my book—"**WOMAN'S OWN MEDICAL ADVISER**" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to **think for herself.** Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures **all, old or young.** To **Mothers** or **Daughters,** I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this **Home Treatment** really **cures** all woman's diseases and makes women well, strong, plump and robust. **Just send me your address,** and the free ten days' treatment is yours, also the **book.** Write to-day, as you may not see this offer again. DAIRYING.

Marketing Dairy Produce.

Mr. Chairman and Gentlemen:

I feel somewhat out of place with my short experience in the dairy business in attempting to say anything on the subject assigned me, namely, The Marketing of Dairy Produce, especially when I see before me men who have spent their lives in the business.

I will attempt to give you in as few words as possible some of the things which have impressed me most and some of the difficulties we have met during the past years work, hoping that an exchange of experiences and ideas may benefit us all. Marketing butter, I say butter for that is the main product of our dairies and the one we are most interested in, is the most vital part of the creamery business. As soon as a locality is capable of producing more butter than the local market can consume a creamery becomes a necessity and is required to manufacture a uniform article which can be shipped readily.

We have entered upon a period when there will be a large increase in the dairy industry in the Province. The management of the factory that undertakes to market the output of one or three hundred farmers assumes a large responsibility and as the business increases must come an increase in efficiency and usefulness.

Young men are not likely to connect themselves with business or older farmers to increase their herds if it does not hold out fair financial inducements. The interests of the dairy farmer and the creamery which he patronizes are one and they should join hands in endeavoring to put out the best article and manufacture at as small a cost as possible with the idea of being fair to the producer and fair to the consumer.

One of the difficulties we have met is the lack of definite information regarding market prices of butter in the Province and unreliability of the newspaper quotations as compared with what the factories were receiving. I recall a couple of instances for illustration. At one time during the summer, we were getting the highest prices quoted by the Montreal and St. John markets and we were tola by the wholesale firms we were dealing with that they were getting butter from a certain creamery one cent per lb. less. That particular creamery not only might have been getting more themselves but had a tendency to prevent us from getting the market price.

At another time we were receiving the highest price quoted, Mr. MacKay came down and told us that we were selling less than some of the other factories of the Province. Of course, that was a loss to us and may have been a hindrance to others.

Right here I would like to make a suggestion for consideration. Would it be practical for every creamery to report in the strictest confidence, of course, to Mr. MacKay, or some other person who might be chosen, once each week that they were getting for butter and have him strike an average of these and report to each creamery together with the latest market reports. This would form a basis of information to each manager and would be particularly valuable to younger creameries and would not be divulging the secrets of any company.

Another and probably the most serious problem we had to meet in marketing our butter was the lack of a refrigerator car service. There seems to be an almost unlimited demand for print butter in Cape Breton but it is a five days' trip by frieght from Yarmouth to Sydney and two days from Yarmouth to Halifax. The distance makes it impossible to use the tray system of package on account of the returning of the empties. Prints packed in sixty lb. boxes which the market requires, no matter how well hardened before starting, if closed in a box car for five days in warm weather are badly defaced as well as reduced in quality and marketing value. If it were possible to get the service of a refrigerator car once a week we could harden our prints twenty-four hours before packing and remove them from the refrigerator to the iced car, we would have a system better than the tray system and much cheaper. lb

Any decrease in price which is due to defects in transit is a dead economic loss by which no man profits and in the end the farming community must bear the expense. If we estimate this at one-half cent per lb., that on our make alone during the past ten months would amount to $330.00. Between Yarmouth town and Halifax there are five creameries and one car could pick up the output of each week by making regular weekly trips. I am not so well acquainted with the other parts of the Province, but no doubt similar system could be worked out.

I will advance one more suggestion for discussion and I am done.

The creameries seem to be too far removed from the consumer. There is from 10 to 12 cents per lb. between the price which the farmer receives for the butter in their cream and that which the consumer pays.

The creameries are receiving only 25 per cent. to 30 per cent. of this for collecting the cream and all the expense of material and labor of manufacturing and selling. The other 75 per cent. is consumed between factory and consumer. Who gets it? —A paper read by F. E. Porter, Yarmouth, before the Convention of Nova Scotia Dairymen, at Truro, Jan. 10th, 1913.

The Vitality of Dairy Cows.

The vital function in dairy cows is one of reproduction. We have developed and intensified the correlated function of milk production in the dairy cow until she has taken on what I like to term, a motherly makeup, type, or conformation which is indicative of great milk production. It is this function that gives our animals the power they have of making the great milk records they do.

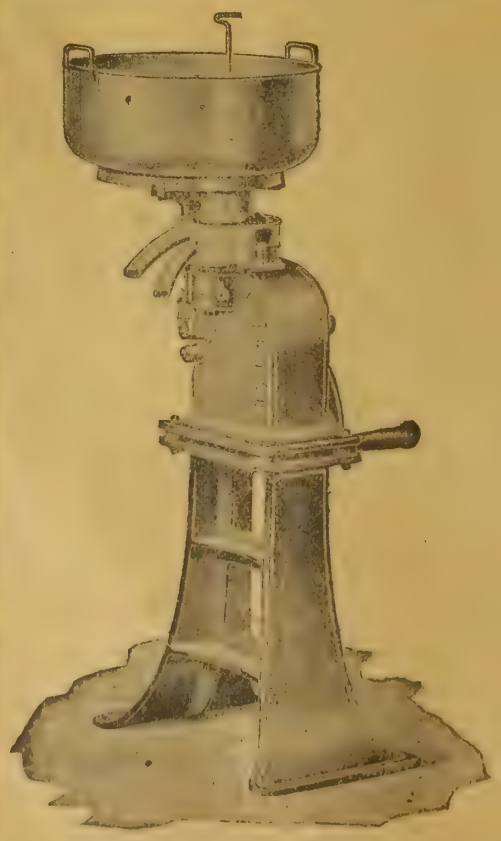
Now the question, and it is one of deep study, is, have we in a measure developed the function of milk production at the expense of that of reproduction? Some say, truly, that two functions in a living thing can't be developed to their highest state without a sacrifice of the one or the other. I like the view though that these functions are so closely correlated that they are one function, not two distinct functions. Milk production is the greatest result of reproduction. We can develop the both to a very high state in the same animal and not at a sacrifice to either. This is a vital problem. Seemingly we have neglected the study of the reproductive function for we are having epidemics in many herds that ought not to occur.

These epidemics are a serious thing to the industry of dairying not only in the loss of vitality of the dairy animals but also in the income of the dairyman where the epidemic occurs. Contagious abortion, failure to breed and the like ought to be under control. A closer study of the reproductive organs of the dairy cow, the performance of their function, the diseases of the same, their development, in brief, a closer insight into our dairy animals is before us. It must be made.

Is it policy to have our cows freshen once a year? Thousands of cows are bred when their reproductive organs are not in a vital condition to commence their function or reproduction again. The average dairyman breeds his dairy animal about as soon as she comes in heat the first time, after she has reproduced, regardless of the condition she is in. They should be bred when they begin to take on marks of vitality. The keen perceptive dairyman can tell when the vitality marke begin to show. Your animals should be as strong at the beginning as at the end of service. You should feed and handle your animals with the idea that they are growing offspring as well as producing milk. As the time of birth of the young draws near the blood that went to be transformed into milk goes to develop the foetus. You should drive the blood if possible from the udder to the foetus two months before birth so that the maternal organs will be strengthened and the foetus developed to the very best. The longer you milk an animal up toward the birth period the more you are sapping her vitality.

At this time such rich energy foods should be fed rather than oat straw, those foods that will incite the maternal organs and give them the most healthful development. We should be very particular about the vitality and healthful condition of our dairy mother to be. The stronger, the better condition that we can get her in at this time, the stronger and lustier will be the offspring and the incentive to a great milk production. She will have strength to calve easily and

DIABOLO CREAM SEPARATOR



Built in Sweden by the world's largest Cream Separator makers

The Diabolo Separator is sold more exclusively throughout foreign countries than any other machine, and has a world wide reputation for the excellent quality of its work. It is very ***light running*** and ***easy to handle,*** and on account of its simple construction the cost of repairs is practically nothing. In introducing the Diabolo Separator to the trade, we are offering you a machine that has ***no superior,*** at a price that never before was attempted on a first class Separator.

We can positively guarantee that there is no Separator on the market,

That skims closer; That is eas er to turn;

That is made of better material in every detail;

That costs less for repairs;

That gives you the quality at our price.

PRICES:—**300 lbs.** - **$35.00**

in an hour or so she will deliver herself of her afterbirth. Then this wonderful function of milk production begins. We should develop it to the very highest possible extent. At this time the heifer should be milked every six hours for at least two months. It is wonderful to see what a motherly and milk producing young heifer you can make by this method of handling and liberally feeding. You will be gladly surprised at the way this motherly function is excited, and the way the vitality of the dairy mother is kept up. Not only are the owners of pure-bred stock who officially test each animal as it freshens but also in this great dairy section, the owners of high grades are beginning to milk their best cows four times a day. They are hiring extra men so that they can do it. They are handling their herds in this best possible manner.

It has become a recognized fact that to keep the dairy cow in the best possible condition she must be liberally fed the year through. It is essential in times of drought when animals are pastured that supplemental feeds as soiling crops and the like be on hand and where we dairymen feed so much grain it is necessary that our animals be fed a little grain the whole year to keep them up in the best possible condition. If we do this our animals will be in a vital condition. We will have very little trouble with the dreaded diseases that are a scourge to the dairyman. Our net profits will be higher for our dairy animals will be in condition the year through to render us the best they can. "Vitality" will be the keynote that makes us successful dairymen.—Harry Mason Knox.

MORE POTATOES PER ACRE

Think of finding one to eleven $5 bills in the furrow, on every acre you plant. It's been done many times. Plant the spaces you skip, sell the potatoes, and you've got the money. No extra land, no extra work, it costs no more to prepare ground, fertilize, cultivate, spray and dig a perfect stand

IRON AGE (Improved Robbins) Potato Planter (Now made in Canada)

This machine soon pays for itself and yet puts real money into your pocket. One seed piece in every space and one only. Uniform spacing. No injury to seed. Ask your dealer to show it and write us for free booklet, "*100 per cent Potato Planting.*" We make full line Potato machines, Garden tools.

The Bateman-Wilkinson Co., Limited 438 Symington Ave. Toronto Ontario

Trials of Milking Machines.

Trials of milking machines, arranged by the Royal Agricultural Society, will be held in the county of Durham, England, in April or May, 1913. The exact place and date have not yet be fixed. It is required that the machines presented at the show should be capable of milking at least two cows at a time. In the award special account will be taken of the following accounts: (a) Time taken in milking. (b) Weight of milk exclusive of strippings. (c) Convenience in attachment to the cows, taking into account ease of replacing where the machines has become detached from any cause. (d) Security of attachment to teats. (e) Gentleness of operation. (f) Ease in regulating speed of machine. (g) Condition of milk. (h) Ease and thoroughness of cleansing. (i) Lightness of milk receptacles. (j) Minimum of supervision during milking, so that man in charge can leave cows to carry milk away to the dairy, &c. (k) Price of machine with cheapness of renewal and durability of working parts.

Buy a Good Sire.

It has been demonstrated again and again that the cheapest investment that can be made by a farmer who is trying to build up the standard of a herd of cattle lies in the purchase of a godd purebred bull. It is not necessary to buy several high-priced females as a basis for the average herd, nor is it economical. The most economical results can be obtained by buying a bull with masculinity enough behind his good breeding to stamp his likeness upon the calves secured.

A striking proof of this has been shown on the cattle show circuit at various state fairs this fall. One of the many instances will suffice. Recently a prominent state fair judge had to choose between two cows with the same dam, but sired by different bulls, for the female championship of the breed. So strikingly similar in type was each of them to its own sire, though the dam was the same, that there was no trouble in distinguishing between the two. The one that had been produced by the more outstanding sire was so superior to the one that had been produced by the less superior bull that there was no trouble about the selection.

The principle illustrated is of practical value to the farmer who is thinking of beginning a herd with limited capital, or who has a very common herd that he desires to grade up. An average group of calves will be far superior to their commonly-bred mothers if a good purebred bull is used. Such a bull can be purchased very reasonably if proper care is taken by the purchaser.—Ray P. Speer, Minnesota College of Agriculture.

Dairy Strippings.

There's prosperity for the farmer who gets rid of his scrub cows and replaces them with a good dairy breed; there's hope for the farmer who keeps his common stock but tries to make the most of them by adopting newer and better dairy practice; but for the farmer who obstinately sticks to his scrub cow and scrubber ways, there's—well, "Raus mit him!"

* * * *

The good dairyman believes in the gospel of the "little thing." Close attentihn to "trifles" makes a dairy profitable; but a profitable dairy is no trifle.

Your Soil Is Alive

TO all intents and purposes, soil is alive. It breathes, works, rests; it drinks, and, most important of all, it feeds. It responds to good or bad treatment. It pays its debts, and pays with interest many times compounded. Being alive, to work it must be fed. During the non-growing seasons certain chemical changes take place which make the fertility in the soil available for the next season's crop. But this process adds no plant food to the soil. Unless plant food is added to soil on which crops are grown, unless the soil is fed, in time it starves. There is one best way to feed your soil. Stable manure, which contains all the essentials of plant life, should be spread evenly and in the proper quantity with an

I H C Manure Spreader

I H C manure spreaders—**Corn King or Cloverleaf**—are made in all styles and sizes. Sizes run from small, narrow machines for orchard and vineyard spreading, to machines of capacity for large farms. The rear axle is placed well under the box, where it carries over 70 per cent of the load, insuring plenty of tractive power at all times. Beaters are of large diameter to prevent winding. The teeth that cut and pulverize the manure are square and chisel pointed. The apron drive controls the load, insuring even spreading whether the machine is working up or down hill, or on the level. I H C spreaders have a rear axle differential, enabling them to spread evenly when turning corners.

The I H C local agent will show you all their good points, and will help you decide on the one that will do your work best. Get literature and full information from him, or, write the nearest branch house.

LIVE STOCK.

Amended Regulations in Regard to the Free Entry of Animals for the Improvement of Stock, in Effect 1st. April, 1913.

Memo. No. 1522 B. of 27th January, 1909, is cancelled and the following Regulations and Instructions in the above matter are prescribed and in effect from 1st April, 1913:—

REGULATIONS.

1. No animal imported for the improvement of stock shall be admitted free of duty unless the owner is a British subject, resident in the British Empire, or if more than one owner, each is a British subject, resident in the British Empire and there is furnished an import certificate stating that the animal is recorded in a Canadian National Record or in a Foreign Record recognized as reliable by the National Record Committee.

A statutory Declaration by the owner or one of the owners, that he is a British subject, or that each is a British subject, resident in the British Empire and that such animal is the identical animal described in such certificate must be provided, and that such animal is being imported into Canada for the improvement of stock.

2. In case such certificate is not at hand at the time of the arrival of the animals, entry for duty may be accepted subject to the refund of the duty upon the production of the requisite certificates and proofs in due form satisfactory to the collector within one year from the time of entry.

3. The form of certificate to be accepted for the free importation of animals for the improvement of stock and the Customs procedure in connection therewith shall be subject to the direction of the Minister of Customs.

4. The above declaration shall be attached to the Free Import Entry and may be made before the Collector, Sub-Collector, Surveyor or Chief Clerk at the port where the goods are entered or before any functionary authorized by law to administer oaths.

INSTRUCTIONS.

(a) Import Certificates required are those bearing the signature of the Accountant of the Canadian National Records, for horses, cattle, sheep, goats, asses and swine (but not including the Holstein-Friesian cattle). Import certificates required for Holstein-Friesian cattle are those bearing the signature of the Secretary of the Holstein-Friesian Association of Canada.

(b) The Import Certificate and declaration to be delivered to the Collector of Customs before free entry of animals is allowed, shall be in one of the forms in the schedule hereto.

(c) The Import Certificate for horses shall specify the colour and natural markings, if any, if there are no markings the word "solid" shall be inserted: The Collector of Customs is required to compare the description given on the Import Certificates with the animal and if the colour and markings do not agree, free etry must be refused and duty collected.

(d) The Import Certificate shall be attached to the free Customs entry for transmission by the Collector to the Department of Customs, Ottawa.

The said certificate shall be marked in each case with the Customs entry number and the office dating stamp.

The Collector of Customs shall not demand or accept any certificate as to pedigree, other than in one of the "Import Certificates" forms herein prescribed and the Declaration of Ownership.

(e) Animals may be shipped in bond from the Canadian Frontier port to the Customs port of destination, subject to Quarantine Requirements.

(f) Import certificates for Holstein Friesian cattle are issued by the Secretary of the Holstein-Friesian Association of Canada, St. George, Ont.

(g) Import certificates for Live Stock other than Holstein-Friesian cattle may be procured on application to "Accountant" Canadian National Records, Ottawa, from whom there may also be obtained a list of Canadian Records and other information concerning the importation of pure bred animals for the improvement of stock.

(sgd) John McDougall,
Commissioner of Customs.

Mailed to outports.

Removal of Afterbirth.

Editor Maritime Farmer'

A few years ago I read in the paper something to remove the afterbirth from a cow. I think it was in your valuable paper; if not, perhaps you can give the information I wish. As I remember it, it was to use some quantity of iron in water and inject into the womb. If you can give me this information, or something better, you will oblige me very much.—J. B. M.

We do not find recommended any vaginal injections for the purpose of bringing away the retained placenta or afterbirth in a cow. Have also talked with some men who ought to know if such a method is anywhere used, none of whom have ever heard of it. Some of the works on veterinary obstetrics make mention of some emmenagogues, to be administered by the mouth, but the best method accepted by reliable stockmen seems to be simply to keep the cow in a good laxative condition, and if the afterbirth does not come away in twenty-four hours, to remove it by hand, being extremely careful not to rupture any of the other membranes in so doing. When retention is caused by drinking iced water or frozen food, the giving of hot drinks, hot mashes of wheat bran, or other laxative foods ought to be sufficient. If more of a laxative is needed, a pound and a half of Glauber salts in four quarts of water, an ounce of ginger in a quart of sweet oil, or a bottle or two of flaxseed tea, are good doses.

The removal of an afterbirth which has been retained more than twenty-four hours will be somewhat disagreeable and dangerous on account of the decomposition which will have commenced. If the trouble is of some days' standing, as occasionally happens with the cow, we would think the advice of a veterinary quite essential.

Not Always a Good One.

A pure-bred pig is not always a good one. This is because pigs are not always pure bred and because inferior specimens are always found in all kinds of breeds. The parent stock may be properly mated, may be bred on the wrong principles, or may be produced from stock that has been bred according to wrong ideals; ideals that are not conducive to the production of the best kind of a market animal. Where these conditions exist it is true improvement may be made by cross breeding, but this may also be done by good pure breeding. —W. D.

This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

* * * *

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

* * * *

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

* * * *

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough—that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

* * * *

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

THE HORSE.

Wart and Lump on Filly's Shoulder.

Would you kindly tell me the best way to remove and prevent small lumps, like pimples, on a filly? They are situated down along the shoulder just where the collar would rest—four in number. She had similar small lumps on her shoulder last summer, which became sore from the pressure of the collar, when for reasons not necessary to explain, I turned her out to grass, when after a while several more appeared, scattered about in the region of the humerus. On the approach of winter they went away, but are reappearing now in a different place. She was fed with good hay morning and night, just what she would clean up, in the stable last winter, with a run out to a bare pasture most part of each day but had no grain for the last twelve months, and very little previous. She has been at grass the last four weeks, and is improving in condition every day. It may be due to fulness of blood, as the dam had a scruff on the back of her neck from that cause every summer until she was about twelve years old, although working constantly on the farm. The filly is well bred, five years old, about 14 hands 3 in. high, and in good condition now. There is also what appears to be a wart on her neck, near the others, about the eize and shape of half a vetch seed.—F. W.

Answer: The small lumps like pimples are probably what is popularly known as surfeit, a condition not uncommon in the spring, and associated with changing of the coat or with indigestion. Fulness of blood is often only another name for stomach disturbance. Unless, in your case, friction from the harness causes soreness, the pimples or eruptions rarely occasion much inconvenience. Very often they remain only a few days, the cuticle peels off, and a small scaly spot is left. Sometimes, however, the eruption assumes a more virulent form, and it is desirable to give a dose of physic and a change of diet. The usual method of treatment is to give a few doses of alterative medicine. An example is 2 oz. each of sublimed sulphur, black antimony, nitrate of potash, and powered fenugreek. Mix, store in a covered tin, and give a tablespoon every night in damped food—crushed oats, bran and chaff. With reference to the wart, apparently it is of a shape and size that precludes the possibility of tying a ligature round it, and the most effctive treatment will be excision. With such a small excrescence and not in the way, we should be inclined to leave it until it grows larger, especially as it may disappear spontaneously.

Standard Bred Horse Association.

Members of the Canadian Standard Bred Horse Association decided at their annual meetingly recently to organize a national troting and pacing association similar to the American Trotting Association and the National Trotting Association to control racing in Canada. A committee consisting of Messrs. O. B. Shephard, and George Pepper, of Toronto, and James Cowan, of Cannington, was appointed to bring about the organization and incorporation of the Association. The decision is regarded by horsemen as one of the most important events that has happened for many years in the interest of the standard bred horse.

It is now the intention of the new association to become a money making concern. All money from racing, membership fees, etc., after paying the legitimate expenses of conducting the Association, are to be used to advance the interests of the standard bred horse in both breeding and racing. Another important matter was dealt with. The government is bouncing owners of the thoroughbred stallions, who, for nominal figure, place their horses at the disposal of farmers in certain districts, and the standard breed men, feel that the same might be done for them, claiming that there is no better cross for remounts, than the Thoroughbred, crossed with the Standard bred.

All the growth and thrift that can be encouraged and maintained during the first year of a colt's life insure a stronger and a better horse.

Lump on the Hock Joint.

A. C. F. I have a four-year-old horse with a hard lump on his hock joint. I do not know, for sure, if it is a spavin. Could you, in your paper, The Maritime Farmer, let me know of some remedy for it? He mired down in the mud and floundered around; next day it swelled up and I doctored with spavin cure and it got soft after two weeks' treatment, so I could press on it with my fingers, and it would take the shape of my fingers for a while; then it grew hard again. He does not limp and it does not seem to affect him at all.

Answer—If this animal is not lame there is no necessity of much treatment. It is likely that the enlargement can be reduced somewhat by blistering. Rub a cantharides blister in well at night and wash off in the morning, then keep greased so that the skin will not get too dry. While the blister is on the animal its head should be tied so that he cannot get his mouth to it.

Splints.

During the development of splint, when the exostosis is forming there is sometimes lameness of a severe character, caused by the painful stretching of the membrane covering the bone; but when the periosteum has accommodated itself to the presence of the enlargement, the lameness ceases, and, the inflammatory stage being past, it rarely recurs. There are, however, thousands of cases of splint to be met with in which the animal never shows sign of lameness for a single day.

Thus the treatment of splint depends entirely on circumstances—mainly on its stage of development and whether or not lameness is present. Age has a great influence, and if the horse is young, or the splint developed at pasture, or has been in existence for some time, there is rarely any lameness, and the question is one of letting it alone or trying to remove the eyesore or blemish. It is difficult to persuade the owner to let it alone, more particularly if he thinks some day of selling the animal, because, as he expresses it, he fears—and perhaps not without reason—that it will "go against him." The wisdom of interfering with a fully-formed splint when the irritation and inflammation attending its growth have passed away, and the horse is going sound again, or in those cases in which there has been no lameness during its formation, is

Horsemen Attention!

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and pr eserve the life of your horses. heir use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Glanders, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Troubl, Fevers, Cuts, Sores and will remove bunches of all kinds.

very doubtful.

Leaving for the moment the case of the simple splint without lameness, let us suppose a case where the formation is recent and the lameness excessive. Young horses straight from grass, or brought from country work, and put to labor on hard or paved roads in towns, very often fall lame with splint, and the better their action the greater the liability and the more severe the lameness. The shock of concussion is greater. There is in this class of case the inflammatory stage to be treated, and here a grave mistake is often made in applying stimulants. Blisters, embrocations, liniments, of "oils" should never be applied until the inflammation has been abated, or has passed away as the result of time and rest. At this stage rest is imperative, not only because to use a lame horse is cruelty, and the owner risks a prosecution, but for the more speedy restoration to usefulness. Work during the stage of inflammation and lameness, or too soon after the lameness has disappeared, prolongs it or causes it to recur. We have known many cases where rest and cold water irrigation, followed by further rest at grass, has proved equal to the cure of splint lameness, without any other treatment. A dose of physic proportionate to the size of the animal is decidedly useful as a preliminary to treatment by rest and cooling lotions. Examples of refrigerating and sedative lotions are' (1) Hydrachlorate of ammonia, 2 drachms; acetic acid, 2 oz.; methylated spirit, 4 oz.; water 1 quart. (2) Acetate of lead, ½ oz.; acetic acid, 2 oz.; tincture of arnica, 4 oz.; rain or distilled water, 1 quart. Apply on linen bandages. When the inflammation has been reduced, as shown by there being less heat in the part and less pain on pressure or movement, is quite time enough to think about blistering, setoning, subcutaneous periostiotomy, or firing, and none of these are recommended unless the lameness persists, and permanent lameness from splint per se is rare. If a blister is thought desirable, the most useful form of vesicant for any bony enlargement is biniodide of mercury ointment of a strength of 1 to 7 of lard or lanoline. Where, as commonly happens, the owner is not content to "wait and see," but feels he must, as he expresses it, "do something at it," or try to "take off" the splint, the least hurtful, and likely to be the most successful, is the prolonged use of iodine. Where there is a splint from which the animal is not lame, and therefore being capable of being kept at work, the best way to use iodine is in the form of an ointment made by mixing together 1 drachm of resublimed iodine and 1 scruple of iodide of potassium with a few drops of spirit of wine and 7 drachms of benzoated lard. Shave the hair closely from over the enlargement, and—twice a week for the first week, and once a week subsequently—rub in a piece of the size of a small hazel nut. Immediate results, if any, must not be expected, and the application must be continued for some time. Iodine is, however, a capital absorbent, does not blister if judiciously used, and therefore does not interfere with the animal being worked.

Horses in Winter.

Professor J. H. Shepperd, of the North Dakota Agricultural College, answering a question recently about wintering horses on straw, says:

The North Dakota Station did a considerable amount of work in horse feeding a number of years ago and made extensive trails with oat straw, as compared with hay, for roughage. In the trial it was found that some horses did about as well on it as they did on hay. While others were very much harder to carry, chiefly because their appetites for roughage were too light to cause them to eat enough of it. Aside from those dainty animals there was little trouble in keeping them up on oat straw as roughage.

The oat straw used was that of a normal season, which was coarser and more woody than that which had been obtained this year. The trial consisted of a period of sixty days' feeding with oats as the grain ration against a similar period with oats and hay, and sixty days' feeding with a mixture of half and half bran and shorts by weight with hay compared with sixty days' feeding bran and shorts with oat straw.

During the first thirty days winter conditions were present and the horses were used only about enough for good exercise. During the second thirty days they were worked at harrowing, discing and seeding and had nearly all of that work the last half of the month. The horses receiving oats and hay as a ration required nine and one-third pounds of oats with hay to carry them, while those on oats and straw consumed eleven and one-half pounds of oats per day. During the thirty days that they had light work, the horses on hay gained 176 pounds and the three on straw 169 pounds. During the thirty days when they had heavy work one-half of the time, those on the hay lost 340 pounds and those on straw 345 pounds.

The similar lot of horses fed on bran and shorts, half and half by weight, gained during the winter conditions, 88 pounds when fed hay, and 83 pounds when fed strgw. When they were on the straw ration with heavy work for one-half of the month they lost 225 pounds, and on the hay ration 235 pounds.

These results indicate that horses can be carried almost as successfully on straw as roughage as they can on hay, provided enough additional grain is given them to supply them with sufficient nourishment. The additional grain required is about one-fifth. If the feeder has facilities for chaffing the straw and will moisten it and mix the grain fed with it during the season when the animals are required to do very little work, a smaller amount of grain will carry them.

Warranted to Give Satisfaction.

Gombault's
Caustic Balsam

Has Imitators But No Competitors.

Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

FREE-FARM ACCOUNT BOOK

Bickmore's Farm Account Book will be sent free to any farmer who will tell us who and where he is. This book is arranged to keep all accounts in simple form—more simple and certainly more practical than trying to remember them; shows what to charge against crop production; has a laborers' time record; and section for personal accounts. **64 pages, for ink or pencil.** Not a cheap affair. Its quality is in keeping with **BICKMORE'S** Gall Cure, a soothing, healing salve, the old-time reliable horse remedy. Horses are now too valuable and too high priced to take chances of losing their services. **Bickmore's** Gall Cure heals and cures **Harness and Saddle Galls; Rope Burn, Cuts, Scratches, Grease Heel, etc.** You don't have to lay the horse off. **Bickmore's cures while the horse works.** Great thing for sore teats in cows. The work-horse trade mark on every box. None genuine without it. Be sure to ask for **Bickmore's** Gall Cure when you go to buy and do not take a substitute. Farm Account Book is ready. Send today.

In-Foal Mares INSURANCE

OF ALL the losses owners are liable to, none can be **less prevented or modified** in any manner whatsoever **than loss by foaling.** Notwithstanding the best care and attention, although a mare **may have foaled** many times successfully, she is always a cause of worry and anxiety to the owner through the fear of **losing by death** the often very **high cash value of the Beast,** not to mention service fee, care and expenses incurred for no avail. **Why risk such loss** when a payment of a few dollars in premiums would **cover you** should it happen. Reduce the amount **of the RISK** by insuring, only risking thereby the **loss of the Premium** if the mare foals allright. We issue 30 days, 6 months and 12 months policies with or without cover on foal.

Write for address of nearest agent. All kinds of live stock insurance transacted.

The Wood Cutting Season Is Here

Save money and labor by getting a Sussex Wood Cutter. Manufactured in four different sizes; two Long Swings, Short Swing and Flat Roller Table. Tables of all are built of the best seasoned hardwood, and strongly braced with steel bars. The greatest care is exercised in the making of the iron and steel work. The Balance Wheel is a solid web and weighs 180 lbs., thus allowing it to be operated with a minimum amount of power.

Every machine is inspected and tested before leaving the factory by painstaking and competent men, and is guaranteed for one year against all defects in workmanship and material.

David Copperfield.

By Charles Dickens.

(Continued from last issue.)

Here everybody cried out, "Shame, J. Steesforth! Too bad!" It was Traddles whom Mr. Mell instantly discomfited by bidding him hold his tongue.

—"To insult one who is not fortunate in life, sir, and who never gave you the least offence, and the many reasons for not insulting whom you are old enough and wise enough to understand," said Mr. Mell, with his lip trembling more and more, "you commit a mean and base action. You can sit down or stand up as you please, sir. Copperfield go on."

"Young Copperfield," said Steerforth, coming forward up the room, "stop a bit. I tell you what, Mr. Mell, once for all. When you take the liberty of calling me mean or base, or anything of the sort, you are an impudent beggar. You are always a beggar you know; but when you do that, you are an impudent beggar."

I am not clear whether he was going to strike Mr. Mell, or Mr. Mell was going to strike him, or there was any such intention on either side. I saw a rigidity come upon the whole school, as if they had been turned into stone, and found Mr. Creakle in the midst of us, with Tungay at his side, and Mrs. and Miss Creakle looking in at the door as if they were frightened. Mr.Mell, with his elbows on his desk and his face in his hands, sat, for some moments, quite still.

"Mr. Mell," said Mr. Creakle, shaking him by the arm; and his whisper was so audible now, that Tungay felt it unnecessary to repeat his words; "you have not forgotten yourself, I hope?"

"No, sir, no," returned the master, showing his face, and shaking his head, and rubbing his hands in great agitation. "No, sir, no. I have remembered myself, I—no, Mr. Creakle, I have not forgotten myself, I—I have remembered myself, sir. I—I—could wish you had remembered me a little sooner, Mr. Creakle. It—it—would have been more kind, sir, more just, sir. It would have saved me something, sir."

Mr. Creakle, looking hard at Mr. Mell, put his hand on Tungay's shoulder, and got his feet upon the form close by, and sat upon the desk. After still looking hard at Mr. Mell from his throne, as he shook his head, and rubbed his hands, and remained in the same state of agitation, Mr. Creakle turned to Steerforth, and said:

"Now, sir, as he don't condescend to tell me, what is this?"

Steerforth evaded the question for a little while; looking in scorn and anger on his opponent, and remaining silent. I could not help thinking even in that interval, I remember, what a noble fellow he was in appearance, and how homely and plain Mr. Mell looked opposed to him.

"What did he mean by talking about favorites, then?" said Steerforth, at length.

"Favorites?" repeated Mr. Creakle, with the veins in his forehead swelling quickly. "Who talked about favorites?"

"He did," said Steerforth.

"And pray, what did you mean by that, sir?" demanded Mr. Creakle, turning angrily on his assistant.

"I mean, Mr. Creakle," he returned in a low voice, "as I said; that no pupil had a right to avail himself of his position of favoritism to degrade me."

"To degarde you?" said Mr. Creakle. "My stars! But give me leave to ask you, Mr. What's-your-name;" and here Mr. Crealke folded his arms, cane and all, upon his chest, and made such a knot of his brows that his little eyes were hardly visible below them; "whether, when you talked about favorites you showed proper respect to me? To me, sir," said Mr. Creakle, darting his head at him suddenly, and drawing it back again, "the principle of this establishment, and your employer."

"It was not judicious, sir, I am willing to admit," said Mr. Mell. "I should not have done so, if I had been cool."

Here Steerforth struck in.

"Then he said I was mean, and then he said I was base, and then I called him a beggar. If I had been cool, perhaps I shouldn't have called him a beggar. But Idid, and I am ready to take the consequences of it."

Without considering, perhaps, whether there were any consquences to be taken, I felt quite in a glow at this gallant speech. It made an impression on the boys, too, for there was a low stir among them, though no one spoke a word.

"I am surprised, Steerforth—although your candor does you honor," said Mr. Creakle, "does you honor certainly—I am surprised, Steerforth I must say, that you should attach such an epithet to any person employed and paid in Salem House, sir."

Steerforth gave a short laugh.

"That's not an answer, sir," said Mr. Creakle, "to my remark. I expect more than that from you, Steerforth."

If Mr. Mell looked homely, in my eyes, before the handsome boy, it would be quite impossible to say how homely Mr. Creakle looked.

"Let him deny it," said Steerforth.

Deny that he is a beggar, Steerforth?" cried Mr. Creakle. "Why, where does he go abegging?"

"If he is not a beggar himself, his near relation's one," said Steerforth. "Its all the same."

He glanced at me, and Mr. Mell's hand gently patted me upon the shoulder. I looked up with a flush upon my face, and remorse in my heart, but Mr. Mell's eyes were fixed on Steerforth. He continued to pat me kindly on the shoulder, but he looked at him.

"Since you expect me, Mr. Creakle, to justify myself," said Steerforth, "and to say what I mean—what I have to say is, that his mother lives on charity in an alms-house."

Mr. Mell still looked at him, and still patted me kindly on the shoulder and said to himself in a whisper, if I heard right: "Yes, I thought so."

Mr. Creakle turned to his assistant, with a severe frown and labored politeness:

"Now you hear what this gentleman says, Mr. Mell. Have the goodness, if you please, to set him right before the assembled school."

"He is right, sir, without correction," returned Mr. Mell, in the midst of a dead silence; "what he has said is true."

"Be so good as to declare publicly, will you," said Mr. Creakle, putting his head on one side, and rolling his eyes round the school, "whether it ever came to my knowledge until this moment?"

"I believe not directly," he returned.

"Why, you know not," said Mr. Creakle. "Don't you, man?"

"I apprehend you never supposed my worldly circumstances to be very good," replied the assistant. "You know what my position is and always has been here."

"I apprehend, if you come to that," said Mr. Creakle, with his veins swelling again bigger than ever, "that you've been in a wrong position altogether, and mistook this for a charity school. Mr. Mell, we'll part, if you please. The sooner the better."

"There is no time," answered Mr. Mell, rising, "like the present"

"Sir, to you!" said Mr. Creakle.

"I take my leave of you, Mr. Creakle, and all of you," said Mr. Mell, glancing round the rokm, and again patting me gently on the shoulder. "James Steerforth, the best wish I can leave you is that you may come to be ashamed of what you have done today. At present I would prefer to see you anything rather than a friend, to me, or to any one in whom I feel an interest."

Once more he laid his hand upon my shoulder; and then taking his flute and a few books from his desk, and leaving the key in it for his successor, he went out of the school, with his property under his arm. Mr. Mr. Creakle then made a speech, through Tungay, in which he thanked Steerforth for asserting (though perhaps too warmly) the independence and respectability of Salem House; and which he wound up by shaking hands with Steerforth, while we gave three cheers—I did not quite know what for, but I supposed for Steerforth, and so joined in then ardently though I felt miserable. Mr. Creakle then caned Tommy Traddles for being discovered in tears, instead of cheers, on account ol Mr. Mell's departure; and went back to his sofa, or his bed, or wherever he had come from.

We were left to ourselves now, and looked very blank, I recollect, on one another. For myself, I felt so much self-reproach and contrition for my part in what had happened, that nothing would have enabled me to keep back my tears but that the fear that Steerforth, who often looked at me, I saw, might think it unfriendly —or, I should rather say, considering our relative ages, and the feeling with which I regarded him, undutiful —if I showed the emotion which distressed me. He was very angry with tradd

Traddles, and said he was glad he had caught it.

Poor Traddles, who had passed the stage of lying with his head upon the desk, and was relieving himself as usual with a burst of skeletons, said he didn't care, Mr. Mell was ill-used.

"Who has ill-used him, you girl?" said Steerforth.

"Why, you have," returned Traddles.

"What have I done?" said Steerforth.

"What have you done?" retorted Traddles. "Hurt his feelings and lost him his situation."

"His feelings!" repeated Steerforth disdainfully. "His feelings will soon get the better of it, I'll be bound. "His feelings are not like yours, Miss Traddles. As to his situation—which was a precious one, wasn't it?—do you suppose I am not going to write home, and take care that he gets nsome money? Polly?"

We thought this intention very noble in Steerforth, whose mother was a widow, and rich, and would do almost anything, it was said, that he asked her. We were all extremely glad to see Traddles put down, and exalted Steerforth to the skies; especially when he told us, as he condescended to do, that what he had done had been done expressly for us, and for our cause, and that he had conferred a great boon upon us by unselfishly doing it.

But I must say that when I was going on with a story in the dark that night, Mr. Mell's old flute seemed more than once to sound mournfully in my ears; and that when at last Steerforth was tired, and I lay down in my bed, I fancied it playing so sorrowfully somewhere, that I was quite wretched.

I soon forgot him in the contemplation of Steerforth, who, in an easy amateur way, and without any book

Better Than Spanking.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her today if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

CRITICAL TIME OF WOMAN'S LIFE

From 40 to 50 Years of Age. How It May Be Passed in Safety.

So. Wellington, B.C.—"For a year during the Change of Life I was all run down. I was really too weak to walk and was very despondent and thought I was going to die, but after taking Lydia E. Pinkham's Vegetable Compound and Blood Purifier my health and strength returned. I am very thankful to you and praise your medicine. I have advised several women who suffered as I did to try your remedies. You may publish this if you wish."—Mrs. DAVID R. MORRIS, South Wellington, Vancouver Island, B. C.

No other medicine for woman's ills has received such wide-spread and unqualified endorsement. We know of no other medicine which has such a record of success as has Lydia E. Pinkham's Vegetable Compound. For more than 30 years it has been the standard remedy for woman's ills such as inflammation, ulceration, tumors, irregularities, periodic pains and nervous prostration, and we believe it is unequalled for women during the period of change of life.

If you have the slightest doubt that Lydia E. Pinkham's Vegetable Compound will help you, write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass., for advice. Your letter will be opened, read and answered by a woman, and held in strict confidence.

Next term will begin Thursday, January 2nd. Send for Catalogue.

THE ST. JOHN Business COLLEGE

S. KERR Principal.

Farmer Ads. will Bring Results.

(he seemed to know everything by heart), took some of his classes until a new master was found. The new master came from a grammar-school, and before he entered on his duties, dined in the parlor one day, to be introduced to Steerforth. Steerforth approved of him highly, and told us he was a brick. Without exactly understanding what learned distinction was meant by this, I respected him greatly for it, and had no doubt whatever of his superior knowledge: though he never took the pains with me—not that I was anybody—that Mell had taken.

There was only one other event in this half-year, out of the daily school life, that made an impression on me that still survives. It survives for many reasons. One afternoon, when we were all harassed into a state of dire confusion, and Mr. Creakle was laying about him dreadfully, Tungay came in, and called out in his usual strong way' "Visitors for Copperfield!"

A lew words were exchanged between him and Mr. Creakle, as, who the visitors were, and what room they were to be shown into; and then I, who had, according to custom, stood up on the announcement being made, and felt quite faint with astonishment, was told to go by the back stairs and get a clean frill on, before I repaired to the dining-room. These orders I obeyed, in such a flutter and hurry of my young spirits as I had never known before; and when I got to the parlor door, and the thought came into my head that it might be my mother—I had only thought of Mr. or Miss Murdstone until then—I drew back my hand from the lock, and stopped to have a sob before I went in.

At first I saw nobody; but feeling a pressure against the door, I looked round it, and there, to my amazement, were Mr. Peggotty and Ham, ducking at me with their hats, and squeezing one another against the wall. I could not help laughing; but it was much more in the pleasure of seeing them, than at the appearance they made. We shook hands in a very cordial way; and I laughed and laughed; until I pulled out my pocket handkerchief and wiped my eyes.

Mr. Peggotty (who never shut his mouth once, I remember, during the visit) showed great concern when he saw me do this, and nudged Ham to say more things.

"Cheer up, Mas'r Davy boy!" said Ham, in his simpering way. "Why, how you have growed!"

"Am I grown?" I said, drying my eyes. I was not crying at anything particular, that I know of; but somehow it made me cry, to see old friends."

"Growed, Mas'r Davy Boy? Ain't he growed!" said Ham.

"Ain't he growed!" said Mr. Peggotty.

They made me laugh again by laughing at each other, and then we all three laughed until I was in danger of crying again.

"Do you know how mamma is, Mr. Peggotty?" I said. "And how my dear, dear, old Peggotty is?"

"Oncommon," said Mr. Peggotty.

"And little Emjly, and Mrs. Gummidge?"

"On—common," said Mr. Peggotty.

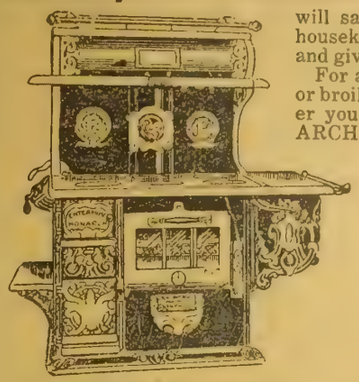
There was silence. Mr. Peggotty to relieve it, took two prodigious lobsters, and an enormous crab, and a large canvas bag of shrimps, out of his pockets, and piled them up in Ham's arms.

"You see," said Mr. Peggotty, knowing as you were partial to a little relish with your wittles when you was along with us, we took the liberty. The old mawther biled 'em, she did. Mrs. Gummidge biled 'em. Yes," said Mr. Peggotty, slowly, who I thought appeared to stick to the subject on account of having no other

A Castle in Spain

is "not in it" with a good, substantial, up-to-date steel range in your kitchen. Don't hoard up all your money, building castles for future years, and in the meantime have your wife worn out in daily toil, working with a poor stove. The Farmer's wife, as well as the Farmer, needs good tools. A few dollars invested now in an—

Enterprise Monarch Steel Range



will save the time and temper of the housekeeper, lessen fuel and repair bills and give satisfaction through years of use

For a quick, responsive fire for baking or broiling, and lots of hot water (whether you burn wood or coal) the MONARCH is what you should have.

WE CLAIM it is as good as any range on the market—and better than most. Not the cheapest, nor the dearest, but

MY FREE TRIAL TREATMENT MAY CURE YOU

Kingston, Ont., June 6th, 1909.

Dear Mrs. Currah,—I feel so very much better after using the 10 days' treatment of ORANGE LILY you were kind enough to send, that I will not require any more. In fact, I feel entirely well, and it is now a month since I stopped using the treatment. (Miss) F. W. T.

Similar letters to the above are not infrequent, though, of course, such cases are not of long standing. Most women who have suffered for any length of time will require to use ORANGE LILY longer than the Trial Treatment in order to effect a complete cure, but in every case they will be perceptibly benefited. Further, the benefit will be permanent whether they continue to use ORANGE LILY or not. It is not taken internally, and does not contain any alcohol or other stimulant. It is an applied treatment, and acts directly on the suffering organs. In all cases of women's disorders, these organs are congested to a greater or less extent, and ORANGE LILY will relieve and remove this congestion just as positively and certainly as the action of ammonia or soap on soiled linen. It is a simple chemical problem, and the result is always the same, a step towards better health and complete cure.

In order that every suffering woman may prove its good qualities, I will send enough of ORANGE LILY for 10 day's treatment, absolutely free, to each lady who will send me her address. MRS. FRANCIS E. CURRAH, WINDSOR, ONT. 10

You can say goodbye to constipation with a clear conscience if you use Chamberlain's Tablets. Many have been permanently cured by their use. For sale by all dealers.

subject ready, "Mrs. Gummidge, I do assure you, she biled 'em."

I expressed my thanks. Mr. Peggotty, after looking at Ham, who stood smiling sheepishly over the shell-fish, without making any attempt to help him, said'

"We come, you see, the wind and tide making in our favor, in one of our Yarmouth lugs to Gravesen'. My sister she wrote to me the name of this here place, and wrote to me as if ever I chanced to come to Gravesen', I was to come over and inquire for Mas'r Davy, and give her dooty, humbly wishing him well, and reporting of the family as they were oncommon toe-be-sure. Little Em'ly, you see, she'll write to my sister when I go back as I see you, and as you was similarly oncommon, and so we make it quite a merry-go-rounder."

I was obliged to consider a little before I understood whas Mr. Peggotty meant by this figure, expressive of a complete circle of intelligence. I then thanked him heartily; and said, with a consciousness of reddening, that I supposed that Em'ly was altered too, since we used to pick up shells and pebbles on the beach.

"She's gettiug to be a woman, that's what she's getting to be." said Mr. Peggotty. "Ask him."

He meant Ham, who beamed with delight and assent over the bag of shrimps.

"Her pretty face!" said Mr. Peggotty, with his own shining like a light.

"Her learning!" said Ham.

"Her writing!" said Mr. Peggotty. "Why it's as black as jet! And so large it is, you might see it anywhere."

It was perfectly delightful to behold with what enthusiasm Mr. Peggotty became inspired when he thought of his little favorite. He stands before me again, his bluff hairy face irradiating with a joyful love and pride for which I can find no description. His honest eyes fire up, and sparkle, as if their depths were stirred by something bright. His broad chest heaves with pleasure. His strong loose hands clench themselves in his earnestness; and he emphasises what he says with a right arm that shows, in my pigmy view, like a sledge hammer.

(Continued in next issue)

Teach Children Cleanliness.

Children should be taught neatness and cleanliness before they are old enough to be taught to read and spell The average mother will admit that her children seem to love dirt and abhor cleanliness. Children love to play in the dirt, at least most of them do. And not all kinds of so-called dirts are very dangerous. For example, a sandpile has a decided attraction for both girls and boys; and they can get pretty dirty in a sand pile. Then there is the mud pie industry at which little folks love to work; and tots will get disgracefully dirty, but no harm is done that soap and water will not speedily correct.

Just because the child gets dirty at its play is no reason that it should not be both permitted and encouraged to play at all of the healthful out-door pastimes. But children should be taught to be clean. They should be instructed early in the care of their mouths and teeth; to keep their hands and face clean; to bathe frequently and regularly as soon as they are old enough to perform those important offices for themselves; and by both training and custom the parents should inculcate this habit from infancy.

The idea in teaching children to be clean should be to dvelop in them hygienic habits. It is first necessary, of course, that the parents themselves should acquire the habit of

MONARCH NOVELTY CO. Dept. 26 - - Toronto, Ont.

WHOOPING COUGH

LEFT A NASTY, DRY COUGH.

Doctors Could Do No Good.

Mrs. A. Mainwright, St. Mary's, Ont., writes:—"I feel it my duty to write and tell you the good your Dr. Wood's Norway Pine Syrup did for my little boy. He had whooping cough, which left him with a nasty, dry hard cough. I took him to several doctors, but they did him no good, and I could see my little lad failing day by day. I was advised to take him to another doctor, which I did, and he told me he was going into a decline. I was telling a neighbour about it, and she told me to get a bottle of Dr. Wood's Norway Pine Syrup, and give it to him regularly. She then got to tell me how much good it did her children, so I got a bottle, and gave it to my little boy, and was so pleased with the result that I bought another one, and by the time he had finished it he had no cough. He is now fat and strong, and I would not be without a bottle in the house on any account."

Whooping cough generally begins as a common cold, accompanied with coughing and a slight discharge from the nose. It is, as a rule, more of a child's trouble but also affects adults.

Dr. Wood's Norway Pine Syrup is a sure preventative if taken in time, and is also a positive cure for any of the after effects.

"Dr. Wood's" is put up in a yellow wrapper, three pine trees the trade mark; price 25 and 50 cents.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Minard's Liniment Co., Limited.

Gentlemen,—My daughter, 13 years old, was thrown from a sleigh and injured her elbow so badly it remained stiff and very painful for three years. Four bottles of MINARD'S LINIMENT completely cured her and she has not been troubled for two years.

Yours truly,
J. B. LIVESQUE.

St. Joseph, P. O., 18th Aug., 1900.

looking carefully after these things that have a direct bearing upon the health of their children. If this is done the children will soon form the habit of doing those things that make for bodily hygiene and for physical health and strength. This will mean that habits of eating, sleeping, excretion and bathing, the care of the teeth, mouth, eyes and those offices which, if carefully looked after and properly performed, tend to promote human health and efficiency, will be formed in early life and are not likely to be neglected in later years.—Chicago Department of Health

Soft Water for the Toilet.

If you would keep your skin and complexion in good condition, beware of washing in hard water. Endeavour to obtain filtered rain-water if possible. If this cannot be procured, the water must be softened by an artificial process. Here is a recipe for good water softener in the form of a powder:—Borax, in powder, half an ounce; white Castile soap, powdered, half an ounce; orris-root, two ounces; wheat flour, two ounces; almond meal, three ounces; oil of bitter almonds, five drops; oil of bergamot, one drachm. Mix throughly.

Add a tablespoonful of this to the water in which you intend washing the face, about two hours before using. A cheaper powder may be made by mixing together three ounces of fine ground oatmeal, three ounces of fine almond meal, and half an ounce of borax.

Good Receipes.

Drop Ginger Cookies—Two cupfuls of molasses, one cupful of butter, one cupful of sugar, four heaping tablespoonfuls of ginger, four heaping tablespoonfuls of soda, one cupful of boiling water, three eggs (beat well) and six cupfuls of flour. Dissolve the soda in the boiling water. Drop from teaspoon into a large bread-pan, leaving a good space between each one. This recipe will make eighty cookies.

Nut Cake—Three-fourths of a cupful of butter, one and one-half cupfuls of sugar, three eggs well beaten, one teaspoonful of soda in one and one-half tablespoonfuls of water, two cupfuls of flour sifited with salt, one tablespoonful of cinnamon, one cupful of nut-meats, one-half cupful of raisins, and one-half cupful of currants in one and one-fourth cupfuls of flour. Drop by tablespoonfuls one inch apart on buttered sheets. Bake in a moderate oven.

Home-Made Crackerjack—Take three pints of molasses and one cupful of white sugar and butter the size of an egg; boil as for taffffy. When done, add one teaspoonful of soda, and while foaming stir in eight or ten ears of nicely popped corn; pour out on a bread-board, and press into a square loaf, then roll out with a rolling pin until about an inch thick, and with a very sharp knife cut off in thin slices, and lay on a large platter to set. The cutting must be done while it is yet warm.

Eggless Cake—Crumb together one and one-half cupfuls of sugar, two and one-half cupfuls of flour, one teaspoonful. each, of nutmeg, cinnamon and alspice, one tablespoonful of lard, and, lastly, add one cupful of buttermilk and one teaspoonful of soda.

Banana Cake—One cupful of sugar, one and one-third cupfuls of butter, one-half cupful of sweet milk, three eggs, one teaspoonful of soda, two teaspoonfuls of cream of tartar, two cupfuls of flour, flavor to taste. Filling: mash two bananas to a cream, stir into boiled frosting, and put between layers. To be eaten the same day as made.

Spiced Beef-Tongue—Wash clean and

Eastlake Metallic Shingles

Economy

25% CHEAPER TO LAY

"EASTLAKE" METALLIC SHINGLES are economical not only on account of their service and long life, but in many other ways.

"EASTLAKE" METALLIC SHINGLES can be laid twenty-five per cent. cheaper than any other shingles on the market.

NO LEAKAGE

Due to the special construction of "EASTLAKE" METALLIC SHINGLES it is impossible for water, snow or sleet to back-wash or seep through. This prevents rotting of the timbers underneath, and contents of building are never spoiled.

CAN BE BENT OVER HIP ROOF

"EASTLAKE" METALLIC SHINGLES can be bent over the hip of the roof instead of having to be cut off and half the shingle wasted as with many others. This not only saves material, but saves a break in the roof, preventing a possible opening for leakage and damage.

LIGHTNING PROTECTION

"EASTLAKE" METALLIC SHINGLE Roofs cost less than wooden shingle roofs equipped with lightning rods. With an "EASTLAKE" roof you do not need lightning rods, as they not only act as a lightning conductor, but are lightningproof and fireproof.

INVESTIGATE

Before roofing your buildings, investigate carefully all kinds of roofing, including "EASTLAKE." The more closely you investigate, the stronger you will be in favor of "EASTLAKE" METALLIC SHINGLES

EASTLAKE METALLIC SHINGLE

If you want the best you will use "EASTLAKE."

Gentlemen:--I had the misfortune to freeze my toe which caused me a great deal of suffering, and although I had it treated, yet without success till I used your Nerve Ointment, which has completely cured it, and I have no hesidency in recommending it to others as the best I ever used,

Yours sincereiy,
Matthew Wood,
Point Phillip, N. S.

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid, causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous Free Trial Treatment of my well-known, reliable Chronicure, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. Chronicure succeeds where all else fails. Chronicure cleanses the blood and removes the cause. Also for a weakened, run-down condition of the system, you will find Chronicure a most satisfactory general tonic that makes you feel that life is worth living. Please tell your friends of this liberal offer, and send today for large free package, to MRS. M. SUMMERS, Box E. 309—Windsor, Ont.

Children are much more likely to contract the contagious diseases when they have colds. Whooping cough, diptheria, scarlet fever and consumption are diseases that are often contracted when the child has a cold. That is why all medical authorities say beware of colds. For the quick cure of colds you will find nothing better than Chamberlain's Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all dealers.

neatly trim a large, fresh beef-tongue, and then drop into enough boiling water to cover it well. Add a half tablespoonful salt and a small pepper-pod. Cook slowly until the tongue can be pierced with a fork, adding boiling water from time to time, if needed. Take out, and peel off the skin. Put it again over the fire in a clean saucepan; add four tablespoonfuls of sugar, one tablespoonful, each of ground allspice and cloves, one cupful of water, one-half cupful of cider vinegar, and simmer until liquor has been evaporated. Turn on ice, cut into very thin slices, and garnish with sliced lemon and parsley.

Tomato Soup—Take two-thirds cupful of tomatoes (canned ones will do) a sprig of celery and one of parsley. Add one-half cupful of water, cook and strain. To this juice add pepper, salt and a teaspoonful of butter. return to fire, and after boiling begins add one-fourth teaspoonful of soda to prevent curdling of milk. Add one cupful of skim milk and and thicken with flour (one tablespoonful previously mixed with milk.) Just before serving add one-half cup ful of rich milk.

Fruit Pudding—One-half cupful of sugar, one tablespoonful of butter stirred into the sugar, one egg beaten into the two ingredients, one-half cupful of sweet milk, two cupfuls of flour, one teaspoonful of baking-powder, one pint of fruit of any kind. Steam one hour. Sauce to suit taste.

Filled Cookies—One cupful of chopped raisins, one-half cupful of sugar, one-half cupful of water and one tablespoonful of flour. Boil the mixture until thick, watch closely, as it burns easily. While the paste is cooking, make the cookie dough by using one cupful of sugar, one-half cupful of shortening, one egg, one-half cupful of milk, three and one-half cupfuls of flour, two teaspoonfuls of cream of tartar, one teaspoonful of soda and one of vanilla. Roll the dough thin, cut out, spread the top with the paste, put another cookie on top, and bake in a moderate oven.

Peach Dumplings—One pint of flour, two tablespoonfuls of butter, one-half teaspoonful of salt, one teaspoonful of salt, one teaspoonful of baking-powder and sweet milk to mix soft dough. Roll one-half inch thick. Take pieces of dough large enough to cover two halves of a peach, dot the tops with butter and brown sugar, place in a buttered pan, pour boiling water in the bottom of the pan, and bake in a hot oven three quarters of an hour.

Corn Cake—Take one cupful of cornmeal (bolted) and a cupful of flour. Mix together with two level teaspoonfuls of baking-powder. Beat one egg, and mix with one and one-half cupfuls of milk. Add one teaspoonful of salt and one tablespoonful of sugar. Beat all well together. Butter pan well and put on the stove, and heat hot. Put mixture into hot pan, and bake in quick oven from fifteen to twenty minutes.

For Baked Fowls—If one has small ones, the fowls are often burnt before done. This is the way I do with mine: If a small one, take a piece of old clean white cloth, fold five or six times, wring out of water, lay on top of the fowl and baste as often as necessary, not removing the cloth—the cloth keeps the steam in when fowl is tender. If not brown, remove the cloth and brown the fowl. It will be much sweeter and juicier in this way.

Chocolate Pie—One-fourth teacupful of chocolate, one teacupful of hot water, butter the size of an egg, one cupful of sugar, yolks of two eggs, two tablespoonfuls of corn-starch, dissolved. Mix well, cook, let cool, add one teaspoonful of vanilla, and pour in pie shell. Beat the whites of two eggs to a stiff froth, add two tablespoonfuls of sugar, spread on pie and brown in oven.

NEW COAL OIL LIGHT Beats Electric or Gasoline

ONE FREE To Use On Your Old Lamp!

Our special introductory offer entitles one person in each locality to one free. Powerful white incandescent mantle light. Replacing common oil lamps everywhere. Burns 70 hours on one gallon of coal oil (kerosene). No odor or noise, simple, clean. Brightest and cheapest light for the home, office or store. Better light than gas or electric. Send postal for FREE OFFER and agents' wholesale prices.

AGENTS WANTED Experience Unnecessary. Make Money Evenings or Spare Time. Write Quick.

MANTLE LAMP CO., 282 Aladdin Bldg., Montreal and Winnipeg, Can.

Any Man May Easily Regain LOST VITALITY

Strong vigorous vitality, the crowning glory of mature, healthy manhood.

Do you know, reader, what this means to you?

If by these few simple inspired words (which every man may with profit read)

I should be the means of pointing out to you or other men the straight and sure, if narrow road to new manhood, new powers, new capacities for a better and more glorious physical and vital development, then in doing this I have rendered a great and lasting service to my fellow beings, and one which is infinite in its power for good

This self-same VITALITY, this builder of manhood and manly vigor, may easily be regained, and I will tell you how.

Have you ever stopped to consider that it is this VITAL FORCE which makes rugged men the real men that they are? It is this same MAN FORCE which is behind every great achievement in the world to-day, which gives the flower of our army and navy the courage to meet and face death unflinchingly, which gives the rough and rugged man of the plains that compelling power to rescue at all odds a loved one from some great peril, as our illustration here portrays, and it is this self-same, identical VITAL VIGOR which I must impart to you, reader, if you are not the man you should be.

Therefore, if I give you new vitality, I make you young again, and keep you feeling young the balance of your days. By increasing your vital supply, I soon have you answering "Simply feeling fine" to your friends' morning greetings, while they in their turn will secretly marvel at the wonderous change for the better which has come over you. A thoroughly vital, manly man is the greatest inspiration in the world; his power and fascination are felt by all women and all men alike who are near him. Nothing but death can conquer the giant of strength and manly vigor. On the other hand, how different with the half-man, the neurasthenic degenerate, who is burning up his vitality in dissipation and excesses! Is there any sight more pitiable, more repellent to one's sense of decency, then the weakling who deliberately kills his manhood and self-respect by acts of willful debauchery? Such a man has neither my sympathy nor can he profit by what of wisdom I can impart. But any man who is willing to make a fair, square fight for the return of his lost vitality and lost manhood, who will promise faithfully and honestly to discontinue any debasing practices or excesses he may be indulging, who will help me thus by helping himself to such, no matter how despondent he may be, no matter how weak and debilitated, no matter what years of folly have passed, to such a man I can offer all the encouragement in the world. Just lead a decent man's life, my friend, and then increase your VITALITY. All else will come.

I make and distribute a vitalizing appliance which I call a HEALTH BELT. I do not want you to get one of there HEALTH BELTS now nor to-morrow nor next week, for that matter, but first wish you to write for or call and get one of my little free books. I want you to thus have my whole story of this subject of VITALITY, so that you may judge for yourself. My HEALTH BELT, with suspensory attachment, is a complete treatment in itself; that is you place it comfortably around your waist nights when you go to bed and wear it at the time when you are asleep. The vitality which it produces and sends into your system hour after hour is felt as it flows in. There is no shock, but merely a pleasant, warm, soothing sensation which induces a sound, refreshing sleep. Weak back often disappears at once, and a better feeling is immediately experienced. Two or three months' wear is usually sufficient. The cost is nominal. With special attachments, my HEALTH BELT is used by women as well as men for rheumatism, kidney, liver, stomach, bladder disorders, etc.

Let Me Send You THIS BOOK Free

My book, as described above, will be sent in plain, sealed envelope to anyone who fills in the below coupon. It is fully illustrated with photo reproductions, printed on fine coated paper, and should be read by every man, young, middle aged or elderly, whether ailing or strong. Write or call to-day. Hours 9 to 6.

DR. M. F. SANDEN CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs—Please forward me your Book, as advertised, free, sealed.

Had a Weak Heart.

Doctored For Three Years Without Any Benefit.

Through one cause or another a large majority of people are troubled, more or less, with some form of heart trouble.

Little attention is paid to the slight weakness, but when it starts to beat irregularly, and every once in a while, pain seems to shoot through it, then it causes great anxiety and alarm.

Milburn's Heart and Nerve Pills will give prompt and permanent relief to all those suffering from any weakness of the heart or nerves.

Mrs. M. Shea, 193 Holland Ave., Ottawa, Ont., writes:—"I write you these lines to let you know that I have used Milburn's Heart and Nerve Pills. After doctoring for the last three years with all kinds of medicines and pills for weak heart, I heard of your Heart and Nerve Pills, so thinking I had never used anything that did me so much good, I kept on using them, and I had only used four boxes, when I was perfectly cured."

Price, 50 cents per box, 3 boxes for $1.25 at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking.

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally;

E. N. MORRIS, Manager 1900 Washer Co'p'y.

357 Yonge Street, Toronto, Can.

Annual Report of the P. E. Island Dairymen.

The annual convention of the Prince Edward Island Dairymen's Association was held last week at Charlottetown.

The report of the Secretary shows that in the past year 25,201,885 lbs. of milk for cheese were supplied. Out of this 2,424,626 lbs. of cheese were manufactured—netting 2,930 farmers $258,495.17.

As to butter 12,200,944 lbs. of milk produced 527,494 lbs. of butter, netting 910 farmers the sum of $119,-023,39.

As compared with last year there was a falling off in the cheese manufactured amounting to about $2,000 and a gain in butter amounting to about $6,000.

Amongst interesting discussions Mr. William Cain of New Perth spoke on the care of machinery, Mr. Arthur Simpson on the advance of agriculture due to dairying, Messrs. A. A. Mc Neill of O'Leary, Adam Brown and Walter Simpson on milk testing.

Rev. Dr. Gauthier spoke on the education of the cheese maker.

Mr. Harvey Mitchell gave an address on dairying, which was followed by a discussion in which P. L. Gash, Emerald, and J. Noonan, Albany, took part.

The Secretary's report was followed by a discussion in which Mr. F. S. Cousins and Mr. Lauchlin Macdonald took part.

The question of taxing the factories was considered and it was decided that an amount not exceeding $650 be assessed.

At the evening session a resolution was past favoring a government short course in dairying.

After a general discussion on various subjects the following officers were elected:—President.—J. A. Dewar, M. P. P.; Vice-President—Arthur Simpson; Secretary Treasurer.—John Anderson; Directors:—Prince.—J. Noonan, Ernest Ellis; Queen's.—John Edmonds, D. Macdonald; King's—Lauchlin Macdonald; Auditor.—H. Jenkins. The following is Inspector Morrow's report:—

Mr. President and Gentlemen:—

It is satisfactory to be able to report to you as delegates, who represent the different Dairying Companies, that the factories, with about three exceptions were kept in a very satisfactory condition, as to clean lines. Some were not house-cleaned properly before starting, but were in good shape on my second visit.

A few require new floors, or the old ones properly repaired. Some of the cement floors have not been properly laid, and are badly broken which makes them anything but sanitary. This should be kept in mind by those who purpose putting in cement floors in the future.

Some of the old vats have been replaced by a proper steel vat which costs considerable more than a wooden one, but I consider them well worth the money.

A number of factories need whey tanks, and I would suggest to procure steel tanks, as they are both permanent and sanitary.

We still have some of those old rusty and broken milk cans to talk about. We will try and have to do away with them, and get new ones. When buying new you should take care to see that they are all well made, and all the seams properly floated with solder, as there are some very poor ones for sale; some of our tinsmiths have neglected to take the necessary precautions with regards to those two important points, viz., roughly made cans and poorly soldered.

With regard to the condition of the milk supply. We had such a cool sea-

MONEY IN POTATOES

$128.00 an acre Clear

Yes Sir! We can show you how to make it in potatoes, over and above the cost of seed, fertilizer, labor, marketing and your own time.

With the market price $1.00 a bag—and better, it's worth while going in strong for potatoes and getting every last bushel the ground will yield.

We can show you how to grow 240 bushels to the acre: how to get a double crop from the same outlay of labor and seed.

A lot of potato-growing experience is boiled down and plainly told in "Money in Potatoes." We have culled out the frills that a practical farmer has no time to read. The book is complete, but brief and to the point. See the list of subjects it covers. From this book you can see how other men have got the best results. You can grow and handle bumper crops of potatoes and take the long price.

Clip the Big Crop Coupon to-day.

Someone Who Should be Remembered.

Somewhere today—in some city or town or out on some farm—a woman with a face you used to think the sweetest in all the world is waiting for something.

She is more than waiting—she is longing or maybe praying.

She goes on with her work, whatever it is, or her knitting or reading, but if you were where you could see, you'd notice she stops every little while to look toward the front gate or to find out who it was rang the doorbell!

When the postman or the rural delivery man comes, or when its time for the afternoon mail to be brought home from the post office, she is waiting to see what comes.

If there are any letters, she looks them over hurriedly and if ONE letter is not there, she lays them down and wonders a bit and then goes back to her work and her waiting.

Waiting for a letter from her boy or her girl!

Her boy or her girl who has gone away from home—and it's FAR away to her, no matter how few the miles!

She knows just how many days or weeks have passed since the last letter came.

She has read that letter over and over, and now that the waiting gets harder, she can't help thinking something may be wrong.

She has written four or five times since that letter came, so she just can not help worrying some. Of course, everything may be all right,—everything MUST be all right or surely she'd near—but if she had even a postal!

O "boy" or "girl" if you could be in her place for even a little while, you'd understand!

You'd understand so fully that no social or business engagement in all the calendar could keep you from writing at least a line or two to mother!

You will know some day, when your boy or girl has grown up and gone away from home, but likely it will be too late then to make any difference to your Mother.

Between now and the time you turn out the light tonight, write to her.

Between now and the time you turn out the light tonight, make the small effort—it doesn't take much to write a letter—that will cause the sun to rise in the old home tomorrow or the next day or the next.

Spend thirty or sixty minutes in loyalty to your first love. Make her heart happier than anything else could make it. Put a stop to all the wondering and the worrying and start a song that will carry across the miles and echo in your heart and make you happier, too.

Let the new-made "friends" wait, or pass them by altogether for one evening. Let some one else have the seat you would have filled in the country-bound trolley or the town-bound train. Telephone or send word to whoever may be expecting you that you're "glad you can't come." Tell why you're glad.

Then sit down and open your heart to her as you used to do when you came in from play or when she answered your call in the darkness.

As nearly as you can, write as you would talk, were she sitting close by.

Tell her of the burdens as well as the brightness, for there's nothing makes a mother so happy as to feel she can help her child over a rough place in the road.

Make her sure, SURE that your heart still keeps time with hers.

Then turn out the light and go to bed. You may not sleep, but you'll be happy.

IT MADE A MAN OF ME

Read what Mr. James A. Boutillier, Aspotogan, Lunen. Co., N. S., says :

Dear Sir :—I hope you will pardon my delaying so long in thanking you for the benefits your valuable Belt has given to me. I can honestly say that it did me more good than all the other medicines put together. I had been troubled with Rheumatism off and on for four or five years, especially in my knee joints and shoulders, but the pain is all gone now, and I cannot recommend your Belt too highly. It is the best remedy in the world for Rheumatism and pain in the back. You ar welcome to use this testimonial, and if I can be of any service to you I will gladly render it. Any sufferer desiring to write to me may do so, and I will be pleased to answer.

Give me a man broken down from dissipation, hard work or worry from any cause which has sapped his vitality. Let him follow my advice for three months, and I will make him as vigorous in every respect as any man of his age.

Letters like that tell the story which means a good deal to a sufferer. They are a beacon light to the one who has become discouraged from useless doctoring. I get letters every day.

My Belt has a wonderful influence upon tired, weak nerves. It braces and invigorates them and stirs up a great force of energy in a man.

Are you weak or in pain? Are you nervous or sleepless? Have you **Varicocele, Rheumatism, Weak Back, Kidney Trouble, Weak Stomach, Indigestion or Constipation**? Are you lacking in vitality? I can give you the blessing of health and strength. I can fill your body with vigor and make you feel as you did in your youth. My Electric Belt is worn while you sleep. It gives a soothing, genial warmth into the body. This is life—vigor.

Tell me where you are and I'll give you the name of a man in your town that I've cured. I've got cures in every town. That's enough. You need the cure. I've got it. I'll give it to you or you need not pay a cent. Come and get it now. The pleasurable moments of this life are too few, so don't throw any away. While there's a chance to be husky and strong, to throw out your chest and look at yourself in the glass and say "I'm a man," do it, and don't waste time thinking about it.

CALL TO-DAY

Call at my office or send me this coupon and I will send you my 80-page FREE BOOK. It points the way to Health and Prosperity.

Appendicitis.

Probably the most talked of and the least understood of diseases is appendicitis. Many think the trouble is a new one that has been invented by surgeons as an excuse to cut you up and have the pleasure that it gives them to perform a fine operation, and, incidentally, get a big fee.

The fact is that appendicitis has been coexistent with civilization, and probably existed with the earliest men. It is an inflammation of the vermiform appendix, from which people have suffered and died for centuries under the name of inflammation of the bowels or some other.

The vermiform appendix is so called from the worm-like shape. The two words are from Latin roots, the first of which, vermi, is the worm, the same as that from which comes vermi-fuge—literally a remedy to drive away worm vermin, worm-like animal life; vermicide, an agent to kill worms, and so on. Appendix suggests its own meaning in the same way, being from the same Latin root as appendage—an offshoot, tail, affix, adjunct.

The vermiform appendix is situated at the right side of the appendix, about half way between the navel, and the groin, and is an apparnetly useless attachment at the end of the small intestines. Above the beginning of the large intestines is a pouch-like enlargement called the caecum. Of this the veriform appendix is the attachment mentioned. This has a small vacuum, and of course a mucous membrane lining. Under certain conditions, irritating substances are forced into this vacuum that set

up inflammation which, if not relieved, causes suppuration, perforation and gangrene, thus fecal matter or pus—or both—will pass into the abdominal cavity, setting up further inflammations that may or may not become dangerous to life, according to the treatment that the trouble receives.

The entire trouble is usually caused by constipation. Without going into the technical details of how it is brought about, the mere and continuous over-crowding of the lower, small intestines and accessory functions sets up inflammation that extends to the appendix, which relaxes, and fecal matter is crowded into it, which is resented by the interior of the appendix, with the result related above.

When you have acquired appendicitis, you will know it, and immediate treatment is necessary, which does not mean the knife of the surgeon. Immediate relief of the impacted colon, and over-charged caecum is necessary. Large injections of warm water or infusions of spearmint—three or four quarts of each enema—should be given, and repeated if necessary until free evacuations are produced.

When the appendix is inflamed, a large and hot poultice of mullien leaf, containing some lobelia herb, and sprinkled lightly with ginger, should be applied to the abdomen directly over the appendix. Give internally, every half-hour, of an infusion of Lady Slippers, and one-half teaspoonful of lobelia to a cupful of boiling hot water. Sustain the patient's strength by giving either broth, malted milk or other liquid foods and require perfect quiet in bed. Keep the bowels active by injections, never using cathartics.

After convalescence, eat sparingly of easily digested foods, avoid constipation, and that will end appendicitis.

Honesty.

Speaking of honesty, a storekeeper looking after a young girl who had just walked out of the door, said to a customer: "Children do not seem always to understand that they have no right to help themselves to tiny bits of candy or other trifles that happen to be on the counter. The girl who has just left never comes into this shop without a little petty pilfering. She takes a peppermint drop or a chocolate, and has not an idea that she is doing anything wrong. Older people do the same thing and a merchant has no way by which he can protect himself unless he can keep his goods all the time under lock and key." Not one of us would like to be labeled in the mind of another as a thief. We can avoid this slur by being honest all through, as honest about little things as large things.—The Comrade.

Tea Leaves for Carpet Sweeping.

This used to be a common device for keeping down the dust in sweeping a carpet. I wonder if many people resort to it now? An easier holding of dust is a sprinkling of dry salt. Put it in a canister with a perforated lid, such as those in which certain cleansing powders are sold. Keeo it in a very dry place, for the salt must not be in the least degree damp. A chemist was showing me the other day a tin of some substance for preventing the rising of carpet dust, but one does not wish to spend more money than necessary on household helps of this kind.

Chamberlain's Cough Remedy has won its great reputation and extensive sale by its remarkable cures of coughs, colds and croup. It can be depended upon. Try it. Sold by all dealers.

Why Don't You Plant EWING'S Reliable Seeds

What's the use of giving your land, your time and your work for a season for anything less than the *best* crops? Ewing's Reliable Seeds have proved, for more than forty seasons, favorable and unfavorable, that they will produce the highest crops of the best quality. Ask your neighbors who plant Ewing's Seeds all about them. Plant them yourself this spring and get the full reward for your work. Your dealer should have Ewing's Reliable Seeds, but if he hasn't, write for our illustrated catalogue and order from us direct.

A Piano is no better than its hidden parts. That's why we so confidently ask you to compare the Sherlock-Manning 20th Century Piano with the best makes

MARK you, we do not urge you to buy a Sherlock-Manning Piano--we simply ask you to compare the Sherlock-Manning with the world's best.
We know that the Sherlock-Manning 20th Century Piano is

"Canada's Biggest Piano Value"

and we believe that your judgment or the judgment of any unbiased master musician, will confirm our opinion. But, before you decide, find out the essentials of a perfect piano—the features that make for lasting tonal beauty.
The piano you buy should have
—The famous Otto Higel Double Repeating Action.
—Poehlmann Wire, the best piano wire made.
—Weickert Felt Hammers, the hammers that endure.
—A full Iron Plate, and
—Billings Brass Action Flange the latest improvement

There are other essential features, but ask to be shown these—the most essential. You will find that only high-grade first quality instruments possess these. Now Sherlock-Manning 20th Century piano is the embodiement of quality. It possesses every feature that makes for piano excellence and the lasting life of the instrument. Yet—you can save money, a considerable amount of money, if you buy a Sherlock-Manning Piano. Ask us to show you where and how the saving comes in. Write for inside information anyhow.

Prove the "BISSELL" by Its Work

Do the gangs on your Harrow crowd together and raise out of the ground if it is hard? They won't do this on the "Bissell." The "Bissell" is so designed that THE GANGS CAN'T CROWD OR BUMP together no matter how hard the ground may be.

Tough soil won't stick the "Bissell." It stays right down to its work and pulverizes the ground thoroughly.

We ask you to take a "Bissell" out into the field and test it beside other Harrows. Then you will HAVE PROOF that it is A SUCCESS ON HARD LAND—THAT IT PULVERIZES THE BEST—and that it is the lightest draught.

Post yourself fully on Harrows before buying. We put our name on every Harrow so that you will know it is genuine. Ask your local dealer, or write to Dept M for free catalogue.

WINDSOR DAIRY SALT

Is The Cheapest You Can Use

not alone, because it is the purest and best salt for salting butter. But because **it will salt more butter, pound for pound, than any other salt you can use.**

The big creameries will tell you this—and show you tests to prove it.

The Agricultural Colleges demonstrate this every day.

Every farmer and dairyman—who is getting good prices for butter—is using Windsor Dairy Salt.

It is pure—it makes beautiful butter—it works in quickly—and it is the cheapest in the end. Just try it yourself.

Annual Report of the P. E. Island Dairymen.

(Continued from page 397)

son, with the exception of a few days in July that we had very little difficulty in making up almost all the milk that was offered. We had less sour milk than I have seen for a whole season in my experience. The average lbs. of milk per pound of cheese was lower this year than we have ever had before.

I consider that our dairymen should pay attention to cooling the milk and cream, and by all means keep it well covered in order to have a fine quality of cheese and butter.

I consider we have held our reputation in our export cheese and butter. The quality was more uniform this year than ever before.

Some markets still continue to make cheese that are not uniform in size. The chief objection is having them too high for the boxes. We must insist on having all cheese weighed to press, and not have them so large in the Fall as in Summer as they do not settle down on the shelves so much in cool weather.

I try to be present when convenient to look after the shipment of cheese, when they are delivered at the wharf in Charlottetown, and find that some lots are not weighed as carefully as they should be. I consider each company should have a proper scale for cheese and butter, which if carefully used would insure greater satisfaction to all parties concerned.

I have given the matter of sampling and testing milk as much attention as I could. I find in some factories too many days' milk not sampled. The sample jars should be tightly corked instead of present fasteners in use, as they cause too much evaporation. All bottles should be the same size.

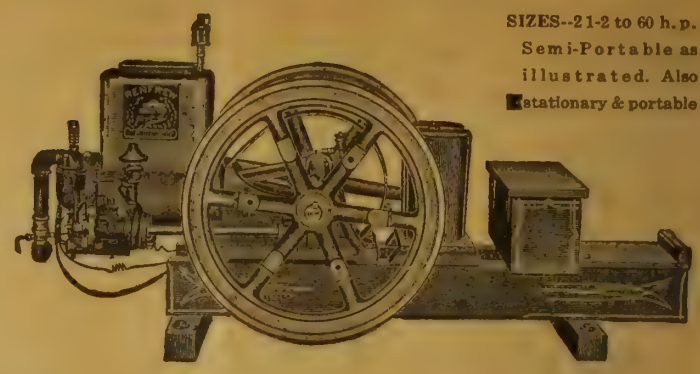
Another matter I would like to speak about is the care of the machinery. Some of our managers should take some instructions on general care of factory machinery. We would be likely to have our boilers tested and fittings kept tight and prevent loss of steam, waste of fuel, etc., which occurs in too many factories.

I would suggest that if our short course could cover the daily class another season, that they have instructions given on the care of machinery, by the best practical men available. Our managers are held responsible for a good deal, and with a few exceptions, are all good men. I consider they need further information on some subjects yet the same as other professional men.

The matter of milk production has been brought before you from time to time, and I will leave that to those who are better able to discuss such matters. It has been demonstrated by some of our best dairymen that it is certainly profitable, when conducted on business principles. We still have a large field to work in, and it is certain we must follow those who are leading in milk production the same as in other callings. In order to improve our condition we must pay more attention to the dairy cow. I also find that the largest milk producers usu[illegible]e the best milk and cream, and are always anxious to know if any further improvement is necessary in caring for their milk and cream.

A portion of the Eastern end of the Island has not had as favorable seasons for grass as some other sections and have not patronized cheese factories on account of the shortage in milk supply. Perhaps creamery work would help the live stock branch more than anything they could take up.

I would like to see them continue



SIZES--2 1-2 to 60 h.p. Semi-Portable as illustrated. Also stationary & portable

Tested With Boiling Water

Every Renfrew Standard gasoline engine is thoroughly tested before shipment. It must show at least 10 p. c. more horse power than it is rated, by an actual brake test, with boiling water in the hopper. This test also proves the soundness of the workmanship. Every

Renfrew-Standard

engine is also tested for balance. It must be so perfectly balanced that it will run with clock-like precision and smoothness. It must start easily without cranking. In short, the engine must be absolutely right in every particular before our inspectors affix their O. K's. If you were at the factory, you might think we were over-particular. But just think what our painstaking and care means to the purchaser of a Renfrew-Standard engine. It assures him getting an engine whose reliability has been proven under test—one that will give him great satisfaction.

Write for our engine catalog. It describes the Renfrew-Standard in detail, and contains information about gasoline engines that every progressive farmer would like to know.

A WARNING

TO CANADIAN FARMERS

Do not starve your crops! Wherever there is a lack of Plant food in the soil, plants cannot attain normal development; in other words, they starve! It is therefore necessary to provide the plants with the nourishment required, by judicious fertilizing. But in fertilizing be sure to use sufficient POTASH since of all Plant food substances, POTASH is most heavily drawn on from the soil. POTASH improves the quality, promotes the maturity and increases the yield of all crops.

This is a Recognised Fact
in both Science and Practice.

Further particulars and Free copies of illustrated Bulletins may be obtained from

dairying, as the cheese and butter business has done more for them than they can hope even to get from selling the raw material.

In conclusion I would say that if there are any matters that I have overlooked they might come up in the general discussion.

Thanking you all for the assistance given me in the past, I remain.

Yours Truly,

F. T. Morrow.

Mr. Morrow reports most of the factories doing good work, a considerable improvement being reported in the general quality and finish of the cheese.

How to Disinfect a Dairy Stable.

The following enquiry has come from a reader, and it is of such importance that we shall give it more than the usual attention in a condensed reply: "I wish to disinfect thoroughly some old barns I have recently bought, rendering them safe for my cattle. Will you advise me what to do and how to do it?"

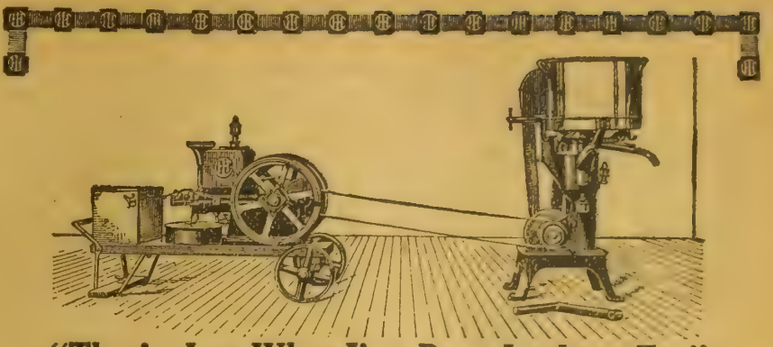
In disinfecting a stable there are some fundamental principles to be borne in mind; but unfortunately they are often left out of the procedure. It should be remembered, for instance that disease is due to infection by germs; that the germs are minute and may remain effective for extended period in stables that are dark, dirty and badly ventilated, and that any method of disinfection that does not also do away with these insanitary conditions and keep them permanently away, must fail of success. Germs thrive, grow and live in the dirt of dark, damp places. So do the insect and vegetable parasites which prey on farm animals. Sanitation, suggested by the need of sunlight, ventilation and cleanliness, therefore has the twofold effect of lessening the chances of infectious disease and keeping animals free from parasite forces. Take tuberculosis for example. The disease is due, as all our readers are aware, to the specific bacillus of the disease. No case of tuberculosis can start without its seed—the bacillus. The dark, damp, hot, badly ventilated stable cannot produce the disease any more than one can grow a crop of corn or potatoes without planting seed corn or tubers. This is true of all other germ diseases. The start of all disease is always the presence of the specific germ. It must next be remembered, however, that an animal living in a stable of the insanitary sort will be an unhealthy beast, with impure blood, sluggish circulation, and over-worked, impaired excretory organs. Disease once started runs the most rapid and fatal course in the unhealthy occupants of the stable.

The direct rays of the sun will quickly kill the germs that cause tuberculosis. The bacillus of tetanus cannot cause lockjaw in the presence of fresh air (oxygen). The germs which cause glanders, pneumonia, blood poisoning, pus formation and pus absorption (pyaemia) naval infection, strangles (colt distemper), influenza, shipping or stock yard fever of horses, purpura haemorrhagica, haemorrhagica septicaemia, anthrax, blackleg and some other diseases, including John's disease, contagious abortion and infectious vaginitis, all most surely affect animals and lurk and linger longest in the stables that are not rendered hygenic by lighting, frequent cleansing and adequate ventilation.

With a full appreciation of these essentials, then disinfection of a stable entails the putting in of sufficient amount of window glass to allow free entrance of God's good sunshine, which kills germs and is otherwise absolutely necessary for health. Each adult animal in a stable should have at least four square feet of window glass for this purpose. Fresh air is as essential, and so the stable will have to be perfectly ventilated. The King system now predominates in popularity, because it gives entrance to fresh air at the level of the ceiling forces the warm air down upon the cattle and through the medium of many air shafts in the walls and connecting with high chimneys in the roof, sucks out the vitiated air from the ground surface. True disinfection renders the provision of some such system of ventilation imperative in every stable.

See to these things first; then remove from the stable everything that possibly can harbor germs. Tear out and burn all saturated, porous, ancient timber of mangers, feed boxes and hay racks, walls, floors, partitions, and other parts of the internal fittings of the stable. And to the cremating fire add all old bedding, soiled feed and trash. Dig out four inches of dirt floor and put in new, clean earth, or a clay and cinder compost mixture wetted and tramped down; or, far better than either, put in concrete floors. Scrub and scrap the remaining woodwork or stonework. Get the dirt out of every nook, crevice, crack, crany and corner. Get rid of those festoons and cobwebs. They are filthy germ laden yet often left by the superficial cleaner of the stable.

(Continued on page 404)



"That's Just What I've Been Looking For"

WHILE we were getting the opinion of farmers on our new cream separator power outfits, one of them said: "I have been looking for such a combination as this for a long time. I need an engine with that kind of a gear on it to slow down the speed. There are half a dozen small machines on my farm for that engine to run. I want that outfit." You, too, will want it when you see it. The outfit consists of an

I H C Cream Separator

Dairymaid or Bluebell

and a one-horsepower back-geared I H C engine. The engine is mounted on a portable truck, and can be used for any farm work to which power can be applied. The back gear adjustment runs at the proper speed to operate any hand turned machine.

The working parts on I H C cream separators are accurately made and all bearings are well lubricated. The shafts and spindle are the strongest used in any separator. The gears are easily accessible for cleaning. Both separators have the famous I H C dirt-arrester chamber.

See the I H C local agent and ask him to explain carefully all of the good points of these outfits. You can get catalogues and full information from him, or, write the nearest branch house.

Raising Poultry for Profit--How to Begin.

(Continued from page 379)

This ration may be continued until full grown, though whole wheat, oats, corn, may be fed once a day for a change. Use hoppers and feed everything dry and you will have little trouble with sick hens. When the chickens are, say two months old, the roosters should be removed to a pen by themselves, as they are greedy creatures, and not very altruistic at any time. When the pullets are four or five months old they should be removed to the winter laying, or if they are to remain in the same house in which they have been reared it should now be fitted up with dry feed boxes and nests so that the young pullets may get down to business as soon as possible, for remember "it is the hen that lays that is the hen that pays."

WINTER LAYING HOUSES FOR HENS.

The size of the house will depend upon the number of hens you wish to keep in it, but no one house should contain more than fifty hens. Hens do not lay nearly so well when crowded, or when more than forty-five ot fifty are confined on one pen. There are a great variety of hen houses used by the different experimental stations and some of them are unnecessarily expensive. The supposed great cost of housing hens has done more to keep people from raising chickens than anything else that I know; and much that is written in poultry books and journals is the veriest nonsense, as anyone can easily prove for himself. When the beginner is instructed to put in concrete walls a foot below the ground and a foot above the solid concrete floors, you will know that the instruction is not for you. That is the plan followed by many clever persons who raise chickens by the tens of thousands on paper, or in their minds, but who never actually raised one hundred and made them pay their keep. All over the country you will find where industries of that kind have been started, and where the man or oftener the company, went bankrupt inside of two years. It only takes a few experiences of that kind to leave the impression in peoples minds that there is no money in hens. But you will please observe that the fault was not with the hens

Again, it is believed by many that the houses ought to be made as warm as possible, hence, we often see hen houses with inside ceiling all round the walls and three or four inches of saw dust between this and the outer wall: the doors and windows made as tight as possible and no ventilation of any kind allowed. This is a house you are better without. It is expensive, unsanitary and unprofitable. A dry cold house is the best and such a house can be built very cheap. My hens are all housed at less than $25.00 per hundred hens, and I never saw hens that had a better appetite, or that seemed to enjoy their work more than mine. At present I have three hen houses and a rooster house. Each of the hen houses contains forty-five hens.

House No. 1 is 8x16 with a shed roof. It is ceiled all round inside and well lined. It has a window 5x1 facing south, which is seldom or never in, and has an inside shutter of wood which is let down at night. There is a window and a door in the west end. The roosters are all on the nnrth side where the hen house joins the barn. The door is hooked open two and a half inches every night for ventilation. If the doors and windows in this house were kept closed this would be a very warm house.

House No. 2 is also 8x16 but with the roof pitched to the square. This house I built to suit myself, and was intended to be something of an experiment. I had gradually developed the idea that warm hen houses were not good and that better results might be obtained in a colder house. So this house was built of planed hemlock boards with the planed side inside. It is single boarded and wholly without shingles, clapboards or tar or other kind of paper. The cracks are simply battened over with two and a half inch wide battens on both sides and roof. It has two windows in the south side, one a fixture, and the other removable. Both windows are of ten-cent cotton oiled with paint oil which makes them wind and air tight. They give almost as much light as glass. At any rate they give plenty light. The window which is a fixture is two feet long and fifteen inches wide and is placed just in front of the roosts, or about five feet from east end. The other is in a frame about two feet square, and is removed every morning cold or hot, and, indeed, oftener than not it is never put in from one day to another. Only when the wind blows hard or when a storm is threatening is it put in at nights and never for frosts alone. It has been out in ten to fifteen degrees below zero, night and day, and even in that temperature last winter my hens struck "high day" more than once. The door of this house is in the west end and in the afternoons on bright days I put the window in to kill the draught and then open wide the door. It is something altogether remarkable how much frost a hen will stand if the sun is shining upon her. This house has a floor reaching back from the door to within one foot of the roosts. This floor is absolutely tight. At the end next the roosts it has a wide board standing on edge so that the chaff on the feeding floor cannot be scratched under the roosts, nor the droppings from under the roost scratched out over the feeding floor. There is no dropping board. The space under the roosts is dug down a foot and then well banked round so as to be wind proof. The floor is swept up once every two weeks and the litter changed, but mind every thing is frozen hard as bullets and as dry as nuts. The nests are on the walls and underneath them are the dry feed hoppers which are never empty. The gable over the roosts is filled with straw and there is a ventilator over the door. The feed boxes are supplied with about equal proportions of cornmeal, bran, middlings with a few handfuls of beef scrap. Grit, oyster shells, charcoal and water are before them all the time. Sometimes the hens prefer snow to water, and often it is supplied along with the water. They will often leave the new, clean water and eat the cleaner snow. You know a hen is peculiar, and few of us know as much about some things as she does. In the morning about eight o'clock they are fed with the whole oats on the floor. At noon, green food, such as turnips and potatoes are fed whole. They might better be ground, but I have no grinder, so I let them help me in that respect and save money at the same time. Remember I am keeping poultry for profit, but the profit is intended to be for myself and not for the man in the city who deals in furniture for hen houses. I believe that a dollar saved is better than a dollar earned in the hen business, for you save the time it takes to earn that dollar, and time has now come to be money in this country. At 4.30 p. m. in winter they are fed whole wheat, oats cracked, or whole corn in the litter to warm them up before going to roost for the night.

"I Doubled My Crop"

This is the story that can be told by hundreds of happy farmers in Canada who have used a 10% Potash Fertilizer. One farmer in Nova Scotia who ordinarily raised a crop of 120 bushels of potatoes with no fertilizer managed to raise 302 bushels with a low-grade fertilizer but with a 10% Potash Fertilizer he raised 442 bushels per acre of his land. We can tell you of many other cases just like this. If you want to do the same on your farm, you must learn quickly that

"Potash Pays"

Every crop you raise takes from your land just so much Nitrogen, Phosphoric Acid and POTASH. This is the food the plants eat. You must help Nature put back this plant food into your soil if you wish to raise good crops each year. You probably understand this, and it is likely you use some sort of fertilizer, but ***if you are not using a 10% POTASH fertilizer you are not getting the best crops from your land.*** This is because every plant eats three times as much POTASH as it does Phosphoric Acid. Ordinary low grade fertilizers contain from 6 to 8% Phosphoric Acid and but 2% POTASH. Certainly this is not three times as much POTASH. Therefore, you want to raise this percentage to 10% of POTASH.

If YOU want to raise a bumper crop this year, do this: Insist that your dealer provide you with a 10% POTASH fertilizer. If he cannot do this, and you have to buy a low-grade fertilizer, add enough POTASH to it to raise it to 10% POTASH. We will tell you exactly how to do this, free. You can mix your own fertilizer at home if you want to and our experts will tell you how to do this too, without charge.

Get in touch with your fertilizer dealer NOW, so that he will be sure to have POTASH on hand for you when you need it. Send us your dealer's name and we will send you a free booklet telling how to properly raise the kind of crops you deal in. It is written by some of the very best Agricultural Experts in the world and will surely be of great interest to you. Simply write us stating your dealer's name and telling us the kind of crops you raise.

If you want your POTASH now and your dealer has not got it, we will sell it to you direct. Simply let us know your requirements. The main thing to do is to ACT NOW. Write us today.

German Kali Works, Inc.,

Temple Bldg., TORONTO, Ont.

We have Muriate and Sulphate of POTASH stored ready for immediate shipment at St. John, N. B., Montreal and Toronto.

...House No. 3 is 8x15 and same style as house No. 2 except that the middle window, 20x20 in. on the south side is of glass, and above it is a shutter 24x6 in. which is left open all day and fine nights. This house was built in November, 1912, from boards that were out in the wet and were frozen over when I was building the house. I could not get battens for the cracks so I covered the whole house with single-ply tar paper. The door in the west end has been open every day this winter and the birds are kept in by a screen door made of laths. This is my pullet house and I was honestly afraid that they would perish on me when I found the winter was on and that lumber never got a chance to dry out, but will you believe it the pullets in that house are as dapper as can be and are laying the best of any. I am delighted with them and they always seem glad to see me, especially if I happen to have a bucket in my hand. Oh, yes, a hen is a wonderfully knowing bird, and she knows good wheat from bad as well as a government grain tester. I acknowledge that my hens are just a little crowded this winter, but it is not the result of ignorance but simply because I had not the heart to kill those lovely pullets last fall. I said I will let them take their chance this winter, and try and have better accommodation for next winter. There are some pullets in the other two houses, but now, I cannot tell tother from which.

Now Mr. Editor, this is the simple story of a man who has made money out of hens, and if any one who reads says: Oh, anybody can make money out of a few hens if he gives all his time to them, you may reply for me to the effect that I give very little time to them other than to instruct my boys what to do, how and what to feed, etc., and that I personally have not seen them fed ten times in the morning in ten years, and that in all those years I have not spent as much time working with them each day as it would take me to smoke three cigars, or at least, as long as it takes most people to do it. I never tried one myself. And besides, being a very busy man every day I am often away from home a week, a month, two months at a time but still the hens keep up the tune, and my wife says she can make them lay as many eggs as I. Well, we'll not argue that point just now.

Now, just a word in conclusion. I am often asked by my friends and neighbors "What is the secret about making money with hens?" Well so far as my experience goes, there is only one way to make money with hens, and that is by the process of keeping the hens at it, all at it, always at it, laying eggs.

I have had as many as 400 hens and chickens running in one field and never lost one through sickness. I never was guilty of making less than one dollar a head on hens.

Edwin Smith.

The Manse, Chipman, N. B., Feb. 13, 1913.

Oliver Plows Have Stood the Test of Time

FIFTY-SEVEN years ago, when James Oliver made his first plow, he made up his mind to make as good a plow as he could make, and to make a plow a little better than anybody else was making. Through all the years that Oliver plows have been built, through times of prosperity and adversity, these two ideas of James Oliver's have guided the whole organization in the building of Oliver plows. To show how thoroughly the plow situation is studied by these efficient manufacturers, and to convince you that plows made by them will do your work, it is only necessary to point out the well-known rule of the Oliver Plow Works: "Make and sell only those plows which you know from experience will do good work when they are sold."

Oliver Plows for Eastern Canada

consist of a group made specially for this country. It includes walking plows, three-wheel sulkies, walking gangs, high and low lift gangs, hillside plows, and riding cultivators. Perhaps the most popular plows in this line are the Oliver 1-C sulky and 1-C gang. They are so built that the two furrow wheels which carry most of the weight of the plow are traveling on a smooth surface at all times. This, in connection with a spring on the land wheel, and the two bails, insures the evenest possible depth of plowing. These two plows can be used in almost every part of Eastern Canada.

The shape and construction of the share and the kind of material to be used; the construction of the frog; the amount of beam landing; the strength and design of the frame; these are but a few of the points which are brought out by thorough experimenting before an Oliver plow is sold.

You can see any plow in the Oliver line at the place of business of the I H C local agent. See him for catalogues and full information, or, write the nearest branch house.

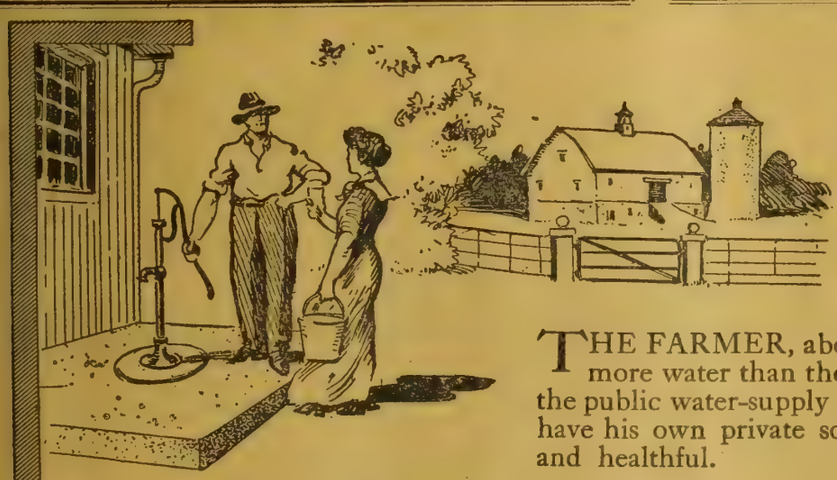
Care of Horses Feet.

One of the things to observe in caring for the horses is to see that everevery evening after a day's work in the field their feet are cared for, freed from all dirt and washed and rubbed dry. Horses will improve under this kind of treatment. A very large portion of horse ailments come through a proper lack of the care of the feet. Horses that are artificially shod or driven on artificial roads, standing on artificial floors, all of which are injurious to the feet, call for extra care on the part of the owner or driver. If the horse's feet are neglected, the hoofs are likely to become hard and cracked or else get soft and smell offensive and cause such diseases as thrush and canker, and other foot troubles are likely to develop. Never allow the shoes to stay on until they are worn out or drop off of their own accord. Look aftet the horse's feet.



SPARKLING WATER, cool and sweet, refreshes the farmer who builds a

Concrete Well or Tank

THE FARMER, above all others, appreciates good water. He drinks more water than the city man. The city-dweller is dependent upon the public water-supply for the purity of his water, while the farmer can have his own private source of water, and thus be sure that it is pure and healthful.

MAN hasn't found a better drink than cool water, properly collected and stored. But in order to keep water fresh and pure, a tank or well casing that will keep out every possible impurity must be used.

CONCRETE IS THE IDEAL MATERIAL FOR TANKS AND WELL-CASINGS.

IT is absolutely water-tight, protecting your water from seepage of all kinds. It cannot rot or crumble. It is easily cleaned inside. Time and water, instead of causing it to decay, actually make it stronger.

THERE are scores of other uses for concrete on your farm—on every farm. If you would like to know of them, write for our book, "What the Farmer Can Do With Concrete." The book is absolutely free.

OUR Farmers' Information Department will help you to decide how to build anything, from a porch-step to a silo. The service is free—you don't even have to promise to build. When in doubt ask the Information Department.

How to Disenfect a Dairy Stable.

(Continued from page 401)

Now saturate everything above, below and on every side, with a strong effective, disinfecting solution. That means a solution that will actually kill each germ it touches; not merely stun it, make it weak, wobbly or sick at the stomach. Such a disinfectant may not have a bad smell. Some of the poorest disinfectants smell the worst. Use a solution of six ounces of formaldehyde to the gallon of water; or a 1-50 mixture of commercial coal tar disinfectant; or compound solution of cresol; or two or three ounces of liquid carbolic acid (95 per cent. pure) to a gallon of water. Put the liquid on with a spray pump which forces it into every place possibly occupied by germs and follow it with a thorough spraying with fresh-made lime wash containing a pound of chloride of lime to each three gallons.

The following formula for lime wash with an added disinfectant, is also recommended by the Bureau of Animal Husbandry. To prepare five gallons: Slake 7½ pounds of lime, using hot water, if necessary to start action. Mix to a creamy consistency with water. Stir in 15 fluid ounces of 95 per cent. pure liquid carbolic acid and make up five gallons. Stir thoroughly and strain through a wire sieve, if it is to be applied by means of a spray nozzle. Where disease has been known to exist we do not only disinfect the entire stable according to above plan, but also flood the floors with the lime and disinfectant wash combination.—A. S. Alexander.

The Summerside Seed Fair.

The Seed Fair held in Summerside, P. E. I., on the 4th, 5th and 6th, of this month, came off very successfully, being blessed with the best of weather and attendance. The oats and barley were not as good color as they were last year, but the wheat was better than ever, there was 52 samples of Banner Oats. The potato exhibit was better than ever, there being about 200 half-bushels samples.

The whole exhibit showed that the Department of Agriculture was doing excellent work in P. E. Island and all the exhibitors were experts.

Lectures were delivered by J. A. Telfer, W. Cameron, F. A. Benson, Prof. Ross, Father Gauthier and others.

JUDGES.

Potatoes—R. Robertson.

Oats and Timothy—S. Moore and Prof. Clark.

Barley, Wheat and Buckwheat—Richard Creed, Albion, and John Andrews.

White Fife Wheat, 2 bus.—1, M. McArthur, Kensington; 2, Fred Bulman, Rustico; 3, John A. Plaisteed, Arlington, Lot 14.

BEWARE OF IMITATIONS SOLD ON THE MERITS OF MINARD'S LINIMENT

Minard's Liniment Co., Limited

Why Red Rose is a "Distinctive" Tea

Because it is largely composed of the fine teas of Northern India, which are generous in strength and richness. These, blended with the flavory teas of Ceylon, produce the qualities for which Red Rose is famed.

N.B.—Coffee users will find Red Rose Coffee as generously good as Red Rose Tea.

The Results At The Kerwood Cheese Factory

EVERY week or so we receive letters from creameries and cheese and butter factories, reporting tests made with the Standard cream separator. For example, the Kerwood Cheese and Butter Factory reports as follows on tests made Oct. 29, 1912:

Test No.	Per cent. of Butter Fat in Cream	In Skim Milk
1	38	.02
2	43.5	.02
3	45	.03

In each of the above tests the mjlk was fed to the machine at the rate of 684 lbs. per hour (machine listed at 600 lbs.) and the bowl was flushed, and when taken apart was free from cream and in good condition. The milk skimmed was not new milk but had been kept over some of it two days old. You will note by the above figures that the milk was fed to the machine nearly 100 lbs. per hour faster than its rated capacity and that the cream skimmed contained a high per cent. of butter fat, so that I consider the work done in this test exceptionally good.

(Signed) W. WADDELL

Proprietor, Kerwood Cheese and Butter Factory.

The above test again emphasizes the superiority of the Standard in close skimming. Even old milk, fast-skimming and heavy rich cream did not prevent the Standard from skimming closer than other separators do under most favorable conditions. *Figure it out.* It will pay you to discard your old machine and get a *"Standard"* and do it now. There is no other that can give you equal results and it's results that count. Send for descriptive catalog.

Silver cup donated by Geo. Grady, Summerside, for McIntyre's and other early and other later variety of potatoes, to be won twice. Won in 1912 by B. A. Mallet, York, in 1913 by B. Mallet.

Silver cup donated by Hon. Chas. Dalton, for the largest and most creditable number of exhibits in the seed division. Won in 1912 by B. A. Mallet, 1913 by B. A. Mallet.

$5.00 in gold donated by Carter & Co., Charlottetown, for best sample 2 bus. wheat, from fields in the standing competition of 1912 won by H. Wright and Fred Bullman.

FLORICULTURE.

Lottie, of Moncton, writes:—Will you please tell me how to plant the seed or pit of the common date and how long it takes to grow a palm from them? Can the palms such as are commonly seen in houses be grown from seed, and where can they be obtained? I have a Calla Lily that grows well and throws up buds, which turn brown before they develop. One bud, however, is green as a leaf with just a narrow fringe of white around the top. What is the cause of this, and the remedy?

Plant the date pit in light soil in a small pot, keep moist and in a light window. The first season there will be only one grass-like leaf from this seed but the next season, the character leaves will form. About three years should give you a plant eighteen inches high, and a foot across. It is a very hardy plant and will stand lots of neglect after it is once established and, unlike most palms, will take some sunshine. This seed is from the date we eat. The common palms, such as the Rentias, Arecas, Latanias are grown from seed but it would be rather difficult to do so in the house as they require a forcing heat under the soil that would be hard to arrange. The seed can be obtained from the large seed houses in Toronto. The Calla Lily is apparently suffering from lack of nourishment. Apply freely liquid cow manure twice a week while in bud and you will probably see an improvement.

John, St. John, writes:—I have two Japanese Fern balls that were given me last season. One came out a mass of leaves, the other seems to be dead at the bottom while the top looks nicely. Would it do to cut off the bottom? How often should they be watered?

By all means cut off the dead portion, you can thus place the growing part in a fern pan and they make a pretty centrepiece for the dining room table when treated thus. Water every two days if in any sunlight if in perfect shade they would not require it so frequently.

Repot Palms, Rubber Plant and all Ferns that are much root bound now but never repot such plants unless they are thoroughly root bound. Use one size larger pot only, firming the soil in with a thin stick and watering thoroughly. Use good, light fibrous loam.

The new sword fern, the Pearsoni, is a beauty. It is just as much prettier than the Boston fern as that variety was ahead of the old upright growing fern and it is just as easy to grow. The Whelmani is one of the next lovely ferns, the thick foliage making such a show when quite small and it is so tough and hardy.

The Pandamus Vertchii is a beautiful ornamental plant for the parlor and quite a change from palms. It is easily grown, making it a very desirable plant for the drawing room.

The Norfolk Pine or Amacaria is also a splendid decorative plant and should be much used. They used to be quite expensive but in the last few years they have been quite a fad for parlor plants, and such quantities have been produced that they can be bought as reasonably as a Rubber Plant. They require the same treatment as a palm and do not want much, if any, sunlight. They are tough and not injured by handling as are the Rubber plants. Their deep, glossy, green foliage gives a handsome effect in a light apartment.

If early Pansies are wanted, especially if one has a hot bed, the seed should be sown now in a small box in light soil. We find an excellent method to sow all fine seed is to fill a box about three inches deep, full of fine soil, press it down firmly with a small piece of board and water thoroughly then sow the seed broadcast and as evenly as possible with a fine sieve. Sift sand evenly over the surface entirely covering the soil. Press this down firmly also with the piece of board and water thoroughly. Cover from sunlight and keep moist. If seeds are course and you find that the watering disturbs the sand and seeds you will have to put in a deeper layer of sand. This you can only learn by experience.

Finish This Story

A WORKMAN in an I H C wagon factory was explaining the various stages of wagon construction to an interested visitor. He picked up two pieces of long leaf yellow pine, which to all appearances were sawed from the same board, and asked the visitor to notice the difference in the weight of the two pieces. The lighter piece, he explained, was kiln-dried. The heavier piece was air-dried and more thoroughly seasoned. It had retained the resinous sap which adds strength and toughness, while in the kiln-dried piece of lumber this sap had been drawn out by the too rapid application of heat.

Every Stick of Lumber Used in IHC Wagons is Carefully Selected, Air-Dried Stock

Here was something to think about. The visitor asked for a test as to the relative strength of the two pieces of wood. The air-dried piece held up under nearly double the weight under which the kiln-dried piece of lumber broke. The workman explained how the comparative life of air-dried and kiln-dried lumber has about as great a difference.

To the eye there was no difference between these two pieces of lumber, but when put to the test there was a vast difference. So it is throughout the construction of I H C wagons—**Petrolia,** and **Chatham.** They are built for real strength, light draft, and satisfactory service.

After seeing the care used in the construction of every part of an I H C wagon, the visitor asked: "Why don't you let people know of the great care used in selecting material and in constructing I H C wagons?"

This is what we have been trying to do, but we cannot tell it all in one short advertisement. I H C local agents handle the wagons best suited to your work. See them for literature and full information, or write the nearest branch house.

Custom Hatching and Day Old Chicks

We can supply Day Old Chicks from our Standard Utility Bred B. P. Rocks and White Leghorn Pens at rate of 20c apiece for April and 15c apiece for May delivery. Prices for Hatching Eggs supplied by customers is $3.50 per 100 eggs in lots of 75 or over.

With our modern Hatching Machinery, including new 3000 egg Candee Sectional Incubator, and long experience in the business we feel we can give satisfaction. Some 250 and 360 egg Model & Prairie State Incubator for sale.

Kinnear Poultry Company, Ltd., Sussex, N. B.

Use and Abuse of the Country Roads

Every man who travels the public highway has it in his power to do either of two things:

First—He may use the road in such a manner as to add to its life and usefulness, thereby increasing the value of the investment; or,

Second—He may misuse or abuse the road to such an extent that its life will be materially shortened, premature repairs made necessary and its value as an investment decreased.

In considering these points bear in mind that the traveler or property owner is the investor; it is his own money that he saves or wastes.

If we discuss the second proposition, the first has been answered. We will seen then how our roads are abused and misused.

First, in the case of all roads, we misuse them when we

Use narrow-tired wagons.

Drive in one track, following the ruts.

Ride or drive, or drive stock up or down the side of road embankments.

Obstruct the side ditches by throw-into them brush, old fence posts, field stones, etc.

Ride or drive, or drive stock across wooden and steel bridges faster than a walk.

Obstruct the road by permitting fences to remain on the right-of-way.

Second, in the case of earth roads, in addition to the foregoing, we misuse them when we

Attempt heavy hauling immediately after a soaking rain.

"Skid" logs in the roadway or side ditches.

Furthermore, we may abuse our road—and so our road funds—by

Moving a mass of earth to the center of the roadway and leaving it there loose and unpacked.

Making excavations in the fall.

Leaving a windrow of loose earth in the roadway after dragging.

Throwing rock into mud holes.

Failure to keep the weeds cut and ditches and drians open.

Failure to report damaged or dangerous condition of a bridge, culvert or road.

No doubt there are others, but this list will do for the present. You will see that the road user is able to injure his road by acts of commission and of omission. You may say that your supervisor is supposed to attend to the cleaning of ditches, proper grading of the road, etc. But does he do it? If not, and you know of it, you should stir up such a fuss that the man would do his duty or resign. If you do not do this, then you are abusing the road.

Probably the most pronounced of the above items is the use of narrow-tired wagons. It ought to be prohibited by law, and in some places I believe it is. These narrow tires work exceptional damage to earth roads. Go matter what care you give the roads as to construction and maintenance, the tires cut through to the bottom, especially after a rain. The same condition of the soil that will pack and improve under a four-inch tire will cut into ribbons under a narrow one. It's just the very simple proposition of distributing the load over a greater area.

Everyone knows how easy it is to drive in the rut; the horses just naturally follow the beaten paths of those before them, and it would require undue exertion to turn them out. But you may say that if you do turn out of one rut, you will make a new one. Then you are misusing the road by hauling too great a load for the condition of the earth. Contrary as it may be to practice, there is a time when the earth road should be used and when it should be let alone. No doubt you have observed that before.

I knew of a community where the timber industry thrived. Many men made a business of working in the woods; others did so at odd times. But invariably when it rained and they could not work in the fields oe elsewhere, these noble taxpayers would hook up to a load of logs and start to town to the mill. I have seen damage to the extent of at least $100 done by two teams in one day. Is that fair to the road and to the other men who helped pay for it? I know of one teamster who put six mules to a load of logs and literally ruined a newly-built dump immediately after the first rain, that should have packed it; and nothing was ever done about it. although if that man had gone to the treasurer's office and stolen $10 he'd have been jailed for it.

Riding and driving down the side of an embankment is in the same class. The first time may not hurt the road, but soon a path is formed; then water begins to cut and pretty soon an expenditure of good money is required to "fix" it. Throwing brush and other refuse in the side ditches, obstructing the road or ditches with fences, etc., is ordinarily contrary to statute. The trouble is that we dislike to "raise a row" and prosecute the offender. Would you be such a "good fellow" if this man stole ten bushels of potatoes from you? The principle is exactly the same.

When you trot your team across a bridge you risk your life, which is probably more important to you than risking the bridge. The vibration thus caused strains the bridge much more than the load itself. I saw a picture of a steel bridge that went down under a milk wagon. No doubt the bridge was too light in the first place, but the vibration of the fast-moving wagon probably caused its failure.

Unquestionably, earthwork should be done in the spring and summer. Even though the material is rolled and apparently solid, it requires the travel and the wetting of occasional rains before it is ready to go through the winter. Moving loose earth to the roadway and leaving it in that condition not only obstructs travel, but it wastes money. After dragging a road, and when the material has been brought to the centre of the roadway, the drag should be hitched square across the road and the material spread in a thin layer over the surface. A man expert in the use of a drag will not take all the earth to the centre and have to spread it again. He will leave it where he wants it at one operation.

It costs money to throw rocks into mud holes, and the disappointing feature about it is that it never helps the mud holes. Such places have an unbelieveable capacity for swallowing stone. Follow the method previously suggested, or some other that will drain the road and remove the cause of the mudhole.

It is certainly some man's duty to inspect bridges and culverts, but it is every man's duty to report any damaged or dangerous condition that he may happen to observe. There is more reason for doing so than for reporting a fire you may discover in your neighbor's buildings.

Weeds left to grow in the road not only obstruct the drainage and injure the roadway but they breed disease, are often the cause of poor health and, therefore, doctors' bills. There's something about every item and feature of this road problem that hits a man's pocket book.—John N. Eddy, in Twentieth Century Farmer.

You judge a man not by what he promises to do, but by what he has done. That is the only true test. Chamberlain's Cough Remedy judged by this standard has no superior. People everywhere speak of it in the highest terms of praise. For sale by all dealers.

When You Get Run Down

—catch cold easily—and dread, instead of enjoying, the keen winter weather—then you need

Na-Dru-Co Tasteless

Preparation of

Cod Liver Oil

This Na-Dru-Co Compound embodies the well-known nutritive and curative elements of Cod Liver Oil—Hypophosphites to build up the nerves—Extract of Wild Cherry to act on the lungs and bronchial tubes—and Extract of Malt, which, besides containing valuable nutriment itself, helps the weakened digestive organs to assimilate other food.

The disagreeable taste of raw Cod Liver Oil is entirely absent, and the Compound is decidedly pleasant to take. In 50c. and $1.00 bottles, at your Druggist's. 306

Press Notice.

As a means of furthering the policy of developing the poultry interests of the Dominion in which the Live Stock Branch of the Department of Agriculture is actively engaged, the Live Stock Commissioner is anxious to secure the name and address of each breeder of poultry in Canada who is systematically endeavoring to improve the quality of his stock, particularly from the standpoint of increased meat and egg production.

The information is desired in order that the Live Stock Branch may be brought more closely in touch with progressive poultrymen throughout the Dominion and with those whose names might be eligible for inclusion in a Dominion Poultry Directory.

As a means of securing this information, in part at least, all those who are interested are requested to write the Live Stock Commissioner, Ottawa, in

(a) The breed, variety and strain or family of poultry they are breeding.

(b) The extent to which selection for increased egg and meat production is being practised.

(c) A brief but specific statement of what has been accomplished.

(d) Whether or not they are actively engaged in trap-nesting at the present time. If not, what means are being used to select the most desirable individuals for the breeding pens.

Letters giving the above information should be addressed to the Live Stock Commissioner, Ottawa. Such communications do not require postage.

Rotation on Yarmouth County Farm.

(Continued fram page 378)

When the mowings fail to cut from 1½ to 2 tons of hay per acre, we turn them over in the fall letting them lay until spring. As soon as the ground is in condition to work, we go at it with the disc and properly disc it. Then we sow from 2 to 2½ bushels clean oats to the acre and after they are sown they are harrowed in. I prefer a light drag-harrow as it smoothes the surface better than the disc. We harrow it a couple of times each way then put on the roller and we have a fine, smooth field. After the oats are harvested we plow as soon as convenient and let it lay until the following spring, when we give it from 7 to 8 tons lobster shells to the acre and thoroughly disc and plow lightly. After giving it a light harrowing or two we leave it alone until ready to sow the turnip seed, when we take the hiller and ridge up about 28 or 30 inches apart. We have a light one-horse roller that will cover two rows. After going over the rows with the roller then comes the seeder, sowing two rows at a time, both drilling and covering. After that they are cultivated once a week and thinned when about 2½ or 3 inches high. We keep them cultivated until they commence to meet across the rows then we leave them until time to harvest. The next year we grow potatoes. The following year we set our strawberry plants and care for them. The next two years we harvest the berries after which we plow them under and seed to wheat grass and clover. Our land yields us a good crop of fine hay for four, five and sometimes six years without any other fertilizer when we repeat the operation.

A Farmer.

SARNIA WIRE FENCE

"Direct from Factory to Farm"

WE PAY THE FREIGHT

The Sarnia Fence Co., Limited, Sarnia Ont

The Direct from Factory to Farm policy of THE SARNIA FENCE COMPANY has worked a revolution in the prices of wire fence in Ontario and the East. We have, by taking the farmer into our confidence and sharing our profits with him made him feel that he had a personal interest in not only purchasing ROYAL FENCE, but have proved to him that it was in his interest to induce his neighbor to use ROYAL FENCE as every order turned to THE SARNIA FENCE COMPANY helped us reduce our cost of manufacture, and we, in turn use this advantage to keep down the price of fence. The result of this co-operation has had the effect of making THE SARNIA FENCE COMPANYS prices the standard for every part of Ontario and the East and with our plain printed price lists in the hands of every farmer it is impossible for the agent or dealer to force the farmer to pay anything higher than our prices. Our policy of one reasonable manufacturing profit and selling direct to the farmer, by mail, for cash, makes it possible for us to give better fence value than by the old method of through the middle man. We keep no travelling salesmen, we pay no commissions to anyone. We have no bad debts to ask you to help pay and the farmer gets the benefit of this saving in the price. This winter we have more than doubled the capacity of our plant we now can manufacture more fence than any other three plants in Canada, and with this additional capacity we are going to extend our field of operation and quote a FREIGHT PREPAID PRICE ON OUR FENCE TO ANY RAILROAD STATION (Electric & Boat lines not included) IN CANADA. In making our prices every farmer in Canada gets the same price on fence whether for one bale or a car load, and any difference in price between the different provinces is due to the freight which we are obliged to pay. Be careful in ordering to use the price for the province in which you live, remit cash with your order and we pay all freight and guarantee safe delivery of your fence at your station. Customers in Manitoba and West will note we quote a price for less than car load shipment and full car loads. the difference is due to the saving in freight ,and we recommend that neighbors in the West club their orders and ship in car lots as delivery is made in less than half the time as well as the saving in freight..

Remember the agent or dealer wants you to purchase from him a fence on which he can make a commission, and makes claims of quality in an attempt to account for the tremendous difference between his price and ours. Fifty thousand Ontario farmers purchased over seven hundred car loads of ROYAL FENCE during 1912, and every one of them stand ready to tell you that it is the most perfectly woven fence they ever used. The following is our guarantee,—

IF YOU FIND FOR ANY REASON THAT THE FENCE RECEIVED OF US IS NOT OF THE BEST HARD, STEEL, WIRE, THE BEST GALVANIZING, THE MOST PERFECTLY WOVEN FENCE YOU EVER PURCHASED AT ANY PRICE, YOU ARE AT LIBERTY TO RETURN IT TO US. WE WILL PAY FREIGHT BOTH WAYS AND REFUND EVERY CENT OF YOUR MONEY.

WE SET THE PRICE. OTHERS DEVOTE THEIR ENERGY TO TRY TO MEET OUR PRICES.	PRICE Car load or less in Old Ontario	PRICE Car load or less in New Ont Que. and Mar Pro	PRICE less Car load in Man and Western Prov's	PRICE Full Car Load in Man and Western Prov's

We Ship all Orders the Same Day as Received

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only 1 cent a word, you can advertise anything you wish to buy, sell or exchange. The aderess must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issie. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

Free to Stock and Poultry Raisers

We will send absolutely free, for the asking, postpaid, one of our large sixty-four page books, with insert, on the common diseases of stock and poultry. Tells how to feed all kinds of heavy and light horses, colts and mares, milch cows, calves and fattening steers; also, how to keep and feed poultry so that they will lay as well in winter as summer. No farmer should be without it.

NOW is the time to use Royal Purple Stock Specific. At a cost of only two-thirds of a cent per day per animal, it will increase it 25 per cent. in value. It permanently cured Bots, Colic, Worms, Skin Diseases and Debility. Restores run-down animals to plumpness and vigor. It will increase the milk yield three to five pounds per cow per day and make the milk richer.

Royal Purple is not a stock food. There is no filler used in its manufacture, and we import from Europe all the seeds, herbs, barks, etc., and grind them on our own premises. Therefore, we can guarantee it to you as being absolutely pure. We do not use cheap filler to make up a large package. We give you the best condition powder ever put on the market in a concentrated form.

A tablespoon levelled off, once a day, is sufficient for a full-grown animal. It prvents disease, keeps your animals in perfect health, and is absolutely harmless. It makes six-weeks-old calves as large as ordinary calves at ten weeks. You can develop six pigs ready for market in just one month's less time than you can possibly do without it, at a cost of only $1.50, saving you a month's work and food.

A 50c. package will last a horse 70 days. A $1.50 pail or air-tight tin, containing four times as much as a 50c. package, will last an animal 280 days.

If you have never used it, try it on the poorest animal you have on your place, and watch results. If it does not produce better results than anything you have ever used, or give you satisfaction, we will refund your money.

Toledo, Ont., July 1, 1910.
W. A. Jenkins Mfg. Co., London, Canada.

Gentlemen,—I have used a part of a package of your "Royal Purple Stock Specific." I fed it to one cow according to directions. She gained six pounds of milk while using part of a package. The rest of my herd reduced in milk while this one gained. I consider it has no equal.

T. G. BELLAMY.

Bondhead, Ont., Aug. 31, 1912.
The W. A. Jenkins Mfg. Co., London, Ont.

Gentlemen,—After experimenting with a great many stock foods, I was about convinced that there was very little virtue in any of it, but your dealer insisted on me trying Royal Purple Stock Specific, saying it was different from all others. I have since used a great lot of it, as I keep from ten to twenty horses and about the same of cattle. This Specific, in my opinion, is certainly in a class by itself as a conditioner, and is the best I have ever used.

GEORGE MAPES.

Clear Creek, Ont., Sept. 19, 1912.
W. A. Jenkins Mfg. Co., London, Ont.

Dear Sirs,—Your "Royal Purple" Stock Specific is the best stock conditioner I have ever had in my stables, and am never without it. I had a brood sow that had milk fever very bad. Your "Royal Purple" saved her life. Put her on her feet in three days. I had three calves last spring that got scouring very badly. Could not get it stopped until I used "Royal Purple." It did the work O.K.

Yours truly, H. B. MOULTON.

Saskatoon, Sask., Sept. 20th.
The W. A. Jenkins Mfg. Co., London, Canada.

Gentlemen,—Some months ago we bought some of your Royal Purple Stock Specific from Mr. Vogan here. We have been using it ever since, and we find it the best conditioner for driving horses we have ever tried.

H. F. McCALLUM, "The Palace Livery."

Scott, Sask., May 22nd, 1911.
The W. A. Jenkins Mfg. Co., London, Ont.

Dear Sirs,—Do you want a man to represent your Royal Purple goods in this district. I am from Ontario, and have fed your Stock Specific—got it from Mr. J. Corbett, of Brownsville. My cows, while using it, made the largest average, and tested five points over average at C.M.P. at Brownsville. I know your goods are the highest class Stock Specific on the market, and take great pleasure in representing you in this district

NORMAN G. CHARLTON.

Royal Purple Poultry Specific

will make your hens lay in winter, as well as summer, and yet a 50c. package will last 25 hens 70 days, or a $1.50 pail or air-tight tin, containing four times as much as a 50c. package, will last 280 days. It prevents poultry from losing flesh at moulting time, cures and prevents all the ordinary diseases, makes their plumage bright, and keeps them in prime condition.

Port Colborne, May 11.
W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—This is to certify that I have used one $1.50 tin of your "Royal Purple" Poultry Specific, and there is nothing that can equal it. I wanted yours again and your agent did not have any, so he gave me another brand, and I can assure you it was not worth carrying home, for my hens layed better without it. I have been from 12 to 15 dozen eggs short every week since I have not used your "Royal Purple."

CHARLES RICHARDSON.

Royal Purple

STOCK AND POULTRY SPECIFICS

A second from Mr. Richardson as follows :—

Port Colbborne, Ont., Aug. 24, 1910.
W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—Please find enclosed express order for $3.00, for which please send me two tins of your "Royal Purple" Poultry Specific.

C. RICHARDSON.

A third letter from Mr. Richardson as follows :—

Port Colborne, Ont., Aug. 29, 1910.
W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—I received two tins of "Royal Purple" Poultry Specific all O.K. I have tried all kinds of specific to make my hens lay, and I find that you are the only ones that manufacture the genuine article. All the rest, I think, is a waste of time and money to bother with. As an egg-producer, I cannot praise your Poultry Specific high enough, for I would not be without it if I had to pay double the money.

C. RICHARDSON.

Sherbrooke, Que., Aug. 1, 1910.
W. A. Jenkins Mfg. Co., London, Canada.

Dear Sirs,—I have used your Specific for one year, and have given it to my birds with good results. See my winnings at the different fairs, which will tell the tale.

MISS GEORGINA CAMIRAUD.

Royal Purple Cough Specific

During the last four years there has been an epidemic cough going through every stable in Canada, which has been a great source of annoyance to horsemen. Our Royal Purple Cough Cure will absolutely cure this cough in four days, will break up and cure distemper in ten days. Absolutely guaranteed. 50c. per tin; by mail, 55c.

Royal Purple Gall Cure

will cure all sorts of open sores on man or beast. Will absolutely dry up and cure scratches in a very few days.

Mr. Sam Owen, coachman for the Hon. Adam Beck, says: "By following directions, I find your Royal Purple Gall Cure will cure scratches and make the scabs peel off perfectly dry in about four or five days." Price, 25c.; by mail, 30c.

Royal Purple Sweat Liniment

will reduce lameness in a very short time. Mr. John M. Daly, coalman in London, says: "We have nine horses constantly teaming coal, and have all kinds of trouble with them being lame at times. I have used your Sweat Liniment for a year back, and have never known it to fail to cure sprained tendons, etc." Price, 50c., 8-ounce bottles; by mail, 60c.

Royal Purple Lice Killer

This is entirely different from any lice killer on the market. In order for you to understand the process of manufacture of this lice killer, you will have to send for one of our booklets, as we give you a full history of it there. It will entirely exterminate lice on fowls or animals with not more than one or two applications. It smothers them. Price 25c.; by mail, 30c.

Royal Purple Disinfectant (Sheep Dip)

In this line we give you the largest value for the money of any disinfectant on the market. A tin containing 1 3-8 qts. Imperial measure will cost you only 50c. Also put up in 25c. tins.

Royal Purple Roup Cure

Mr. Dulmage, the great breeder, of White Rocks, tells us that he has never used a Roup Cure that will give relief so quickly to hens suffering from Roup or kindred diseases. Our book tells you all about it. 25c. per tin; 30c. by mail.

Royal Purple Worm Powders

For animals. 25c. per tin; by mail, 30c.

In using our Stock Specific, we guarantee you better results by using the ordinary food grown on your farm, such as good hay, oats and bran, and so forth, than you can possibly obtain by using any of the many patent foods on the market. In these the percentage of nutrition is usually very small for the amount of money paid for the same. You know exactly what hay, oats, bran, chop or any farm products cost you, and ROYAL PURPLE makes animals digest these foods properly.

What we wish to impress on your mind is that we manufacture nothing but pure, unadulterated goods. Our booklet gives over 300 recommendations for our different lines from people all over Canada. While we give you above the names of a few who have used it, our best recommendation is for you to ask any person who has ever used any line we manufacture. 26

These goods may be obtained from, Halifax Seed Co., Halifax; Amherst Trading Co., Amherst; A. Horne & Co., Charlottetown; Maynes & Riley, St. John.

W. A. JENKINS MANFG. CO., London, Ont.

AN ASSORTED ORDER AMOUNTING TO $5.00 WE WILL PREPAY.

Weed, Breed and Feed.

Weed, breed and feed are the main points used at dairy institute meeting. Weigh the milk of each cow every milking. The most of the farmers will tell you that they do not have the time to bother with weighing. They are losing more time milking and feeding some of their poor cows that are not paying for their keep. The past season I have been milking a couple of two-year-old heifers. One of them gave 4500 pounds of milk—not a large production by any means—but the other produced only 1900 pounds. Did it pay me to spend the time weighing? Anyone who weighs the milk will get good pay for his time.

In the breeding work buy a good pure bred bull, not a pure bred scrub, and raise the calves from the best cows. The average dairyman will say that it costs too much money to buy a registered sire. It does not take a great deal of capital and quite often you can sell the bull to some of your neighbors for as much or more than he cost. You have the use of him for his keep and the interest on the investment. But if you have only a few cows and cannot afford a good sire and you have a near neighbor who has one that you can use, take your best cows there and don't be afraid to pay him $2.00 or more per cow. It will be one of the best investments you ever made. You cannot feed a sire for $20 or $25 per year.

I know of a case where a cow that was considered rather a poor producer was bred to a registered sire and when the calf became a three-year-old she gave over 8000 pounds of milk in a season. Her bull calves sired by a registered bull all sold for $5.00 a piece as soon as dropped and her heifer calves cannot be bought. If any one of the readers of this comment should become the owner of a good pure bred bull, don't make the mistake and turn him out where he can run at large and serve all the cows in the neighborhood free of charge and be everybody's bull. People are liable to consider him a very common individual. Such was the case with the first registered bull I owned. Since then I have always had the bull in a place where he could not get away and when I wanted to use him he was at home.

Don't be afraid that when you feed good cows you will not get the money back that you paid for the feed, for a cow to be a good producer must be kept in good physical condition just as well as must a horse that does a good season's work. The same rule can also be used in having a cow in good condition before she freshens as in having horses in good condition before commencing work in the spring. Most feeders recommend feeding one pound of feed to three or four pounds of milk produced, but in the latter end of the milking period, and if your cows are a little thin, it pays to feed a little heavier so as to have your cows in good, fair flesh when they go dry. Then when they freshen you will be surprised to see how much better they will milk than when they are dried off skin-poor and kept in that condition until freshening. The average farmer will say this kind of dairying costs too much, but he is mistaken. Weeding, breeding and feeding pay.—C. J. Devlin, in Hoard's Dairyman.

There are too few good colts raised on the farms. This should not be. Don't leave this important industry to the horse breeders alone.

This is an age of hustle. The team of 3,500 or 4,000 pound weight can haul as much in one trip as the small team can in two or more. One man can drive a big team more cheaply than two men can drive two small teams in teaming. This is the secret of the demand for big horses in the cities.

Wouldn't YOU Like To Be Able

To know—when to sell your live stock and produce so as to get the best market prices.

To get the weather reports in *advance* and so avoid damage to your crops.

To order spare parts for broken farm machinery, without having to lose time and drive miles to do it.

To summon medical assistance—instantly—in case of illness or accident.

To talk to your neighbors at *any* time—day or night—or get their help in case of fire.

To get the veterinary *quickly* when sickness strikes your live stock.

You Can Do All This—and Much More When You Have a Telephone

YOU CAN get a Telephone *at a small cost* if you will send us your name and address.

YOU and your neighbors can build, own and operate your own, Self-paying Rural Telephone System at a cost to each of the value of about 20 bushels of wheat.

WE—the Northern Electric & Mfg. Co., Limited—the *largest* and *oldest* telephone manufacturers in Canada—will *help you* to do it and *guide you* in every step of the construction work.

OUR FREE BOOK—How to Build Rural Telephones—the *most complete* work of its kind ever published—is yours for the asking.

IT TELLS you how to form a company—what material is necessary, and how to build your own line—how to operate a Rural Telephone System from start to finish—in clear, straightforward language that a child could understand.

IT CONTAINS one hundred pages—profusely illustrated—and makes the construction of a telephone system as easy as building a fence.

BE THE FIRST man in your district to suggest the idea to your neighbors. Study our Free Book so that you will know all about Rural Telephones—then it will be easy to interest your friends.

YOU CAN GET our book by simply writing for it—it costs you nothing—and we will be glad to know that you are interested.

Hadn't You Better Drop Us a Post Card Now?
You'll Get Our Book by Return of Mail.

Always the cookbook says:
"Sift Your Flour."

No lumps, you see. *Aerates* the flour, making it lighter.

Put FIVE ROSES in *your* sifter.

Never soft and sticky — never lumpy, musty, woolly.

Never *coarse*.

Milled superfine from *Manitoba's* grandest wheat.

Fine, *granular*, very dry.

Nothing remains in the sifter—FIVE ROSES is *free*, heavy.

And your bread is more *porous*, more yielding, more appetizing.

And more *Digestible*.

Because the particles are finer, *easier* to get at by the stomach juices.

Use this very fine flour—*superfine*.

FIVE ROSES.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT TE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

DE LAVAL
CREAM SEPARATORS

No Excuse for any Cow Owner Being Without One

There is no reason why any cow owner who sells cream or makes butter should be without a cream separator and there is no excuse why he should not have the best separator.

Any creameryman or experienced dairyman will tell you that a good cream separator will give you a great deal more and a great better butter than you can make with any gravity setting system and equally, of course, more and better cream, if you are selling cream.

The DE LAVAL is acknowledged by creamerymen and the best posted dairymen the world over to be the **"World's Standard"** and the one and only separator that always accomplishes the best results possible and always gives satisfaction.

You cannot make the excuse that you can't afford to buy a De Laval, because it will not only save its cost over any gravity setting in six months and any other separator in a year but is sold either for cash or on such liberal terms that it will actually pay for itself.

A little investigation will prove to you that the truth of the matter is that you really can't afford to make cream or butter **without** the use of a DE LAVAL cream separator.

The nearest De Laval local agent will be glad to demonstrate this to your own satisfaction, or you may write to us direct.

Wood or Concrete Silos, which are best?

Over in the U. S. many experiments made by the various agricultural experiment stations have conclusively shown that **silage does not keep as well in cement, stone or brick silos as in silos constructed of wood.**

Furthermore, the advantage of the wood silo over cement, stone or brick is greatest in a cold climate.

The vital question is "Which silo will keep the silage in the best condition"

If you are interested in reading the unbiased opinion of scientific investigators who have given this question careful investigation we shall be glad to send you, upon request, reprints of some of the experiment station bulletins giving in detail the reasons why wood silos make the best silage and keep it in the best condition.

We shall also be pleased to send you our silo catalog and give you any other silo information desired.

We are exclusive distributors in Canada of the World's Standard De Laval Cream Separators, and also carry a complete line of creamery and dairy machinery and supplies. If interested write for separate catalogs.

Women's Institutes of New Brunswick

Daisy E. Harrison, Gondola Pt., N. B., Acting Supervisor

DURING the summer of 1911 the Women's Institute Work was first introduced into New Brunswick and 16 organizations formed. In the Fall of 1912 the work was again taken up, those institutes visited and fourteen new branches organized with the promise of many more. Up to now we have twenty-five branches representing nine of the fifteen counties of our province with a total paid membership of 561.

The work has made rapid advancement since its introduction here and the women have shown their appreciation and ability to enter into such work. Trained lecturers have been sent out by the Department each year to familiarize the women with the work and organize where desired. Lectures on Home Nursing and Hygiene and demonstrations in cookery with short talks on food values and food combinations were given at each meeting.

The aim and object of the organization is for the betterment of the home and the motto adopted is: "For Home and Country." Those things which touch upon the daily life of the homemaker are taken up in the Institute and women unite to study those subjects and undertake work which goes towards the improvement of the home and the community.

Several of the Institutes have co-operated with the Agricultural Societies. The Welsford Branch at Ford's Mills is raising funds for the building of an agricultural hall, while other branches are assisting them in revising their prize lists. An interest in the general welfare of the locality is felt and the institute in several instances has been able to bring about many improvements. In Central Napan the members took up the matter of the building of a public hall with the result that the Institute was given the privilege of choosing the site and the hall was built and formally opened last November. This same Institute besides raising $180.00 towards the hall, presented the school with a flag and pole and gave three prizes for general proficiency. Nearly every branch has interested themselves in some special line of work—the need of which has been felt in their particular locality.

If space would permit I could make special mention of the work of the greater number of the Institutes in this direction. The prevention of the sale of cigarettes and tobacco to minors was accomplished by the Hillsboro Branch and a Law and Order League formed which has done much for the town. Hoyt Institute is making provision for the fixing of a very dangerous piece of road in their vicinity, while the Havelock Branch is arranging for a reading room for the boys of the place.

The following program is an example of the general work of the Institutes:

Jan.—"How to entertain small companies," Discussion—Can a woman be too economical? R. C. earliest remembrance. Demonstration—Carrot Pudding.—B. May Harron.

Feb.—Should a wife understand her husband's business?—Mrs. G. Neale. How would you spend a spare day?—All. R. C. clipping of prose or poetry. Demonstration—Economy Cake—Mrs. Neale.

Mar.—How can we teach our children economy?—Mrs. R. Fleming. Discussion—Heating and ventilation of a house. R. C. Don'ts. Demonstration—Spice Cake.—Mrs. Geo. Laverty. Canned Peaches—B. May Harron.

Apr.—What to prepare for dinner when meat is scarce?—Inez Green. What to plant in a small vegetable garden. Discussion—How to do spring cleaning in the easiest and best way. R. C. Quo. on Spring. Demonstration—Marble Cake.—Mrs. J. Y. Fleming.

May.—Abour Day. Election of Officers. Apron Parade. Bring pattern. Should the country woman dress more up-to-date?—Mrs. J. R. Kirkpatrick. Discussion—Paper Bag Cooking. Demonstration—All bring sandwiches. Date Cookies.—Mrs. Geo. Sanderson.

June.—Food value of strawberries and canning.—B. M. Harron. Systematic Housework.—Mrs. W. J. Craig. How to prepare simple meals in berry time.—All. How to can vegetables.—All. R. C. Patriotic Quo. Demonstration—Frut Salad.—Mrs. P. Tobin and others.

July.—Girls' Meeting. N. B. Early History. Literary men and statesmen. Paper—Table setting and serving.—Miss Turner. Samples of needlework.—Girls. Discussion—How girls can help their mothers. Demonstration—Ice Cream.—Mrs. I. Carson, Mrs. I. Carson, Mrs. J. Grant and others. Cake.—Girls.

Aug.—Picnic.

Sept.—Prophecy what the homes will be like when every woman attends the Institute.—Mrs. G. W. Flemming. Each a Suggestion—How to make an Institute Meeting instructive and entertaining. Discussion—Does the housewife work harder than the professional woman?. Vocal Solo.—Mrs. Carpenter. Jelly Making, Pickling, Preserving—All bring samples. Demonstration—Doughnuts—Mrs. G. M. Green.

Oct.—How to keep young.—Mrs. J. Y. Flemming. Simple meals, well cooked, nicely served.—Mrs. G. Sanderson. Discussion—Christmas presents. How to grow bulbs. Exhibition of needlework.—All. Demonstration—Angel Cake.—Miss L. Crabbe. Choice Cherry Wine.—Mrs. A. Henderson.

Nov.—Each member bring a man and a lunch. Discussion—Do farmers' wives work harder than their husbands?—Mrs. A. Henderson. Will better education tend to turn the boys and girls from the farm?—Mrs. S. Billings.

Dec.—Shall the wife have an allowance?—Mrs. Faucett. Discussion—The capricious appetite. Shall it be catered to? Soap. Laundry and toilet. Demonstration—Fruit Cake and Raspberry Wine.—Mrs. Blair and Miss Meagher.

The excellent results attending the Women's Inssitute work in every locality where an organization exists and the interest and earnestness which is taken in the work is sufficient justification for its continuance. Anything to be successful must be continuous and it is to be hoped that the Women's Institute work will receive the financial support and trained supervision which is necessary for its successful continuance.

It has been a great pleasure for me to have had part in the arranging of the First Annual Convention of the New Brunswick Institutes. The success of the Convention and the Institute work throughout the province is largely due to the members of the various branches.

We were fortunate in having Miss M. V. Powell, of Ont., present, an experienced and enthusiatic worker in the Ontario Institutes.

The five sessions of the Convention were well attended—members of Parliament, visitors in the city and a number of men were present at the different sessions.

FIRST ANNUAL CONVENTION OF THE NEW BRUNSWICK WOMEN'S INSTITUTES.

The first Annual Convention of the Women's Institutes of New Brunswick was held in the Y. M. C. A. building, Fredericton, on February 18 and 19. The Convention was a great success and marked the formal inauguration of the work in the province.

The first of the five sessions opened with 49 delegates present from nearly every country in the province. Twenty-three of these were Government delegates, others were sent by the Institutes while many took advantage of the excursion rates and came at their own expense for the sake of attending the Convention.

Mr. J. B. Daggett, Secretary for Agriculture, presided at the opening session. The Convention was opened by the singing of "O Canada" after which the Rev. Mr. Wilson led in prayer.

The Chairman: The Women's Institutes fill a social need in this province, particularly in the rural communities and I am pleased to see such a large and representative gathering present at the first Women's Institute Convention held in the province. Since taking up my duties as Secretary for Agriculture, I have been given an almost free hand by my chief, Hon. Dr. Landry in the handling of this part of the work.

This Convention has been called for the purpose of seeing just what strength and possibilities there were for the women's Institute work in this province and the future of the movement depended very largely upon the success of the Convention. Fundamentally he was not favorable to organizations which split up the women in one organization and the men in another. The fault lay with the men, who wanted to get together where they could smoke and often where they could discuss things which they would not like to talk over before their wives and daughters. The social movement in this province had made it necessary for the women to organize themselves. He would like to have the Government understand that the Department of Agriculture was heartily in sympathy with the work and would give consideration to any legitimate demand that was made.

ADDRESS OF WELCOME.

Mayor Hooper: In my year of office I have welcomed between ten and fifteen conventions, but this is the first gathering of women I have welcomed and this welcome which I give on behalf of the citizens is a hearty one.

I notice your program is a very interesting one and I believe when completed the Convention will be productive of much good.

I should like to see the ladies of the Women's Institutes confer with the management of the Fredericton Exhibition in making up the prize list for the September Exhibition for Domestic Science.

REPLY TO ADDRESS OF WELCOME.

Mrs. Medley Siddall, Pres. Port Elgin Institute:
Mr. Chairman:—

On behalf of the delegates of the Women's Institutes of New Brunswick I desire to thank Mayor Hooper for the very kind and cordial welcome extended to us.

This day is an unique one in the history of our province, in that it marks the time of an event of lasting importance, and from which should spread far-reaching results—the meeting of the representatives of an organized body of women who have at heart the betterment of home conditions, whose club motto is: "For Home and Country." Surely no Convention could have a more ennobling, more soul-satisfying purpose, or more practical common sense subjects for discussion than those that appertain to a higher standard of community life. Nor in any gathering of women could there be a closer unity existing, than exists in the assembly that meets for the discussion of subjects dealing with the home. For the home is more closely knitted to woman's heart than any institution, religious or secular, and there can be no division of feeling in matters that relate to the welfare of the home.

It is a fact, and if I were a woman suffragist I would consider it an argument in my favor, that women are only interested in moral questions, questions relating to the home and its occupants, questions bearing directly or indirectly on the home, or considered in relationship to the home.

In these stirring times we women have a greater independence of spirit than the women of a few years back. We cannot cling to the conditions of the past as did our mothers, and our unrest is not a manifestation of instability and idleness, but an eager striving for better methods of fulfilling our destiny of accomplishing our life's work. This delegation of women desirous perhaps of determining the best way to make a loaf of bread or bind up a bruised finger is but a manifestation of the desire for better citizenship, and we are beginning to learn too, that to wash a tumbler well is of greater service to society than writing a great treatise.

Our Women's Institute is but in its infancy. Our ideals are high, and our endeavors weak and seemingly ineffectual but we see "As in a glass darkly" the goal, efficient womanhood.

Mr. Chairman: I have much pleasure in moving a vote of thanks to Mayor Hooper for the cordial welcoming of these delegates of the Women's Institutes of New Brunswick.

ADDRESS.

Miss M. V. Powell, Whitby, Ont.: I wish to congratulate the Institutes on the admirable manner in which the work is being carried on. At this rate it will soon catch up to Ontario. I bring you greetings from 21,000 of the most intellectual women in Ontario, comprising the Women's Institutes of that province. Fifteen years ago the society was formed with only fifteen members, but since its inception the membership has steadily increased and to-day there are 21,000 united with one common object.

For many years in Ontario the Department of Agriculture has assisted the farmers to a very great extent and it is deplorable that not until fifteen years ago was the fact recognized that the women, too, needed help for the advancement of the interest of the home. The women stand equal with the men in their work.

This country needs education which stands for highest needs in the world, and the women stand for education. The Institute asks that the women be educated not away from their homes but in their homes and along lines that stand for the betterment of their homes. There is no greater national question than the home and it is necessary today that we fully understand the principles of life. Our motto and the motto of your organization as well is, "For Home and Country." Home is properly recognized as the first place. We, in our homes, are building there the future of our nation. Should they not have every training possible, every care and every thought? Should we not have the highest standards and how are we to have those ideals if the women have not the education and the development? Today there are so many demands upon a woman's time. Our Ontario organizations have provided for the women in the best possible way. The work grows because of the need as no other organization has done. Ontario has the largest women's organization on the continent. They all meet an one common ground, no sex, no creed. They meet in one common cause, which is the uplifting of our homes. Surely the object is a high one? To build up characters for the future citizens, it demands the thought of every intellectual man and woman. Only recently has it been conceded that women have ability to think. Women should keep in touch with all public questions in order that they might be able to provide for the young ones in the home. Women must take an intellectual interest in all public affairs. It will bind together much more closely the family ties because the women in the home understand his work and the care and difficulties which he has to meet in every day life. The Institutes of Ontario have met the need in regard to social life. We come in touch with other women of the community because of the Women's Institutes. It has not the narrowing effect of religious circles. In the Institute work we find theme for work which can touch the home. Nothing is too small or too great for us to undertake. Education forms a very great part of our work. The women are anxious to carry on the lines of work which are suggested to them through our Institute. They are receiving the support of every intelligent man in the community and all intelligent men aid these organizations. We accomplish our work by the co-operation of the men. The women needed the help of the stronger sex just as they needed the refinement and cultivation of the of the women. The whole national life is influenced by our women. The institute helps her to take a different view of her work. She is in touch with not only her own home but every other home.

We take up in the Institute the vital things of life. We are learning there that common runs of household, even the common talks and the ordinary tasks of the home take upon themselves a different aspect. Nothing is too small to do in the very best possible way that it can be done. Today it is necessary for the homemaker to know the science of her work. If a woman cannot learn self-control she cannot carry on the work of the home. We learn all these things in the Women's Institutes. It is particularly beneficial to those in rural districts. We do not claim for the organization publicity or drawing public attention, but our aim and object is to bring into the lonely, isolated life more brightness, more of the joy of living. Everything and anything in the home which tends to elevation, cultivation will tend to developing the home. The successful man requires a business training and how much more so is that training necessary for the woman in the home. It is the duty of the mother to train the boys and girls who would be the future men and women of this country and the influence that goes from the home is the influence that would control a nation. Should the women of Canada then not have the highest standard, the highest ideals of life? How can the women attain the highest standards if they do not have proper facilities.

There are 740 branches in Ontario and last year $7000.00 had been granted for Women's Institute work and the women, by their own efforts, had raised $30,000.00, making the total amount available the sum of $37,000. The surplus for 1912 amounted to over $14,000. The 740 branches in Ontario are visited by official delegates every summer and winter.

I understand that the Department of Agriculture of New Brunswick expended about $60,000 in agriculture, while only $1,500 was appropriated for women's work. Surely this is generosity on the part of the Government? It seems to me that when the great amount of work of the Women's Institute can accomplish, is recognized, that no doubt substantial means would be provided for the carrying on of the movement.

Among other matters which the Women's Institutes of Ontario have considered is the school question. We have done a great deal towards the solution of the school question. We are undertaking all through our province medical inspection through our schools. The schools need more than they are getting. We want to get down and do things, not talk about them. We want things which they will use in everyday life. In some schools they have what is called, "Mother Classes." They are taught how to care for the little ones. With us, we are endeavoring to have every Institute visit the school in the district once a month. They see that the conditions of the schools are beneficial to the pupils.

The standard of the home is the standard of the community. We are endeavoring to uplift not only the home but also the school. It rests very largely with us as to the standards of the community. In Ontario we are giving them the advantage of scientific training. The best homemakers are the ones who take up this work. For fifteen weeks one lesson a week is given for $1.00 in cooking, sewing and home nursing. Graduates are employed for this work. Three thousand dollars is used for the education of our homemaker. We hope that next year it will be ten thousand dollars to put the work in touch with a greater number of Institutes and to give it development

The whole matter of today depends upon the soundness of the boy today. We want to broaden out. Only by education can we make the proper advance. Through the Ontario Institutes halls have been built, circulating libraries introduced and almost everything has been done in regard to civic work. Many branches have undertaken the work of public parks and play-grounds for children. Ontario has taken up child welfare in almost every phase of its work. The Institute is undoubtedly recognized as a powerful factor in the development of the province.

New Brunswick affords a vast field for activity along women's line, and I trust that the next few years will be characterized by increased efforts towards the uplifting of the conditions of the home.

ADDRESS: PREMIER FLEMMING.

I have listened with a great deal of pleasure to the interesting, comprehensive and instructive address just given by Miss Powell.

I am here to express on my own behalf and on behalf of the Government the interest which we feel in the work of the Women's Institute. I believe that in a few days a bill is to be introduced in the Legislature providing for votes for women, so I desire to stand well with the women, particularly as they soon will be an added portion to the electorate of New Brunswick.

Great importance is attached to the co-operation of an organization such as the Women's Institute for the advancement of the province. I am satisfied that great good will result to the province through the work of the Women's Institutes. If the Institute carries on in any reasonable way its aims and objects, much good is bound to result. The motto of the Institute "For Home and Country" was an admirable one, and that itself enlisted the sympathy of every right minded citizen of the province. I have no sympathy with the man who is not true to his country, loyal to the church to which he belongs and there should be equal loyality to the home. What is a man worth who does not have the strongest feeling of devotion to his home, and where this organization is working for home and country, the work must appeal to every man and woman.

The work of the Women's Institutes must of necessity result in making the homes more attractive and more particularly the rural homes of the province. My sympathy is entirely with the man and woman in the rural community, in meeting the difficulties and in helping to solve the problems. I am interested in the condition of the rural home because I realize that the success of the city homes depends on the rural districts. The addition to the rural population would solve the question of prosperity, advancement and success of the cities, town and villages.

What the province needs is the need of more people to see the beauty of staying near to nature, of staying on the land and populating the rural districts. Surely the work of the Women's Institutes to make the work attractive, was one of the most potent influences to bring about this result.

The Government would co-operate in the work by endeavoring to give better highways, better educational facilities and more rural telephones. The isolation of the farm had caused a drift of many to the towns and cities and the principle of rural telephones was disturbing the monotony of farm life. I should like to see the telephone extended to every rural community in the Province. I am willing to help in every way possible to have our people see the advantage of staying on the land. The old saying that man made the city and God made the country is as true as it is old; a good deal that man had made had turned out to be counterfeit. Surely it is true that the earth is full of the goodness of God. I wish that my voice was strong enough to reach out to every citizen of New Brunswick and to impress them with the desirability of staying on the land and nearer to Nature's heart, rather than the passion and fashion of the city. The Institute could accomplish a great amount of good in showing our people that the farm was the best place to live, thrive and die.

I am interested in agricultural education, also in household or domestic science, and the Government proposes to bring the agricultural education nearer to the boys and girls of the Province. At the Agricultural Schools to be established at Sussex and Woodstock there would be well equipped departments in Household Science.

I am glad of the opportunity of attending the First Annual Convention of the Women's Institutes and I trust that the future will see an increased interest in this important work, so that when the next convention is held

(Continued on page 421)

Soil Characteristics.

The unit in the soil survey is the soil type, and each type possesses more or less definite characteristics. The line of separation between adjoining types is usually distinct, but sometimes one type grades into another so gradually that it is very difficult to draw the line between them. In such exceptional cases, some slight variation in the location of soil-type boundaries is unavoidable.

Several factors must be taken into account in establishing soil types. These are (1) the geological origin of the soil, whether residual, glacial, loessial, alluvial, colluvial, or cumulose; (2) the topography, or lay of the land; (3) native vegetation, as forest or prairie grasses; (4) the structure, or the depth and character of the surface, subsurface and subsoil; (5) the physical or mechanical composition of the different strata composing the soil, as the percentages of gravel, sand, silt, clay and organic matter which they contain; (6) the texture, or porosity, granulation, friability, plasticity, etc.; (7), the color of the strata; (8) the natural drainage; (9) agricultural value based upon its natural productiveness; (10) the ultimate chemical composition and reaction.

The common soil constituents are indicated in the following outline:

CONSTITUENTS OF SOILS

- Soil Constituents
  - Organic Matter — Comprising undecomposed and partially decayed vegetable material
  - Inorganic Matter
    - Clay .....001 mm.* and less
    - Silt.....001 mm. to .03 mm.
    - Sand ..... 03 mm. to 1. mm.
    - Gravel ..... 1. mm. to 32 mm
    - Stones ..... 32. mm. and over

*25 millimeters equal 1 inch.

GROUPS OF SOIL TYPES.

The following gives the different general groups of soils:

!Peats—Consisting of 35 percent or more of organic matter, sometimes mixed with more or less sand or silt.

Peaty loams—15 to 35 percent of organic matter mixed with much sand and silt and a little clay.

Mucks—15 to 35 percent of partly decomposed organic matter mixed with much clay and some silt.

Clays—Soils with from more than 25 per cent of clay, usually mixed with much silt and some sand.

Silt loams—Soils with more than 50 percent of silt and less than 15 percent of clay, mixed with some sand.

Loams—Soils with from 30 to 50 percent of sand mixed with much silt and a little clay.

Sandy loams—Soils with from 50 to 75 percent of sand.

Fine Sandy loams—Soils with from 50 to 75 percent of fine sand mixed with much silt and little clay.

Sands—Soils with more than 75 per cent of sand.

Gravelly loams—Soils with 15 to 50 percent of gravel with much sand and some silt.

Gravels—Soils with more than 50 percent of gravel.

Stony loams—Soils containing a considerable number of stones over one inch in diameter.

Rock outcrop—Usually ledges of rock having no agricultural value.

More or less organic matter is found in nearly all the above classes.

SUPPLY AND LIBERATION OF PLANT FOOD.

The productive capacity of land in humid sections depends almost wholly upon the power of the soil to feed the crop; and this, in turn, depends both upon the stock of plant food contained in the soil and upon the rate at which this is liberated, or rendered soluble and available for us in plant growth. Protection from weeds, insects and fungous diseases, though exceedingly important, is not a positive but a negative factor in crop production.

The chemical analysis of the soil gives the invoice of fertility actually present in the soil strata sampled and analyzed, but the rate of liberation is governed by many factors, some of which may be controlled by the farmer, while others are largely beyond his control. Chief among the important controllable factors which influence the liberation of plant food are limestone and decaying organic matter, which may be added to the soil by direct application of ground limestone and farm manure. Organic matter may be supplied also by green manure crops and crop residues, such as clover, cow-peas, straw and cornstalks. The rate of decay of organic matter depends largely upon its age and origin, and it may be hastened by tillage. The chemical analysis shows correctly the total organic carbon, which represent as a rule, but little more than half the organic matter; so that 20,000 pounds of organic carbon in the plow-soil of an acre correspond to nearly 20 tons of organic matter. But this organic matter consists largely of the old organic residues that have accumulated during the past centuries because they were resistant to decay, and 2 tons of clover or cowpeas plowed under may have greater power to liberate plant food than the 20 tons of old, inactive organic matter. The recent history of the individual farm or field must be depended upon for information concerning recent additions of active organic matter, whether in application of farm manure, in legume crops, or in grass-root sods of old pastures.

Probably no agricultural fact is more generally known by farmers and landowners than that soils differ in productive power. Even though plowed alike and at the same time, prepared the same way, planted the same day with the same kind of seed, and cultivated alike, watered by the same rains and warmed by the same sun, nevertheless the best acre may produce twice as large a crop as the poorest acre on the same farm, if not, indeed, in the same field; and the fact should be repeated and emphasized that with the normal rainfall of Illinois the productive power of the land depends primarily upon the stock of plant food contained in the soil and upon the rate at which it is liberated, just as the success of the merchant depends primarily upon his stock of goods and the rapidity of sales. In both cases the stock of any commodity must be increased or renewed whenever the supply of such commodity becomes so depleted as to limit the success of the business, whether on the farm or in the store.

As the organic matter decays, certain decomposition products are formed, including much carbonic acid, some nitric acid, and various organic acids, and these have power to act upon the soil and dissolve the essential mineral plant foods, thus furnishing soluble phosphates, nitrates, and other salts of potassium, magnesium, calcium, etc., for the use of the growing crop.

As already explained, fresh organic matter decomposes much more rapidly than the old humus, which represents the organic residues most resistant to decay and which consequently has accumulated in the soil during the past centuries. The decay of this old humus can be hastened both by tillage, which maintains a porous condition and thus permits the oxygen of the air to enter the soil more freely and to effect the more rapid oxidation of the organic matter, and also by incorporating with the old resistant residues some fresh organic matter, such as farm manure, clover roots, etc., which decay rapidly and thus furnish or liberate organic matter and inorganic food for bacteria, the bacteria, under such favorable conditions, appearing to have power to attack and decompose the old humus. It is probably for this reason that peat, a very inactive and inefficient fertilizer when used by itself, becomes much more effective when incorporated with fresh farm manure; so that, when used together two tons of the mixture may be worth as much as two tons of manure, but if applied separately, the peat has little value. Bacterial action is also promoted by the presence of limestone.

The condition of the organic matter of the soil is indicated more or less definitely by the ratio of carbon to nitrogen. As an average, the fresh organic matter incorporated with soils contains about twenty times as much carbon as nitrogen, but the carbohydrates ferment and decompose much more rapidly than the nitrogenous matter; and the old resistant organic residues, such as are found in normal subsoils, commonly contain only five or six times as much carbon as nitrogen. Soils of normal physical composition, such as loam, clay loam, silt loam, and fine sandy loam, when in good productive condition, contain about twelve to fourteen times as much carbon as nitrogen in the surface soil; while in old, worn soils that are greatly in need of fresh, active, organic manures, the ratio is narrower, sometimes falling below ten of carbon to one of nitrogen. (Except in newly made alluvial soils, the ratio is usually narrower in the subsurface and subsoil than in the surface stratum.)

It should be kept in mind that crops are not made out of nothing. They are composed of ten different elements of plant food, every one of which is absolutely essential for the growth and formation of every agricultural plant. Of these ten elements of plant food, only two (carbon and oxygen) are secured from the air by all agricultural plants, only one (hydrogen), from water, and seven from the soil. Nitrogen, one of these seven elements secured from the soil by all plants, may also be secured from the air by one class of plants (legumes), in case the amount liberated from the soil is insufficient but even these plants (which include only the clovers, peas, beans, and vetches, among our common agricultural plants), secure from the soil alone six elements (phosphorus, potassium, magnesium, calcium, iron and sulphur), and also utilize the soil nitrogen so far as it becomes soluble and available during their period of growth.

Plants are made of plant-food elements in just the same sense that a building is made of wood and iron, brick, stone and mortar. Without materials, nothing material can be made. The normal temperature, sunshine, rainfall, and length of season in Central Illinois are sufficient to produce 50 bushels of wheat per acre, 100 bushels of corn, 100 bushels of oats, and 4 tons of clover hay; and, where the land is properly drained and properly tilled, such crops would frequently be secured if the plant foods were present in sufficient amounts and liberated at a sufficiently rapid rate to meet the absolute needs of the crops.

CROP REQUIREMENTS.

The accompanying table shows the requirements of such crops for the five most important plant-food elements which the soil must furnish. (Iron and sulphur are supplied normally in sufficient abundance compared with the amounts needed by the plants, so that they are not known ever to limit the yield of general farm crops grown under normal conditions.)

TABLE A.—PLANT FOOD IN WHEAT, CORN, OATS AND CLOVER

Produce		Nitrogen	Phosphorus	Potasium	Magnesium	Calcium
Kind	Amount	pounds	pounds	pounds	pounds	pounds
Wheat, grain	50 bu.	71	12	13	4	1
Wheat, straw	2½ tons	25	4	45	4	10
Corn, grain	100 bu.	100	17	19	7	1
Corn stover	3 tons	48	6	52	10	21
Corn cobs	½ ton	2		2		
Oats, grain	100 bu.	66	11	16	4	2
Oat straw	2½ tons	31	5	52	7	15
Clover seed	4 bu.	7	2	3	1	1
Clover hay	4 tons	160	20	120	31	117
Total in grain and seed		244*	42	51	16	4
Total in four crops		510*	77	322	68	168

*These amounts include the nitrogen contained in the clover seed or hay, which, however, may be secured from the air.

To be sure, these are large yields, but shall we try to make possible the production of yields only half or a quarter as large as these, or shall we set as our ideal this higher mark, and then approach it as nearly as possible with profit? Among the four crops, corn is the largest, with a total yield of more than six tons per acre; and yet the 100-bushel crop of corn is often produced on rich pieces of land in good seasons. In very practical and profitable systems of farming, the Illinois Experiment Station has produced, as an average of the six years, 1905 to 1910, a yield of 87 bushels of corn per acre in grain farming (with limestone and phosphorus applied, and with crop residues and legume crops turned under), and 90 bushels per acre in live-stock farming (with limestone, phosphorus and manure.)

The importance of maintaining a rich surface soil cannot be too strongly emphasized. It is well illustrated by data from the Rothamsted Experiment Station, the oldest in the world. Thus on Broadbalk field, where wheat has been grown since

THE TEST OF EDUCATION.

The employer, whatever his line of work, asks the applicant for a job; "What can you do?" he doesn't ask "Where did you go to school? Did you graduate? Can you translate Caesar's wars, work problems in trigonometery, or describe the difference between the government of ancient Rome and that of Persia?" The one question is, "What can you do?"

If the applicant can show that he can pull off his coat and go to work at the job assigned, or at some useful job the employer may have, there is a chance for the applicant to earn his bread and butter. Otherwise he must tramp along in quest of a place where the inefficient, the unskilled, the impractical may find an opening.

The test of education is fitness for work. The better the education the better the job.

Do your children get fitted for life work in the country schools, or in the town schools for that matter? Can the eighth grader or those who finish country school go out into the world and earn a living by means of the knowledge and skill he may have acquired in school? Can he, after he has been through high school? If so, blessed be that family within range of such a school!

The school statistics show a very decided tendency in American homes to educate the children outside the public school walls. Why? Because nearly everybody is well aware that after the child has learned to read and write and figure a little he can get more practical schooling on the farm or on the streets than in the school room. It has been discovered that the schools do not fit the pupils for real life—do not give the training that enables them to go out and earn a living.

Would the boy become a clerical man in town—he must go to a private business college. Would the girl become a stenographer—she must go to the private school to learn. Would the boy become a carpenter, an artisan in any line—he must go to the technical school or apprentice himself to that line of work and work out his own salvation. Would the farm boy know the principles of agriculture—he must dig them out by the slow and uncertain process of mixing home study with field practice. Would the farm girl get the fundamentals of domestic science—she must go to a school where such things are taught.

The test of education is fitness for service. That fitness should come by aid of the public schools below eighth grade and largely finished off in the high school.

PROFIT IN KINDNESS.

Too few breeders and dairy farmers give the needed recognition to the basis on which the dairy industry is founded—the motherhood of the animal furnishing the milk. One of the most successful of the early Wisconsin dairymen had for his motto, "Speak to a cow as you would to a lady;" and then he was asked if he removed his hat when entering the stable in the morning, he replied that he certainly would do so if he thought he could get more milk thereby.

What owner, especially in testing, has not noticed that some one of his milkers was able to get more milk from the cows than were the other milkers? It is the personal equation, the regard the cow has for her attendant, that gives hand milking an advantage over the machine; and the more nearly the cow has adopted her milker in the place of her calf, the greater will be his success as a milker. There is usually a vast difference in results between the milker who gets a cow into position by pushing the leg of the stool into her flank and then kicks her on the shin to make her step back, and the one who gains the same end with patience and gentleness. Who can blame the cow for wanting to kick the first man?

Aside from the knowledge of how to feed in general and the study of the special wants of the individual cows, to attain the greatest success a man must win the affection of the cows. Some will say that this cannot be done. But if the calf and growing yearling is treated gently and kindly, and then is stabled and handled before freshening like a cow, there will be no such thing as breaking the heifer to milk; she will take it as the regular thing.

If a person desires to install a music box in the stable, it may be that it will work all right; but the less of singing, whistling and loud talking there is, the better it will be. Indeed, talking of all kinds except the low spoken, soothing words of the milker to the cow should be prohibited. When you see a cow that is fastened loosely enough at the neck reach around and affectionately lick her milker as she would her calf, you may know that that man will get all the milk anyone can get.

Motherhood and milk production go together. Treat the cow like a mother. Be kind; be gentle; it will pay and pay big.

ASK THE CROPS.

Way up in the mountains of Pennsylvania, at State College, fertilizer experiments have been carried on since 1882 the longest period recorded in the United States, although Ohio is a very close second. In every case the humus content was kept up by the turning under of hay or clover, as of course roots and stubble were carefully conserved to keep up this most important item of soil fertility. Many curious variations in results obtained with mineral fertilizers or chemical compounds were found. Difficult to explain, although our farm and experience demonstrates conclusively that the let-up in crop increase is most frequently caused by the acidity resulting from the continued use of chemicals without any attempt to counteract this with the use of sweeteners like lime. This was likewise demonstrated in Pennsylvania by the fact that the very valuable plant clover, was replaced by the very unwelcome plant sorrel. The increase in crops grown by varying treatments of soil were as follows:

The use of but six tons of manure (produced on the farm as it should be), applied at the cost of $1.00 per ton, amounting to $16.92, over the yield of land which received nothing. Where phosphoric acid was applied increase was $5.32 above the cost; where potash, $11.38, and where both phosphoric acid and potash with nitrate of soda were used, the increase was $10.93. Anyone blessed with just everyday average powers of thought and observation will at once recognize the fact that man has not yet solved the wonderful and perplexing problem of the one best method of keeping up soil fertility and securing the greatest returns for the least expenditure. All practical workers in the crop raising field, whether they are fortunate possessors of high-class agricultural education or merely possessors of an education secured by continuous reading and contact with others successfully pursuing the same profession, found long ago, that there was one absolute necessity. Upon this, among men who really know, there never has been one bit of argument. The one item is that in any rotation, whether its duration be three or more years, there must be at least the plowing under of heavy sod, if no other means are used to keep up the vegetable matter or humus in the soil

Regarding the proper amount of chemical fertilizers to be used and the proportion in which they are to be mixed, the government and the states are so wide apart that they astound and frequently seriously perplex and upset those following the great out-door profession as a producer of animal income. So to those who live in the Maritime Provinces we again say that all the world, scientists and successful laymen are unanimous in agreeing that the use of manure, the turning under of green crops or heavy sod, is an absolute necessity for upholding the soil to its maximum capability of crop production and that there is but one way for each soil tiller to find whether or no chemical fertilizers are necessary, what quantity should be used and what particular form of phosphoric acid, potash or nitrogen yielding salt will enable him to secure an increase in crops sufficient to pay for the purchase and application of any chemical or mineral matter. That different men, with different methods will obtain different results is a foregone conclusion and as this will continue until the end of time, as it has continued from the beginning thereof, only side by side plots or acres handled by the same men using different fertilizing materials will ever prove whether barnyard manure, cover crops or heavy sod are the best basis for his particular individuality and conditions, and whether or not the purchase and application of minerals or chemicals of any description will prove a money maker, a money loser or an even split. As Prof. Stewart puts it. "Ask the crops."

SMALL LINES OF GUMPTION.

Keep well to your own natural gait; don't worry anything about keeping up with, or a little ahead of, your neighbors and you are sure to hold out in the race a good deal better.

If you have quit paying attention to the chirp of the sparrows and are no longer charmed with the glories of the summer sunset, it is probable that you are working too hard, or that your mind is burdened with a greater load of selfish ambition than it ought to bear.

The men who think that they are slaves to their work are in a very poor way to become master of it.

Some fools try all the advice they receive, and others try none of it.

When one meets a farmer who runs down everyone's methods but his own, run away just as quick as courtesy will permit.

Some men are so hard set in their ideas that they have to be revolutionized every time they take a step in advance.

Some men always talk about the weather, no matter what it may be, in exactly the voice of the rain crow.

There is something in ears; a cornfield with big ones is always generous.

Aviation continues to be a dangerous occupation; it isn't even safe to take a flier on the market.

Grabbing the steering wheel when another is driving the car is an act of the same fool who grabs the lines when another is driving the team.

A joy ride for the farmer is on the spring seat of the wagon carrying to market a load of hogs when the price is at the top notch.

A young fellow can't discover the way to improve upon his old father's methods by gazing through the bottom of a bottle.—M. G. Rambo.

BUSINESS MANAGEMENT.

One farmer will fail to get ahead and the neighbor next to him will succeed. The land is the same, the climate identical, the opportunities equal. But one loses time and money because of bad management of fields and buildings and by a lack of system in his farming. He keeps cows that do not pay; has more horses than he needs; grows the wrong kind of crops.

The neighbor makes every lick count and insists that all stock shall more than pay their way. Instead of a lot of idle geldings he has sufficient brood mares that give him a paying by-product. He has pulled up the fences and re-arranged the fields so he has the least amount of travel to and from, the least waste space, and has moved his buildings so they are convenient.

In other words, one man is a business farmer and the other is not. One has studied his farm and his farming with a view to get the most net profit from it.

Are you rushed from sun up to dark, from early spring to late fall so that you never have time for recreation and pleasure? Maybe it is not so much the lack of help as the lack of system.

Women's Institute of New Brunswick.

(Continued from page 418)

here there will be a larger attendance of delegates who had the vision of the possibilities of the Women's Institutes and the desire to carry out the work as it had been outlined.

ADDRESS: MR. H. W. WOODS, M. L. A.

I wish to congratulate the members of the Women's Institutes on the success that has characterized the opening of the First Annual Provincial Convention.

I have been very much interested in the remarks of Miss Powell, who has certainly taken a different stand from many of the other speakers who have come to this Province from Ontario. It was an old standing joke that Ontario speakers usually think of nothing but Ontario, but Miss Powell has words of appreciation of the energy displayed in the condition of the work in New Brunswick and made valuable suggestions for the advancement of this important department.

Like the Premier, I am familiar with the advantages of Household Science and I am able to appreciate the practical results of having the knowledge of how to prepare a good steak.

While Miss Powell has outlined a large and extensive program for women's work, the Institute must not expect to accomplish everything at once, but by carrying out a few important measures each year the desired results would soon be achieved. I am in hearty accord with the work of the Institute and will give any assistance I possibly can towards its advancement.

I am sure that the Premier, like myself, was impressed with the business-like methods that prevailed, and I am confident that Hon. Mr. Flemming will see his way clear to increase the grant for this important work.

ADDRESS: HON. DR. LANDRY, MINISTER OF AGRICULTUUE.

I am here in the name of the Government to welcome the delegates to Fredericton and to express my appreciation of the work in which you are engaged. You may rest assured that you have the sympathy of every member of the Government and I believe of every member of the Legislature, irrespective of party affiliation. In your endeavors for the advancement of the conditions of the homes and the amelioration of the numerous troubles and ills of life, the Institute should have the hearty co-operation of all thoughtful people. It is for this reason that the Department of Agriculture took such an interest in women's work, and had established the Women's Institutes.

New Brunswick is not the first Province to take up women's work and establish these organizations. Institutes have been in existence in Ontario for fifteen years, and it was claimed that the people of that Province found the work of such value that the statement was made that no other organization had done so much for the upbuilding of the individual, the community or the nation. I believe that the women of this country, although christian and civilized, did not exercise the beneficial influences that they might, and I am pleased to see the marked interest being manifested in the new departments for the advancement of women's work. By having Women's Institutes in the various section of the Province and the annual Convention, the women are enabled to know one another better and through the discussion of the various matters of interest that would necessarily arise, the years to come would undoubtedly find results that are not felt today. I am glad to note that so many subjects of vital importance are included in the program of the Convention. The training of children has been one of the matters discussed, and there is no more important subject than the bringing up of young people. Canada is a young country, making immeasurable progress, and if she is to attain the greatest development it is necessary that the young generation should be properly trained, because the time will soon arrive when they will have to shoulder the duties and responsibilities of our country. Any influence can be carried to the country by teaching that influence to the younger generation. The ancient history of the Spartans and Athenians affords a striking illustration of what results can be obtained through the education of children. By educating the second generation the Athenians had been able to defeat the Spartans. If the people of New Brunswick gave their children the proper education they would be able to obtain any reasonable results from them. The children form the family, the family forms the community and the community forms the nation. As the children shall be trained so shall the family be trained, and as the family shall be trained so shall the nations be trained. I trust that the women of the Institute will study this question thoroughly and bring new facts to bear on it year by year.

I believe tnat I am safe in saying that New Brunswick has one of the best educational systems in the world, and in substantiation of the statement I wish to remind you that about fifteen years ago a commission was appointed by the Government of South Africa to visit America and study the educational system in vogue. Not only did the commission investigate the educational systems of Canada, but also those of the United States, and my proof for making the statement that New Brunswick's system is a splendid one, was that the commission after giving careful thought and attention to the matter, decided that the educational system of New Brunswick was the best of all they had visited. Therefore, it is not my intention to decry the system but I want to point out that some school buildings are totally inadequate. In some sections the buildings are dark, dreary and cold. The desks are not proportionate to the size of the pupils. That condition of affairs afforded scope for the efforts of the Women's Institute. My experience with the women has been that if they want anything they are going to get it. I strongly urge the women to discuss these matters and give their assistance to the authorities in reaching a solution of them.

There should be closer connection between the home and the school. Parents in some cases were not in sympathy with the teachers instead of co-operating with them in the education of their children. The school surroundings might be beautiful to a large extent, while other improvements are also desirable.

I am very anxious that you continue your good work. I am very much in sympathy with the movement and trust that the work in the different sections will be vigorously prosecuted. Trained ladies are necessary, carrying scientific training in Food values and Cooking, Domestic Art and Home Nursing, to the rural districts. Earnestness and perseverance will undoubtedly bring material results, and I have no doubt that as a result of the labors of this Institute there will be better home-keeping and a higher status of community life in this Province in the years to come.

The Convention closed by the singing of the national anthem.

Miss Powell presided at the last session. Several reports were read by the Institute delegates present.

Miss S. Waycott, of Fredericton, gave an instructive talk on "Business methods for Women" and many points were brought out of much value.

MATRON OF HOSPITAL, FREDERICTON.

Mrs. Richard's paper on "The Value of Pure Air, Sunshine and the Bath" contained much practical information.

Mrs. Thomas Bullock, Pres. Local Council of Women, addressed the Convention on the work of the Local Council and spoke of affiliation with the Institutes, as in the other provinces.

Miss Thorne, of Fredericton, gave a very instructive talk on "Vocational and Liberal Education" which was most attentively listened to by all.

Miss Powell conducted a Model Institute meeting showing the delegates how much more can be accomplished by following methods in the regular monthly meetings.

The following resolutions were passed by the Convention:—

Mrs. M. G. Siddall, of Port Elgin, on behalf of the delegates, moved a vote of thanks to Miss Daisy Harrison, the acting Supervisor, and to the Department for the excellent arrangements which had been made for the Convention.

It was moved and seconded that Miss Daisy E. Harrison, of Gondola Point, who has so successfully carried on the superintendency of the work in New Brunswick during the past two months be continued as Supervisor for the next year.

The Convention was closed by the singing of "God Save the King."

WELSFORD BRANCH.

RESULT OF THE INSTITUTE IN OUR COMMUNITY AND REPORT.

Previous to the visit of Miss Daisy E. Harrison and Miss E. E. Smillee in September last, we had in Ford's Mills a small band of workers, the proceeds of their sales going towards an Agricultural Hall (for some few years there has been a splendid Agricultural Society whose membership is still increasing). At the conclusion of their meeting the ladies explained what the Women's Institute was and wished us to organize, when it has explained to them what the band of workers were working for. They told us all we should have to do was to change the name of our society from "The Ladies' Aid" to "Women's Institute," and elect our officers. For different reasons this was not done that day, but receiving the address of the Supervisor, Mrs. Dunbrack, I wrote for rules and regulations and she was kind enough to loan us her office copy.

On the eve of October 9th, we organized. Since then we have had three monthly meetings and one Executive meeting, and our membership list is twenty-six, including officers at time of organization.

We began an Autograph quilt, making somewhere nearly 100 paper blocks. We sent these to friends in various places. Up to the present time only 42 blocks have been returned, which has netted us $42.55. At time of organization we had $10.00 on hand, result of a Dime Social. With this we started two sewing clubs (as the homes of our members are greatly scattered, covering an area of 10 miles), meeting once in two weeks. On Xmas eve we held a Basket Social at which we realized the sum of $48.70. We are quite proud of the financial result of the Institute so far.

Regarding papers, etc., got up and read, they have been on various subjects. Some readings were on work done in other Institutes and how they were conducted, to get in touch with Institute work.

Our meetings have simply been of a social nature and "Institute Night" is looked forward to with great interest and enjoyed by all. We usually have a number of visitors with our members.

When Miss Harrison learned that I was delegate from "Weldford Branch Institute" she wrote and asked me to give our report under the heading of "Result of the Institute in our Community." As you will know, our Institute has been so recently organized it is somewhat difficult to write on the "Result." However, we feel that it has prompted a sociability in our community as nothing before has done, each member alike having the same interest in the Institute and its work. What we seem to lack is self-confidence in each member. No cooking demonstrations have been given as each think, "Woman is a born cook and no one knows as much as another." However, we trust to greatly improve our Institute in the future and ask help from Institutes older than our own, which will encourage each member to do her utmost to make "Welsford Branch" a splendid success in the years to come.

We thank the Department for Government grant, which came last week.

Yours very truly,
Mrs. John Cail,
Ford's Mill, N. B.

Lime and Clover.

In this abundance of talk on the use of lime on land, it is well for us to establish certain well known principles in our minds to start with.

1. That we should not use burned or quick lime, unless thoroughly air-slaked, because of its caustic property whereby it eats up the humus or vegetable matter in the soil thus robbing it of its best nitrogen holder.

2. That our main object should be to use lime in order that we may increase the capacity of our land to grow clover or alfalfa.

On these two plants we must depend for a proper rotation, for through them we increase the nitrogen in the soil. Once get our land to producing abundant and sure crops of clover or alfalfa, then we have the key, with proper management, to further enrichment of the land. Hence we should use the ground limestone or marl first of all for the purpose of growing clover or alfalfa. If we keep these principles and objects in mind we will be sure not to go wrong. It used to be said: "Everything is possible on the farm that can grow clover abundantly." There's the secret of the uplift of our land. We get our crops from the combined use of manure and turned under clover and it is the limestone that helps to establish the clover.

Advantage of Drainage.

The advantage of drainage is not limited to carrying away the excess of water. It prevents the accumulation of stagnant water in the soil and deepens the soil for the work of roots, thus assisting to prevent the evil effects during the periods of drought. The soil is also rendered much warmer, while the penetration of the air brings oxygen to the vegetable and mineral matter in the soil, hastening chemical reaction. When a field is tile-drained, it can be plowed a week or ten days earlier than the wet places, which enables the crop to get a better start in the first stages of growth.

The use of commercial fertilizers is often advisable on thin land, but care must be taken to see that there is vegetable matter in the soil in sufficient quantity to insure results with the fertilizer to compensate for poor preparation, inadequate cultivation and lack of humus.

HORTICULTURE.

Fruit Growers at Sheffield Mills.

A meeting of the fruit growers was held in Bligh's warehouse at Sheffield Mills on Friday, Feb. 28th. Although the day was stormy a goodly number were present, and attentively listened to what was said and illustrated on the spraying question.

Mr. F. G. Newcombe, as chairman, in a short speech called the meeting to attention, stating its object, and informing the growers that it was not for the benefit of the individuals in presenting this power sprayer, but more for the good and profit of the growers—the growers got all the profit. Capt. C. O. Allen was then called, who mounted the top of a power sprayer (s very appropriate spot to talk spraying from) and stated that owing to the storm, some of those who were slated to speak, had not arrived, and in order to commence the meeting would read a few extracts from letters received from some of the most reliable growers throughout the valley. Following are extracts from the various communications. C. R.Grafton, says in brief: "Sprayed thoroughly and had as clean a lot of apples as could possibly be expected for a 1912 season. One young orchard did not spray; picked 45 barrels and took them to the canning factory, lost enough in this orchard to pay for spraying entire orchard." A. S. Banks, Waterville, says: Out of 661 bbls. 327 of which were Gravensteins, got 73 p. c. ones; 15 p. c. twos; 12½ p. c. threes. Lime-Sulphur is better than Bordeaux. There is a great gain in the quantity of fruit a tree can mature, because of the improved condition of the foliage of trees sprayed with Lime-Sulphur over those whose growth is checked with Bordeaux or fungus growth." W. B. Burgess, Kinsman Corner says: Last season used 7 casks Lime-Sulphur with splendid success. Book me for 15 casks next season. Apples keep fine, pack 10 No. 1's and 2's to 1 No. 3. Care and good power sprayer can produce perfect fruit with Lime-Sulphur. D. H. Sarsfield, Kingston, says: "Our pack to Jan. 1st, is 491 bbls; 274 No. 1's, 97 No. 2's, 120 No. 3's. Have more Baldwins than any other variety, and as it was in this my loss was, had I sprayed Aug. 1st, would have averaged over 80 p. c. No. 1's. Result is a lesson to me. Will do more through spraying and also thinning, as I have proved that in this, lay the best paying operations of the fruit industry." George E. Hutchinson, Berwick, says: "Used Lime-Sulphur past two seasons with good results. Have heard it said that a light application was as good as more. For fungicide it requires strong solution and drench trees well. If not mixed properly and applied thoroughly, might as well stay in the house."

Capt. Allen then remarked that there was no doubt but that a lot of growers near at hand had obtained just as good results, but had not made it known. The speaker said that F. M. Chute, Mgr. Waterville Fruit Co., gave his permission to use the following record from one member who had raised 1500 bbls: Out of 400 bbls. Gravensteins, had packed 4 barrels No. 1's. The whole lot of this sort only netted him 55c. per barrel. Out of 100 barrels Spies did not get a barrel of No. 1's. Out of whole season's crop did not pack 100 barrels No. 1's. Mr. Chute considered the man lost over $1,000 by not spraying. The Captain went on then and said that the government had a man lecturing in Annapolis Co., who is exhibiting a statement on canvas showing the results of how all the mebers of the United Fruit Co's Gravensteins packed out in comparison with 7 of the best spraying members in the Berwick Fruit Co., which works out as follows: Loss to the companies on 57,780 barrels, $27,734. Assuming the United Fruit Co's handled half the crop, the aggregate loss to the valley by insufficient spraying on Gravensteins alone this season has amounted to over $55,000.

Manning Ells, Secretary of the N. S. F. G. A., then took the "power" stand and made some crisp and trite spraying statements. There are three essentials in spraying: Proper time, proper material and proper manner. Had always found Lime-Sulphur an excellent spray, giving splendid satisfaction. The power sprayer was a great advance in improved conditions, and through it spraying could be accomplished satisfactorily and at the proper time. It is a profitable investment.

At the meeting it was both asserted and proved that the Duplex power sprayer was by far the best power sprayer on the market. Several fruit growers in the valley had purchased other outfits, without the agitator, and are now applying to and buying from the Niagara Spray Co. for outfits and agitators to put in their old gears in order to keep the arsenate of lead and Lime-Sulphur thoroughly mixed, which is one of the most essential features of a power sprayer. —N. A. W. in Kentville Advertiser.

Consider the Strawberry.

Editor The Maritime Farmer:—

As a profitable farm crop, it is hard to beat the strawberry and this especially applies to Nova Scotia. Two factors count in reckoning the profit of a crop;—cost of production, and price received from the finished product. In cost of growing we compare favorably with any place in Canada; and the want of available labor at picking time, is the only drawback. The price received for the crop is equalled only in the far West, and is far ahead of that received by the growers in Ontario.

In conversation with Ontario fruit growers, I have learned that if they can sell by the season at five cents per box they are well satisfied. Nova Scotia growers net from eight to twelve cents F. O. B. cars, and as yet have not raised enough to nearly fill the demand. The prices paid by consumers in the manufacturing and mining towns in Cape Breton for native strawberries per box, is about the same as they pay for a pound of butter, or a box of chocolates; and thousands, because of this price cannot afford to eat this most delicious of nature's foods.

Without a doubt there is a home market for double and treble the quantity we are producing to-day; and at good paying prices, if they were handled and distributed in a proper manner. In berry growing districts in the South the farmers have united and are selling and distributing their crops through co-operative agencies the same as apples are handled in the Valley with great profit to themselves and immense benefit to the consumer. Berry growers should be almost ready for some such organization here. At the present time nine-tenths are sent on commission to Halifax, and so as a result we soon have a glutted market and low prices. The small towns should receive more attention; for every one eats strawberries if they can get them, and in the aggregate these small places consume a wonderful amount. As our farms are all small comparatively speaking, no one is safe who depends altogether on one crop. Where apples are the principal money crop, a great deal of attention must be given the orchard in the spring; and whatever is raised to supplement this, must not compete for attention at the same time. This is one of the reasons why the growing of potatoes has been given up by so many orchardists; one or the other was bound to suffer.

Orcharding and strawberry growing go hand in hand; the strawberry crop being harvested just after the last cultivation is given the orchard, and the cover crop sown. At this time of the year, too, the apple grower's finances are apt to be at a pretty low ebb so the proceeds of his berry field will arrive at just the right time. Any kind of land is suitable for growing berries if it is well drained; however, a light loam or a sand loam is to be preferred. Do not plant on an old sod that has been ploughed down; this rotted sod is almost sure to be the nursery of the larvae of the June bug, or the white grub as it is called, and it is very fond of the roots of the strawberry plants. The June bug lays its eggs in old pasture swards or anywhere that the sod has been undisturbed some years without ploughing. It is not safe to set strawberry plants for three years after this sod is broken up. In preparing the land plow in about sixteen two-horse loads of barnyard manure to the acre as early as the land is fit to work in the Spring, or the fall before. Harrow thoroughly and then firm the surface with a heavily weighed roller or planker. Mark off in rows three and a half feet apart with a marker and set the plants twenty-four inches in the row. Try to have the land ready and plants set before they have started growth in the Spring, or while they are still dormant. This is very important if a good stand is wanted for after the plant has begun to put out its leaves it is a great check to its growing system to transplant it. I prefer to add what commercial fertilizer is needed to supplement the manure after the plants have been set about a month, and just as they are beginning to grow nicely. In most soils not much potash is needed; about two hundred pounds of murate containing one hundred pounds actual potash should be sufficient for an acre. This can be applied when harrowing or later. For the phosphoric acid and nitrogen I mix five hundred pounds acid phosphate and one hundred and fifty pounds nitrate of soda on the barn floor and sow along the rows on top of the young plants when they are perfectly dry, then it will not burn the leaves. This amount is for one acre and, as I said before, I like to put it on when the plants are beginningto grow nicely. This fertilizer is very soluble and when the next hoeing and cultivation takes place mix it with the soil, the plants are able to lay hold of it immediately. It is wonderful to see how in a few days they will seem to almost double in size, and take on a rank, healthy color. On the other hand, this soluble fertilizer is sown broadcast and harrowed in; before planting it is likely to be leached from the ground by heavy rains before the plants are strong enough to lay hold of it. Hoeing and cultivation must not be neglected if profitable results are expected. As a commercial proposition I would say: hoe four times and cultivate with the horse six or eight. If the land is very weedy you will need to give them more attention than this, but remember no crop will pay for this extra cultivation more than the strawberry, and a big, full-crowned, healthy plant is storing up strength to carry a bumper crop the following year. Keep a path between the rows free from plants and small runners if possible, that the pickers can work without getting on the vines. In this country with our changeable winter weather and after nate thawing and freezing it is necessary to mulch. Oat straw is as good as anything, using about two tons to the acre. Marsh hay, swamp hay, or

Mill Work

Mr. Mill Man

get your mill repair work done by the Sussex Manufacturing Co. We are fully equipped for all kinds and can guarantee satisfaction. Orders will be promptly attended to.

We also manufacture Trimmers, Mill Rollers in all sizes, Arbors to order, Smoke Stacks, Frictions, Wood Pulleys split or solid, Boxes in all sizes, Flanges, Set Collars, Couplings etc.

HOW TO CONQUER RHEUMATISM AT YOUR OWN HOME

If you or any of your friends suffer from rheumatism, kidney disorders or excess of uric acid, causing lameness, backache, muscular pains; stiff, painful, swollen joints, pain in the limbs and feet; dimness of sight, itching skin or frequent neuralgic pains, I invite you to send for a generous **Free Trial Treatment** of my well-known, reliable **Chronicure**, with references and full particulars by mail. (This is no C. O. D. scheme.) No matter how many may have failed in your case, let me prove to you, free of cost, that rheumatism can be conquered. **Chronicure** succeeds where all else fails. **Chronicure cleanses the blood and removes the cause.** Also for a weakened, run-down condition of the system, you will find **Chronicure a most satisfactory general tonic that makes you feel that life is worth living.** Please tell your friends of this liberal offer, and **send today** for large free package, to **MRS. M. SUMMERS, Box S. 309—Windsor, Ont.**

FOR YOUR BATH

SNAP

It imparts a delightful glow of vigorous health to the skin and leaves it smooth and soft. Keep your kiddies' knees and hands clean with SNAP. It does the work.

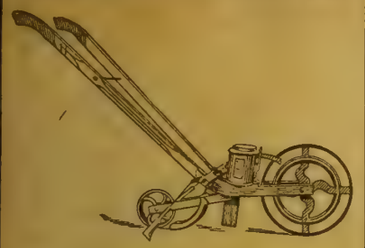
Dr. de Van's Female Pills

A reliable French regulator; never fails. These pills are exceedingly powerful in regulating the generative portion of the female system. Refuse all cheap imitations. **Dr. de Van's** are sold at $5 a box, or three for $10. Mailed to any address. **The Scobell Drug Co., St. Catharines, Ont.**

GARDEN SEEDERS



Our **seeder** has years of success behind it and with improvements recently added, makes it without a doubt the best machine of the kind on the market.

The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup. **The flow of seed** can be instantly stopped by a **swinging cut-off** operated by a chain attached to the handle. This prevents any loss of seed at the end of the row.

The marker is held firmly in place and is easily adjusted. **The covering wheel** is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. **The main wheel** is high with a wide rim which keeps it from sinking into the soft earth.

Each year finds the demand for our garden seeders greatly increased. No better **seeder** can be built for accurate and fast sowing of **turnip, cabbage, sage, carrot, onion, parsnip, spinach, beet, pea, corn** and all other kinds of **garden seed.**

Every machine carries our **absolute guarantee.**

Say I Saw It in The FARMER

any cheap litter can be used, however. Do not apply heavily or the plants will smother and rot. All that is needed is to shade the ground and it should be put on after the frost has made everything solid and you can drive on the field without injury. Do not disturb this mulch in the spring but allow the plants to come up through it. The straw will keep them moist and the berries clean; often in a dry season this mulch makes the difference between a fair crop and no crop at all. For the commercial grower the question of varieties is an important one, and one who sells plants can always tell the amateur by the number of varieties in his order. We have extra early, early, medium, late, and very late as descriptions in Nurserymen's Catalogue; but after being in the business a while we soon learn that they do not vary in time of ripening as much as we were led to expect.

I have never seen an earlier berry than the "Senator Dunlap" that could be classed as a market berry and it hangs out with the best of them on light land. On heavy soils the "Sample" seems to be the most popular but it is considerably later and never catches the twenty cent market.

S. B. Chute, of Berwick, who has probably been in the game as long as any one in the Valley and grows from four to five acres a year raises the "Dunlap" exclusively.

In Pereaux where the soil is much heavier and they have no frosts the "Sample" is the money maker with some other varieties like the "Dunlap" for a pollenizer. At picking time all preparations must be made in advance; boxes and crates on hand, etc,, for this crop will not wait. pickers should be engaged and some arrangements made to hold them all through the season. A cent a box is the usual price paid, and if a bonus is offered of a quarter or a half a cent extra to all who come every picking day you give your pickers an incentive to stay by you. One picking neglected means soft berries and unsatisfied customers all through the rest of the season.

Five thousand boxes is a good crop for an acre but three thousand is nearer what is usually harvested. Much larger yields than this are common, however, running up as high as twelve thousand boxes but at the lowest figure there is a good profit, for the expense including labor should not exceed one hundred and fifty dollars which would leave at average prices received, one hundred and fifty dollars clear.

That our fruit growers are not taking advantage of their opportunities considering the market and returns is evident. Our young men who are looking at the green and distant fields with longing eyes might do well to investigate these opportunities that are laying right at their doors.

At one time in Australia farmers built their fences of stones that were filled and loaded with gold never dreaming of the treasures laying all unnoticed at their feet.—M. K. E.

Sprouting Seed Potatoes.

Experiments were carried on at 322 centres in Ireland, in 1911, to test the effect of sprouting seed potatoes before planting. Taking the average results for the different countries, the increase in yield per acre due to sprouting varied from 12 cwt. in Co. Dublin to 2 tons 19 cwt. in Co. Carlow. The average results of similar tests carried out in the last nine years show that in about a thousand tests the average increase in yield due to sprouting was 2 tons per acre.

More profit per acre

HOW ?

Manufacturers have found that their costs per unit of production whether it be a pair of shoes, a machine or a yard of cloth, are reduced by increasing the output of the factory. The same principle applies on the farm. Increasing the yield per acre reduces the cost per bushel, thus making more profit. Increased production chiefly depends on increased available fertility which is obtained by the use of high grade fertilizers.

BOWKER'S

Bowker's Fertilizers are high grade and available. They are active, sure, and well backed by forty years of experience, the best of materials and facilities and prompt service. A suitable fertilizer for every crop and adapted to every pocketbook.

We want Agents in unoccupied territory. Write today for prices and terms; this may mean a good business for you if you act at once.

Write anyway for our illustrated catalogue and calendar before you buy your spring fertilizer. We want you to know what we can do.

DAIRYING.

Selling Holsteins on Their Merits.

Editor Maritime Farmer.

We are pleased to report the most prosperous year since we began breeding Holsteins, some 25 years ago. I will give you a list of our sales for the last couple of months, which will give you some idea of the extent of the demand for Holsteins.

To Glassburn Agricultural Society we sold Cobequid Helbon Donald, a son of Helbon DeKol's Prince and Blanche La Honda a grandson with a record of 76 lbs. milk per day and above 60 lbs. per day for over three months.

To Toney River Agricultural Society went Cobequid Helbon Lad. This is a fine deep-bodied son of old Lilac, well known in the dairy test at Amherst. Lilac made over 15000 lbs. milk in one year.

To Illsley Bros., Somerset, Kings Co., N. S., we sold Vida's Snowball Prince, a bull of fine type and exceptional breeding. His two nearest dams averaged over 20,000 lbs. milk and 820 lbs. butter in 1 year, both entered in Canadian R. O. P.

To Wm. J. Gibson, Marshfield, P. E. I., we sold the most promising young bull we have handled for some time. His two nearest dams average over 25½ lbs. butter in 7 days. Their milk averaged 4.15 per cent. fat. Mr. Gibson bought him to head his herd of pure breds and we will be badly disappointed if this bull does not make a name for himself in his hands.

Prof. Stevenson, of the N. S. A. C. purchased Artis Rosie, the first prize cow and Cobequid Rooker LaHonda, the first prize three-year-old at Amherst Winter Fair. The Prof. tells what a bargain he got. However, that does not hurt us any.

Mr. John C. Chisholm, Lower South River, Antigonish Co., got De Kol Jewel 3rd, a regular machine for making milk. In a recent letter, Mr. Chisholm states that she gave 2,029 lbs. milk in January, and she had been milking for six weeks previously.

Mr. Geo. Hunter, East Fairville, N. B., got the heifer calf Cobequid Helbon Polly. Her dam, Cobequid Rooker Polly made the most milk of any heifer in the yearling class in test at Amherst.

To R. L. Parker, Waterville, Kings Co., we sold a fine bull out of Daisy, the heifer that scored highest in the two-year-old class at ehe Fair in 1911.

The Fertilizer Experimental Farms, Ltd., Sydney, C. B., are starting a herd of Holsteins and for a foundation they took Aggie Emily, a five-year-old cow with official records at four years of 18.60 lbs. butter in 7 days and at 2 years and 1 month she made 14.6 lbs. in 7 days, also a fine two-year-old, Cobequid Helbon Lottie. Both of these cows were in calf to Royalton Canary Mayor, whose dam has an official record of 34.6 lbs. butter in 7 days and 111 lbs. milk in one day at four years old. They also got Cobequid Helbon Ida with heifer calf at foot sired by Mayor. We venture to say that this is the best bred bunch of Holsteins that have changed hands in the Maritime Provinces for some time.

Mr. R. R. Wannamaker, of Nauwigewauk, N. B., while attending the short courses, bought Cobequid Helbon Polly, third prize yearling at Amherst, 1912. This is a very promising heifer and if she has a chance she will make the best step sonie. He also bought Cobequid Helbon May, a fine two-year-old from Miss LaHonda, the first prize three-year-old and highest scoring cow at Amherst in 1911. We expect to officially test Miss La Honda soon and look for a good record. C. H. May was in calf to Royalton Canary Mayor. This is probably the best heifer we ever sold and it took a good figure to move her.

Mr. P. L. Morse, Berwick, N. S., a former student at the N. S. A. C., got Cobequid Helbon Posch. This is a fine, stylish, breedy looking bull with record breeding, being sired by Helbon De Kol Prince and from a daughter of Cornelia's Posch, three times champion at Toronto and the sire of a number of high record cows.

To Mr. S. C. Clark, Cape Traverse, P. E. I., goes the bull, Cobequid Helbon Duke. His dam is Cobequid Rooker LaHonda, first prize three-year-old at Amherst in 1912.

Walter S. Dickie took with him to British Columbia six fine, young cows, among them were Cobequid Orne Belle, reserve junior champion at the Dominion Exhibition, at St. John. Orne Rooker Posch, a grand cow that won first prize in two-year-old class in dairy test in 1910. She milked 61 lbs. per day as a two-year-old, and over 75 lbs. as a three-year-old. He also took Cobequid Bessie Posch, third prize two-year-old at dairy test in 1912.

Nearly every inquiry we get asks for the records and it is getting plainer every day that the people want the cows that can produce.

We expect before very long to have young bulls sired by Royalton Canary Mayor. The first calves sired by him are just arriving now and we must say that we are well pleased with them.

Samuel Dickie & Sons.
Central Onslow, N. S.

June Butter in February.

Editor Maritime Farmer.

When we decided to carry on a side line of farming and keep a cow or two, we fully made up our minds that there should be absolutely clean milk from the beginning such as was delivered to us in bottles at New York by the Borden and Campbell people. Milk with black settlings or any other kind of sediment for that matter was to be tabooed. The first important step was to secure a sanitary milk pail. We looked up Ads. in the agricultural papers and wrote one firm in the United States. Circulars came announcing that the price would be four dollars at the factory. That, with duty and expressage, seemed prohibitive and smacked of graft. Another advertisement with a cut of a pail stated the price openly as two dollars. That was certainly better, but as this latter pail was made in the United States also, it would involve duty and some considerable expressage. So I cut out the picture of the pail and took it to a local tinsmith and from the design he produced an honest article that should wear for years, weighing with the cover complete four pounds. It is made of the heaviest tin plate, having a close fitting cover with a strainer (with a rim around it) so that the milk is strained before it enters the pail. Another strainer at the spout strains the milk again as it is poured out of the pail.

I neglected to say that previous to milking, the cow's udder and teats were washed carefully with warm water. There were no settlings in this milk, not even once; it had the flavor of milk and not of cow.

The tinsmith continued making these pails and is making them now of the same quality, a perfect article, at $1.50 each. They are getting to be quite popular, he says, especially with up-to-date people, and the people at the creamery think they are "all right."

Now, as to June butter in winter. Since early in Febraury our milk has been principally from an Ayrshire

What The Dealer Can Show You

GO and see the Standard cream separator at our agent's in your locality. It will strike you as being a handsome compact, convenient-looking machine.

First appearances will delight you. And naturally you'll want to know more about the

Standard

You'll want to hnow why it has earned the title of "The World's Greatest Separator." Our dealer will be glad to show you.

He will show you the low supply can. You will smile cheerfuily when you notice that it is over one foot lower than the supply cans on ordinary separators. The high and awkward lifting of a pailful of milk are banished with the Standard.

Then he will get you to step over and turn the crank. You will see right away that you don't have to do any back-breaking stooping. The Standard eliminates that, by having the crank shaft four inches higher than on other separators.

Easy to Clean

Next he will show you the wide open bowl. You will observe that there are no milk or cream tubes to clog up. And the discs, on a special disc holder, can all be washed in a minute. If your wife is present, this feature will make her happy.

And when you are looking at the discs, the dealer will call your attention to the unusually wide open space between the discs and the bowl. This space accomodates the impurities in the milk and prevents the discs getting clogged. It means absolutely clean cream and no waste.

He will next direct your attention to the fact that the only visible moving part of the separator is the crank, the gearing being entirely enclosed, which banishes all danger of the children getting clothes caught or fingers crushed should they venture to touch the machine when it is running.

Self-Oiling System

He will ask if you can find any grease cups or glass lubricators on the machine. You can't, because the Standard hasn't any. It's self-oiling system automatically supplies the working parts with a continuous bath of oil. And the oil cannot drip on to the floor and be wasted either.

He will show you--but we've not the space here to tell you all you'll see. But we've a catalog that describes the Standard very fully. Also a folder entitled "Skimming Results," which gives what we believe are world's records for close skimming accomplished by the Standard. If you cannot conveniently visit the dealer write for this catalog and folder. Of course, you'll want them right away, so mail us a card or letter promptly.

T. W. BOYD & SON,
27 Notre Dame St. West, Montreal.

cow, which is rather lighter in color than that from the grade Guernsey, so we used a little Wells & Richardson's butter color, and that, with the sweet, creamy taste of clean milk, is the finishing touch in the making of June butter in February, and completes the illusion. The deduction is that the sweet flavor of June butter is due, not only to the fresh, new grasses of that time of year, which add both flavor and color, but much to the fact that the cows are cleaner when in the pasture than when they are in the stable expecially when not carefully bedded. The open pail does the rest in destroying the flavor of winter butter.

Of course, there are other important factors in making butter in winter or summer. The milk must be kept at the right temperature and care should be taken to avoid developing the bitter bacteria, especially in winter. When the lactic acid culture is properly developed, it is safer to insure its succession by adding a little of the buttermilk containing it to the first of the next lot of cream intended for the churn. We find that if the churn is placed on the back of the range shortly before time to churn and the cream slowly heated to a temperature of 65 degrees Fahr. the butter will come after from ten to twenty minutes' churning—and this with an old-fashioned stoneware churn and ordinary dash. To insure the butter keeping sweet and creamy, be sure to work out all the buttermilk. It is not necessary to wash the butter. Cleanliness and a little science is the whole secret. If the government could enforce sanitary measures in the handling of milk, our creameries could do themselves better justice, and the public would be better served with good milk and better products. —G. Campbell Creelman, Yarmouth, N. S.

Cow-Testing Associations.

Editor Maritime Farmer.

Much has been said and written about dairy herd improvement but this very important matter cannot be too strongly emphasized. Throughout the development of dairy cattle in years past improvement has been brought about through breeding and selection carried on by men who have worked with a definite end in view. We must bear in mind that the function of the cow in her natural state was solely to maintain herself and to produce enough milk to feed her calf. She has been taken out of that natural condition and developed into more or less of a machine; a machine the function of which is to consume food in its crude state and manufacture that food into milk from which we may make cheese and butter. The dairy cow has, therefore, been raised to a comparatively high standard of culture and the natural tendency is downward. This tendency must be counteracted by careful breeding and management on the part of the dairy farmer.

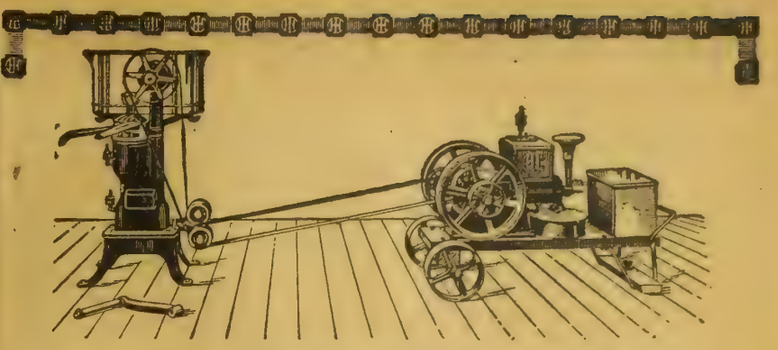
We have in New Brunswick a great many cows which do not pay for their feed; cows which are simply boarders on the owners hands or, in some cases, eating up the profit made by good cows. The first step which must be made in the improvement of our dairy herds is selection. As a means of making this selection we have the work of the Cow Testing Associations.

Such an association is composed of men who agree to keep records of their cows. This involves the weighing of the milk from each cow at both milkings on at least three days each month, e. g., 10th, 20th and 30th and the taking of samples at the same time the weighing is done. These samples are preserved till the end of the month and then tested by the Babcock test for the percentage of butter-fat. Each man must furnish himself with a spring scale, 70c. to $1.25; a sample bottle for each cow, 4c. each; and a sample dipper. The Dairy Division agrees to furnish all record sheets, preservative tablets for preserving the milk, sulphuric acid for testing and to pay for having the testing done at the rate of 5c. per test each month.

In sections where there are cheese or butter factories we have them as natural centres of an association and the samples may be brought in at the end of each month to be tested. In other sections where there are no factories it is quite possible to make other arrangements regarding the testing.

When information has been obtained regarding the amount of milk produc-

(Continued on page 449)



Cream Separator Savings

AN I H C cream separator saves money for you in more ways than most people know. It saves cream because it skims practically all the butter fat out of the milk. It saves on the feed bills. Calves and pigs thrive on the sweet, warm skim milk that comes fresh from the separator. It saves fertility. The dairyman who feeds the skim milk to animals parts with a very small amount of fertility. The man who sells whole milk loses close to $4.80 per cow per year in fertilizing matter. These three savings, while not all that a cream separator makes, are important enough to warrant the most thoughtful consideration.

I H C Cream Separators

Dairymaid and Bluebell

are also furnished as complete power outfits, as illustrated above. The engine is a one-horse power, back geared, hopper-cooled, I H C engine which can be detached and used to run any small machine. The separators are built for long life and skimming efficiency. They have heavy phosphor bronze bushings for bearings; a never-failing splash oiling system; trouble proof bowl spindle bearings; dirt and milk proof spiral gears which are easily accessible for cleaning. There are four convenient sizes of each style. Ask the I H C local agents who handle these machines for demonstration. Get a catalogue and full information from them, or, write the nearest branch house.

LIVE STOCK.

The True Situation Re Tubercular Cattle on the College Farm, Truro, N. S.

In the House of Assembly at Halifax, in the course of a discussion of the agricultural policy of the Government, Mr. Howard Corning, member for Yarmouth county, took occasion to inquire into the methods pursued by the Agricultural College at Truro, in order to insure absolutely healthy stock being distributed through the country.

In the report of the Secretary for Agriculture for Nova Scotia, the farm superintendent, L. S. Stevenson, states that he has placed the herd under the Bangs system, according to which calves are at birth, removed from their dams and reared under conditions where there is no possibility of their developing tuberculosis or any other disease which the dams might happen to have.

From a persual of Mr. Carning's speech one might derive the idea that the college management had not adopted as rigorous methods as should be adopted. We ourselves, knowing the calibre of the men at Truro felt sure that any such reflection was not in accord with the methods of these men and we, therefore, interviewed Dr. J. Standish, the college veterinarian in regard to the matter.

From him, we learned that the college management had decided to put the herd of cows under the Bangs system and had accordingly, under his direction tested them.

They made public announcement of this, the Principal himself stating both in letters and viva voce from the platform the facts and ordering that, until he was absolutely satisfied as to the condition of the herd, he would not allow a single animal to be sold for breeding purposes until July 1st next.

To show how thorough the management were, Dr. Standish added "Mr. Stevenson under my direction recently tested a part of the herd with tuberculin, supplied from the office of the veterinary Director General, at Ottawa, not a single individual reacted. Had we been satisfied with this, the test, that would ordinarily have been the only one applied, we could say to the public that there is not a single reacting cow in the herd. However, the principal was anxious that the matter be further investigated and asked to have the herd tested with tubercilin secured from another source. The result of this test was that some of the cows that passed under the Ottawa tuberculin test, reacted under the Parke Davis tuberculin test. Now it does not necessarily follow that, because they reacted, therefore they are tuberculous. Moreover, if they are tuberculous, the test gives no idea as to the nature or extent of the infection. But, in order to keep absolute faith with the public, the Principal has done just what anyone who knows him would expect him to do, viz., assume that these animals are tuberculous and segregate them from the rest of the herd and raise the calves under the Bangs system as described above."

The Doctor added that "Dr. Torrance, the Veterinary Director General, had personally thanked the principal because of the thorough methods pursued at Truro which gave him possession of facts that would lead him to inquire into the quality of the tuberculin which was being used."

In writing thus, we do not cast any reflections upon that most efficient officer for every one knows that products of organic life, like tuberculin, are not absolute and that there is always a danger of their lacking virility. If, however, all testing were only done as carefully and efficiently as it was at Truro a better control than is ordinarily possible could be kept on tuberculin testing.

In conclusion we may say that in so far as Mr. Corning's speech was for the purpose of enlightening the public, as the Principal and the other members of the college staff had previously been doing, it will serve a useful purpose. For the public should be better posted than they they are on the whole subject of tuberculosis. The fact that it is estimated that from 15 to 30 per cent. of the cattle of Canada will react to the test and a much larger proportion of the cattle of some of the older countries shows that everyone should be on their guard. We hope this was as far as Mr. Corning purposed. In so far, however, as his speech may have unwittingly cast reflection upon the efficient college staff, we think he should take pains to ascertain all the facts and let the public know them.

Castration of Lambs.

The advantages of flockmasters of emasculating lambs has been thus summarized by Professor Shaw, of the Ontario Agricultural College, Guelph. He states that (1) lambs will increase more rapidly in weight when castrated than when reared as rams. This is more particularly true after the procreative powers become capable of performing their functions. It is true for the reason that when the energies of the system act in one direction, as in meat-making, better results may be looked for than when they act in two directions, as in meat-making and procreation. The former is the condition of the castrated animal, and the latter of the uncastrated. (2) Meat-making is arrested in the uncastrated lamb by a condition of unrest which is entirely absent in the castrated animal, and more particularly during the breeding season. All breeders and feeders know very well that a restful condition is essential to the highest success in meat-making. (3) It is much more convenient for the feeders to handle lambs in the castrated than in the uncastrated form. It is impossible to feed ram and ewe lambs together in the winter, as the ewes would become pregnant, which would be fatal to well-doing as meat producers. Many feeders, in Guelph district, purchase their lambs in the leading live stock centres, and they naturally reject consignments in which uncastrated rams are mingling with the ewes. He gives the following reasons, among others, why the consumer cannot afford to pay so much for the uncastrated lambs:—(1) The quality of the meat is inferior. In rams, and, in fact, in all uncastrated males, there is a tendency to development of strength of bone. Because of this the proportion of bone to the meat is unduly large. (2) There is undue development of the inferior proportions of the carcass, as the head and neck. A butcher who retails a carcass of mutton cannot get nearly so good a price relatively for these inferior portions, hence he cannot afford to give so much for the same. (3) The meat is also inferior in flavor. There is a rankness about it not found in the carcass of castrated lambs, and this so far detracts from its flavor. More especially is this true in the breeding season. Castration should take place at an early age in the life of the animal.

A Good Record.

Canadian Cereal & Flour Mills, Ltd.
TORONTO, ONT.

THIS WASHER MUST PAY FOR ITSELF.

A MAN tried to sell me a horse once. He said it was a fine horse and had nothing the matter with it. I wanted a fine horse, but, I didn't know anything about horses much. And I didn't know the man very well either.

So I told him I wanted to try the horse for a month. He said "All right," but pay me first, and I'll give you back your money if the horse isn't all right."

Well, I didn't like that. I was afraid the horse was'nt "all right" and that I might have to whistle for my money if I once parted with it. So I didn't buy the horse, although I wanted it badly. Now, this set me thinking,

You see I make Washing Machines—the "1900 Gravity" Washer.

And I said to myself, lots of people may think about my Washing Machine as I thought about the horse, and about the man who owned it.

But I'd never know, because they wouldn't write and tell me. You see I sell my Washing Machines by mail. I have sold over half a million that way. So, thought I, it is only fair enough to let people try my Washing Machines for a month, before they pay for them, just as I wanted to try the horse.

Now, I know what our "1900 Gravity" Washer will do. I know it will wash the clothes, without wearing or tearing them, in less than half the time they can be washed by hand or by any other machine.

I know it will wash a tub full of very dirty clothes in Six Minutes. I know no other machine ever invented can do that, without wearing the clothes. Our "1900 Gravity" Washer does the work so easy that a child can run it almost as well as a strong woman, and it don't wear the clothes, fray the edges, nor break buttons, the way all other machines do.

It just drives soapy water clear through the fibres of the clothes like a force pump might.

So, said I to myself, I will do with my "1900 Gravity" Washer what I wanted the man to do with the horse. Only I won't wait for people to ask me. I'll offer first, and I'll make good the offer every time.

Let me send you a "1900 Gravity" Washer on a month's free trial. I'll pay the freight out of my own pocket, and if you don't want the machine after you've used it a month, I'll take it back and pay the freight too. Surely that is fair enough, isn't it.

Doesn't it prove that the "1900 Gravity" Washer must be all that I say it is?

And you can pay me out of what it saves for you. It will save its whole cost in a few months in wear and tear on the clothes alone. And then it will save 50 to 75 cents a week over that in washwoman's wages. If you keep the machine after the month's trial, I'll let you pay for it out of what it saves you. If it saves you 60 cents a week, send me 50 cents a week 'till paid for. I'll take that cheerfully, and I'll wait for my money until the machine itself earns the balance.

Drop me a line to-day, and let me send you a book about the "1900 Gravity" Washer that washes clothes in six minutes.

Address me personally;
E. O. MORRIS, Manager 1900 Washer Co'p'y.
357 Yonge Street, Toronto, Can.

cow, Nettie McDonald, No. 4258, that we think is one of the largest fat records yet made in the Maritime Provinces. While it is only a semi-official record, as the Government inspector tested her on the farm on six different occasions during the year, it is not accepted in record of performance on account of a premature birth, eight months after beginning of test. But for this accident, which was caused by an over-gorge of frozen roots, which sickened the cow and put her badly off her milk, this record would be considerably greater. She lost the calf on November 3rd, and was again bred and conceived on November 27th, so she was in calf during nearly the full period.

Nettie McDonald is only a medium-sized Holstein and never ate over 16 lbs. meal in a day at any time and never was forced or fed more than twice a day. At the time of the inspector's visit in March, according to the prices charged cows entered in the official record test she was producing milk for fifty-six cents per hundred pounds. But, according to our prices, the cost was about seventy cents. However, she at all times produced milk most economically and well and at the provincial exhibition milk test, eight months after calving, she gave 34 lbs. milk testing 4.3 per cent. fat, in one day.

Her best month's milk record was in March, 1,785 pounds testing 3.6 per cent. Her best month's fat record was in May, 66 pounds, testing 4.0 per cent. She gave during the year 14,538 pounds milk, testing an average of nearly 4.1 per cent. butter fat, a total of 590 pounds fat.

Her total cost of feed was $112.00 and her butter and skimed milk was worth almost $200.00 at our prices making a profit of $88.00. In this calculation we priced everything at just what it was worth in the line of feed at market prices and the butter at the current prices. The skim milk was valued at 25 cents per hundred.

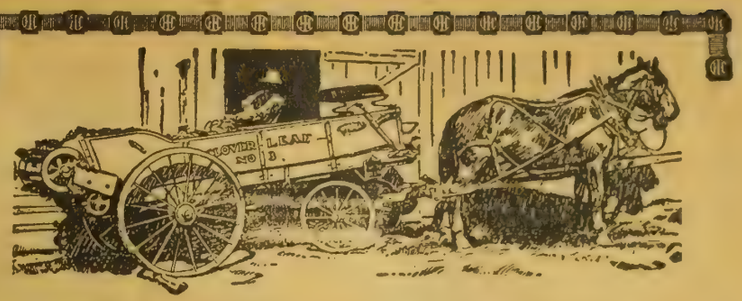
Barley as Hog Feed.

Subscriber asks:—"What is barley worth a bushel to feed hogs at $7.00 to $8.00 per cwt. live weight? If bran and shorts are recommended as good cheap feed at $1.20 to $1.30 per cwt., would not No. 2 and No. 3 wheat mixed with barley or oats, and ground, be just as good or better and cheaper when the price of No. 2 wheat is 64 cents per bushel?"

This is a question of very general interest, and a great many experiments have been conducted on this very point. In order to make our figures as fair as possible, we will take the average results of four very complete experiments in feeding barley chop to hogs. At Ottawa it was found that it required 435 pounds of barley chop to produce 100 pounds of gain; at Ontario Agricultural College it required 456 pounds; at South Dakota experiment station 458 pounds and at Wisconsin state college 471 pounds. An average of these widely separated stations gives us 455 pounds to produce 100 pounds of gain.

Allowing that hogs are worth $7.00 per cwt., this makes 455 pounds of barley worth $7.00, or a bushel (48 pounds) worth 73½ cents.

The latter part of the question raises a valuable suggestion. Barley should never be fed alone for best results. It is composed of a very high proportion of carbohydrates (fat and energy producing constituents) as compared with protein (flesh producing constituents), and as such is an unbalanced ration in itself. The most economical method of feeding barley, therefore, is to mix with it some of this cheap wheat. By so doing the feeding value of barley could be increased to considerably more than 73½ cents per bushel.



An Unsolicited Testimonial

A CLEAR-EYED young farmer stepped up to a manure spreader demonstrator at the 1912 Chicago Live Stock Exposition and, pointing to one of the spreaders in the exhibit said:

"I own one of those machines. It is the strongest spreader I ever had on my farm, and I've had a number of different machines. I honestly believe that if I filled that spreader with soft coal it would spread the stuff for me. I wouldn't trade it for any spreader I ever owned or saw."

This unsolicited recommendation from a man who had used an I H C spreader, and therefore knew what it would do, carried weight with his hearers. They might have doubted whether an I H C manure spreader would spread soft coal—but there was no doubt in their minds that an I H C spreader had spread manure to this man's entire satisfaction. This is a typical case showing what users think about

I H C Manure Spreaders

Corn King and Cloverleaf

I H C manure spreaders are made in many sizes, running from small, narrow machines for orchard and vineyard spreading to machines of capacity for large farms. They are made with either endless or reverse aprons as you prefer.

The rear axle is placed well under the box, where it carries over 70 per cent of the load, insuring plenty of tractive power at all times. Beaters are of large diameter to prevent winding. The teeth that cut and pulverize the manure are square and chisel pointed. The apron drive controls the load, insuring even spreading whether the machine is working up or down hill, or on the level. I H C spreaders have a rear axle differential, enabling them to spread evenly when turning corners.

The local agents handling these machines will show you all their good points, and will help you decide on the one that will do your work best. Get literature and full information from them, or, write the nearest branch house.

THE HORSE.

New-Born Foals.

It is estimated that some 25 per cent. of the annual foal crop is lost. Most of this mortality might be prevented by treating the mare intelligently and giving proper attention to the navel and bowels of the newborn foal. It is the purpose of this article to furnish practical instruction on these matters for the guidance of those having the charge of brood mares and foals.

NAVEL AND JOINT DISEASE.

The navel cord (umbillicus) connects the foal's body with the afterbirth (placental membranes) of the mare. It is made up of gelatinous tissue covering a large vein coming from the foal's liver and carrying impure blood to be purified in the lungs of the mare; two arteries carrying pure blood from the arteries of the mare, by way of the placenta, to the arteries of the foal, and a tube (urachus) from the foal's bladder which, while the colt is in the womb, discharges urine into one of the envelopes (allantois) covering the foal.

When the navel cord breaks at birth its blood vessel and tube promptly close, if all goes well. If pus-forming germs from filthy or soiled bedding, floor, or ground, get on to the raw navel cord, however they cause infection, inflammation and collections of pus at the point involved and thence germs are carried into the system and form colonies (secondary abscesses) elsewhere in the body, and notably in the joints of the extremeties.

In cases of generalized infection (pyaemia) abscesses may be found in the liver, kidneys, lungs, brain, muscles and subcutaneous connective tissue. If the urachus fails to close, urine dribbles or streams from the navel opening, and, in that event abscesses of the joints eventually appear, the infection having become general. The latter condition is termed "pervious" or "persistent" urachus. A majority of infected foals die. Recovery is seldom perfect. The colts fail to thrive or develop perfectly and are apt to have chronic affections of the joints. Treatment of the disease can only be properly conducted by the trained veterinarian, and he may employ a special (antistreptococcie) serum with some degree of success, both as a preventive and curative agent.

Seventy-five per cent. of the cases of this disease affect foals during the first three weeks of life. Fat, flabby often the get of overfed, pampered, underexercised stallions, or from mares in like condition—are especially prone to the disease and are most likely to succumb. Foals that have small navel cords and are lively at birth, soon on their feet and nursing, are much less liable to attack.

Stallions should be worked, or abundantly exercised, and so fed and maintained as to ensure virality, vigor, stamina, robust constitution and the perfect health of every organ. Mares should be similarly treated. Foals will then be likely to come into the world healthy, lively and strong to resist disease.

SYMPTOMS.

A few days after birth the foal is found to be weak, lame, feverish and with impaired appetite. One joint, or another, is swollen, hot and painful. Usually the attack affects the fetlock, hock, stifle hip, knee, elbow or shoulder. Sometimes abscesses form at the poll, about the ribs, or along the spinal column. The swellings rapidly increase in size and several joints are effected at one time. There is swelling of the navel, and pus oozes from one or more openings. Pus forms in quantities in the affected joints. Diarrhoea usually comes on, or may be alternated with constipation. Soon the foal is too weak to stand, loses appetite entirely, and dies in a few days, or in two or three weeks, in lingering cases. Often urine escapes from the navel, or the foal passes bloody urine; but the latter symptoms may, for a time at least, be present without noticeable symptoms of pus infection.

THE PREGNANT MARE.

The mare in foal should be worked lightly or abundantly exercised every day. Exercise is absolutely necessary. She should occupy a roomy box stall. Here she will take some additional exercise and will not be afraid to lie down. She will be less likely to become "cast" and escape having "stocked" legs and dropsical swellings of the udder and abdomen. The bedding should be kept clean and dry.

Feed the mare sound, whole oats, bran and mixed or timothy hay. Avoid moldy hay or silage, damaged grain, woody, weathered fodder, dusty or rusty straw, or hay containing ergot. Keep pregnant mares out of corn stalk fields. Provide them with plenty of pure, cleanwater. In working mares avoid jerking, severe pulling, wading through deep mud, manure piles or snow drifts. Let the work be light, easy and steady. Keep the bowels active by feeding bran and a little flaxseed meal, carrots, or some sweet silage.

The mare goes 48 weeks, or about 340 days with foal. As foaling time approaches decrease the grain ration and increase laxative foods to keep the bowels acting freely. Constipation is dangerous. When wax forms on the teats, about three days before foaling, stop working the mare and place her in a prepared box stall where she can be watched until the foal is born.

After foaling, leave the mare alone for a time, if she is laying down. If she does not expel her afterbirth promptly when she rises from resting inject into her womb one half gallon of luke warm 1 per cent. solution of coal tar disinfectant, or other mild antiseptic. If the afterbirth then does not come away within an hour or two it should be removed by hand. An expert should be employed for this operation and when it has been performed the womb should again be flushed out with an antiseptic solution. Half an hour after the birth of the foal, or about that time, offer the mare a pailful of luke water and again at intervals of two hours. Mares are thirsty at this time and should be abundantly supplied with water. An hour after foaling the mare may eat a mash of steamed oats and bran, if she has been accustomed to such feed; otherwise give her a small feed of her ordinary grain ration. In a few days, if the weather is fine, the mare and foal may take some out-door exercise

TESTIMONIALS

DEAR SIR :--I had a mare which had a very bad cough and heaves for almost six months, and become so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR :--I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contractions of the hoof.

W. A. C. RANDALL, M. D.

MESSRS FRASIER THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable

(Signed) WALTER SLATER, "Cash Livery."

Clydesdales--Showyard Versus Sale Types.

I have been interested in Clydesdales for almost forty years, and when I cast my mind back over those years I feel I have seen many changes in connection with the breed. My earliest recollections take me back to the days of the daughters of the celebrated Drummore Victor. These were big, roomy-bodied mares, with short legs, clean flat bones, first-rate feet and pasterns, strong as lions, and alike famed for their tempers and work. They were, in my opinion, typical Clydesdale mares. They were readily picked up, and many of them became the foundation of studs from which great, big, handsome horses possessed of substance and quality were bred. In those days one never heard of such a thing as constitutional weakness, of which we hear so much now. No breeder would then have dreamt of mating animals which were closely connected by blood. The now familiar term "Sib" was scarcely known.

It is a debatable point, even at this remote date, whether the breed has improved to so great anextent as we are led to believe. Fashion is a curious thing, and can change very quickly. Alas! not always for the better. The "seventies" brought a somewhat remarkable change in connection with Clydesdales; the typical animal of that period was possessed of strong bones. It was immaterial whether they were round or flat, but it was absolutely essential that they should be possessed of plenty of roughness about the legs. The favorite cry was for "hair." Fortunately this fashion was short-lived. It was found that neither the quantity of hair, nor quality of bone were calculated to make good lasting animals. So the fashion of "fosey" legged ones soon became obsolete. Coming to the present-day type of Clydesdale, I am strongly convinced that the leaders of fashion—i. e., the principal exhibitors in the show ring—are not accomplishing the very object for which agricultural shows are intended—namely, the improvement of the breed and the education of the farmer at large with reference to same. A typical Clydesdale should be up to size, possessed of good quarters, neck, and head, plenty of substance, with clean, sharp, broad bones, good feet and pasterns, fit for all kinds of heavy work, and free from any constitutional weakness by close or sib breeding. Instead of this we have a sib-bred animal (possibly with a double dose of it) possessed of what is known as sweet kind of bones, flash legs, long pasterns, and, in the vernacular of the showyard, "quality all over." This is what agricultural shows are attempting to educate us up to. Am I a pupil? I say no, most emphatically. We want size, strength, an substance, and there can be both, without deducting from the quality. Quality does not necessarily mean fineness and want of substance. More than that, we must look at it from a utility point of view, which type is to be to the advantage of the greatest number of people. It will stand no argument.

One of my principle objections to the present position of the Clydesdale world is (and I put it plainly without much fear of contradiction from the vast majority of your readers) that we find that no sooner do the judges enter the ring than they select unblushingly the modern type, which I have already described. The animal must be "quality all over." On the other hand, we find a great, big, massive animal possessed of every good point which goes to make up (in my opinion) a thorough typical Clydesdale is passed over, for the simple reason that he or she is "too strong." That verdict is enough; and the animal is at once banished from the ring without competition. A still more objectionable state of matters exists, and one which I have often spoken of, and that is the unreasonable and illogical attitude taken by some judges, many of whom are dealers and exporters of the breed. We find that they have no sooner left the show ring than they are ready to purchase our stock, but the first objection they inevitably take is, that the animals want substance and size for their purpose. This is surely a contradiction with a vengeance to their actions in the showyard. What the breeder should aim at is to breed big, great, powerful draught horses, up to weight, possessed of good, strong, flat bones, with good feet and pasterns. These will pay him better in the end than breeding the "quality all over" kind.

In conclusion, I verily believe the fashion (which I have for years anticipated) is about to become an accomplished fact, and that in a very short time the slimly-got-up animal, however sweet, will have to take a back seat to the animal of nobler and mightier dimensions.—Galloway Tam in Scottish Farmer.

The Maritime Farmer
SUSSEX, N. B.

OUR Stallion Policies, covering against loss by **Death through Accident or Disease,** are more liberal and afford more protection to owners than any issued by Competing Company. They contain no vexatious clauses, having been drafted to cover **the special conditions** met with in this Country. They cover the horse no matter **where he might be** and not merely **in his own stable,** as certain Companies do. This is very important during the Breeding Season as the horse might die while being on the road. Do not **take any chances** by insuring with others, **insure with us;** The insurance premium represents only a small proportion of the service fees earned. Better risk the **loss of the premium** than the **purchase price** of your beast if it dies without insurance.

Better have and not need than need and not have.

STALLION INSURANCE

All kinds of live stock insurance transacted. *Write for particulars and address of nearest agent.*

POULTRY.

Facts About Hens and Eggs.

While heavy laying is as a rule desirable, phenominal egg records are not a guarantee of strong, rugged offspring. There must be a limit.

The hen that lays 150 eggs in a year is doing mighty good laying, and she is not so apt to break down early in life as is the one which is trying to "break the record."

Pullets and yearling hens that have done such remarkable work in their first season, are not so apt to do heavy work in the second year.

As a rule, hens that lay steadily during cold weather are indifferent hot weather layers.

Extreme cold and extreme hot weather affect hens alike.

The regular layers give the best sized eggs, while the spasmodic layer generally produces an assortment of sizes.

The size of the egg becomes smaller as the hen increases the number of her product. So also does the color towards the close of the litter.

The majority of eggs are laid between the hours of 9 o'clock in the morning and 3 o'clock in the afternoon.

There is not very strong fertility in the eggs laid by a hen that will produce from 30 to 50 eggs in succession.

Pullets that delay laying until February are not profitable birds to keep. Those that start in November or early December are the ones to be relied upon for winter laying. On a large egg farm near my home it is a rule that pullets that have failed to lay an egg by New Year's Day are killed and sent to market.

An egg laid in November or December will bring twice as much money as the one laid in March or April.

There is no such thing as an egg-laying type. There is but one true test of the layers, and that is by the aid of trap nests.

Hens forced for egg production by high feeding and stimulants, may give the desired number of eggs, but he future generations will show the ffect in weak conditions and constiutions. Pure food judiciously given s the only material the hardy, workng hen needs.

Provide the good, comfortable ouses, keep them clean and in a ood sanitary condition, and there will be no trouble about winter eggs, provided, of course, the fowls are kept strong and vigorous. They must have regular care and the food must e of the purest kind. Egg growing rests not solely with the hen,—much depends upon the man in charge.

In handling a goose, it should always be taken by the neck, and when lifted from the ground the body should be turned with the back towards the person handling it. In that position it cannot strike, and will remain quiet. Partly support body by seizing the first joint of the wing with one hand. If the goose is held facing one, it will strike hard blows with its wings or scratch with its feet.

It becomes quite a study to keep pullets laying reguffarly. System in feeding has much to do with it. When pullets begin to lay they seem quite uncertain. Some will lay regularly every other day, and some only twice a week. Moving layers from coop to coop simply upsets their habits, and they begin all over again and study the new situation, and during this time they usually stop laying.

According to a large number of analysis made of American eggs at the various agricultural stations, an egg on an average weighs two ounces, and has the following percentage of compositions; shell, 10.5; water, 6.6; fat, 9.3; and ash, 0.9. A side of beef contains on an average about the same percentage of protein but a larger percentage of fat. Eggs belong to the nitrogenous group of foods, and would naturally and quite properly be combined in the diet with material supplying carbohydrates (sugar and starch) such as cereals, potatoes, etc.

It is said that a plan for supplying the public with fresh eggs is being tried in Germany in the hope that it will increase the demand for a strictly fresh article. Egg depots are established in the principle cities at which the quality and freshness of the eggs are guaranteed. For every bad egg the purchaser is entitled to get fifteen good ones. Every poultryman has to mark all eggs which he sends to one of these depots, in such a way that they can be traced back to him, and if it is found that he furnished bad eggs as fresh ones, he will not be allowed to sell to the depot.

The hardest task in maintaining a constant and continuous egg yield is to keep the laying stock in prime condition, says Col. E. O. Roessle. This means such a condition of perfect health that the eggs will not only be laid regularly, but they will not be uniform in size, according to the breed laying them. Under such conditions we should have large eggs from Minorcas, White and Buff Leghorns, Plymouth Rocks and Brahmas. When such breeds lay small eggs, with perhaps double yolks, or soft-shelled eggs, the stock is out of condition and usually overfat. The eggs will thus be laid irregularly, and many times laying will stop entirely. Layers should be kept active, and activity is induced by short feeding. A hungry hen is usually a good layer.

It is hard to fatten a stunted chicken.

There is always a good market for good stock, so it pays to keep in the front ranks. The market is never overstocked with good goods.

For the city market there is nothing between the broiler and the roaster.

Fall chickens find a good market as roasters during January, February and March.

A FARMER'S GARDEN

IS without real serious meaning to many thousand farmers because they think it is too hard work or it is not convenient to work a horse. So many farmers fail to understand what truly wonderful possibilities there are in modern hand tools.

IRON AGE Wheel Hoes and Drills
(Now made in Canada)

do all of the sowing, hoeing, cultivating, weeding, furrowing, ridging, etc., in any garden with better results, far less work and some real pleasure for the operator. 38 or more combinations at $3.00 to $15.00. Ask your dealer about them and write us for new booklet, "Gardening with Modern Tools" also copy of our paper "Iron Age Farm and Garden News"—both are free.

1000 rolls No. 542 Farm Fencing, all No. 9 wire, spaced 6-12-12-12 ..... 15c per rod
100 kegs new wire nails, containing sizes, 2 in. 2 1-2 in. 3 in. & 4 in. $2.25 per keg of 100 lbs.

All delivered free to the cars here. Send order at once before stock is sold out. All orders filled promptly and only in order as received. Also bargains in Belting, Iron Piping, etc. Catalogue free.

IMPERIAL METAL CO., 3 Queen St. Montreal

If You Have Live Stock For Sale Advertise it in the Maritime Farmer.

Poultry Commission merchants say that one reason why a great many shippers are disappointed in the price they receive in good poultry is that they persist in shipping stock of sizes which are not in demand.

New York will take poultry either scalded or dry-picked. Boston wants what his customers will pay. When the market is well supplied the customers have a larger stock from which to select, and they always choose the best, leaving the second-class to be sold at hazardous prices.

The most important egg foods—mixed with exercise—are grit, bran, charcoal, cornmeal, pure water, clover or alfalfa hay, vegetables, green cut bone, cracked oyster shell, ground oats, scalded oats, sprouted oats, linseed meal, meat scrap or meat meal.

Study conditions. Don't feed too rich a mash. Feed according to appetites. Active fowls are always hungry. It is just as important how you feed as what you feed. Wholesome food is always a source of economy. A very important point in feeding poultry for market is to feed regularly.

Some poultrymen do not believe in cutting a fowl's wings by clipping off the quills, as it makes them look unsightly. Instead they spread out the wing and cut the feather portion from the quill. This leaves bare quills, and when the wing is closed it rarely shows that the wing has been tampered with. Only one wing is thus cut.

Frozen eggs are sold by weight, and are in demand in cities with the large bakers and cracker makers. In certain classes of restaurants frozen eggs are used for scrambled eggs and omelets.

The price is not fixed by the commission merchant. He can only obtain what his customers will pay. When the market is well supplied the customers have a larger stock from which to select, and they always choose the best, leaving the second-class stock to be sold at hazardous prices.

In testing eggs by lamplight the object is to discern the size of the air space in the eggs. When the egg is perfectly fresh, the space is very small and can just be seen at the broad end. Each day this space increases in size, and when it becomes very large the egg is ranked second-class. Cloudy eggs, or those which rattle, are suitable only for cheap cookery or manufacturing purposes.

A very successful egg farmer once said that in winter he always had something in his coops for his hens to pick at—scattered grain, a cabbage hanging up, and even bones with a little meat on them, always something to find in order that his flock should not contract lazy habits. In this he was humoring the natural instinct of the animal. A hen let run at large is almost always hunting, picking and scratching—first at a blade of grass then a bug, then a worm, and next a seed.

Experiments have proved that yarded hens are more prolific layers than those allowed free range. It costs more to keep them, but the returns in eggs are larger. Yarded hens are fed on food that will make eggs, and naturally this food is converted into the object for which it is intended. On the other hand, the same food fed to fowls that are on a range, is more apt to go to the making of flesh,—bone and muscle—rather than to making of eggs.

There is very little difference in weight of chicks of any of the breeds as compared with the others, for the first six weeks. This is so even in comparing the weight of Leghorn chicks with Brahma chicks. There is a gradual increase, however, after that time, although not so very much until after eight weeks of age. Naturally, from then on the heaviest breed chicks show the greatest gain.

125-Egg Incubator and Brooder Both For $13.75

If ordered together we send both machines for only $13.75 and we pay all freight and duty charges to any R. R. station in Canada. We have branch warehouses in Winnipeg, Man. and Toronto, Ont. Orders shipped from nearest warehouse to your R. R. station. Hot water, double walls, dead-air space between, double glass (12c) doors, copper tanks and boilers, self-regulating. Nursery under egg tray. Especially adapted to Canadian climate. Incubator and Brooder shipped complete with thermometers, lamps, egg testers—ready to use when you get them. Five year guarantee—30 days trial. Incubators finished in natural colors showing the high grade California Redwood lumber used—not painted to cover inferior material. If you will compare our machines with others, we feel sure of your order. Don't buy until you do this—you'll save money—it pays to investigate before you buy. Remember our price of $13.75 is for both Incubator and Brooder and covers freight and duty charges. Send for FREE catalog today, or send in your order and save time.

SEED OATS!

If the farmers of the Maritime Provinces, Quebec and Ontario want to make sure of getting the highest possible grade of seed oats for the Spring of 1913 apply to us at once. To prevent a repetition of the disaster that befell so many farmers last year by sowing devitalized grain, we have stored at Point Du Chene and Pictou 50,000 bushels of **large, selected, separated White Seed Oats, true to name and free from noxious weed seeds.** It will be the farmers own fault if they do not procure good seed as the extra yield of these oats pays twice over cost of the seed.

Our firm name is stencilled on every bag. Do not allow the dealers to give you other than Read's oats for seed.

JOSEPH READ & CO., LTD., Summerside, P. E. I.

$5,000,000.00 FOR PEERLESS WAY POULTRYMEN

Into the pockets of the users of The Peerless Way last year went five million dollars made from the poultry these people raised. Yet chickens are scarce in Canada and eggs are the scarcest of all food commodities. That is positively the fact.

To-day there are not enough Canadian CHICKENS or EGGS to go around. Thousands of chickens and hundreds of thousands of dozens of eggs are being shipped into Canada from the United States and other countries to help meet the demand.

Yet there is a shortage! Eggs are commanding a tremendous price—chickens are worth dollars.

Now is the time to take advantage of this situation and make money out of it yourself. You can raise and sell 600 chickens this next year, and you will find a quick and sure market for every one of them. You can get the top notch price for all the hundreds of dozens of eggs that your poultry lay.

Let us tell you how!

Poultry raising is the best business for any farmer, any farmer's wife or farmer's child. The poultry crop is the one crop that never fails. It pays better for the time and money invested; the profit is surest; it isn't overcrowded and never will be.

Our book "When Poultry Pays," will show you. Let us send it to you. It is interesting; it is instructive, and it contains the proof.

You need this book. It will be mailed free. A post card will bring it.

EGG BOXES
MILK BOTTLE CAPS
APPLE BARREL PULP HEADS

THE FARM HOME.

This Department is now being edited by a very competent lady who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

One Kind of Farmer.

He sells the whole of the apple crop
Whatever the price may be;
And he sells his milk to the last lone drop,
And there's none for the family.
When he kills a pig, he sells that, too,
And the same with the beef or lamb,
While the family fare the whole year through
Is bacon and spuds and ham.

He sells his eggs that his hens may lay,
And the chickens themselves as well
For he says, "There ain't no farm can pay
If you eat what you've got to sell;"
And he takes his children out of school
As soon as the law'll allow,
For he says the teacher's a "goldurn fool,"
And he's "needing the kids to plow."

His wife is weary and bent and sad
With the labor that she has done,
And his children have never known or had
Their rightful portion of fun,
But his cattle are fine and big and fat,
And his horses are sleek and trim,
Now, here is the question, plain and flat:
Are YOU in a class with him?
—Berton Braley, in Farm and Fireside.

David Copperfield.

By Charles Dickens.

(Continued from last issue)

Ham was quite in earnest as he. I dare say they would have said much more about her, if they had not been abashed by the unexpected coming in of Steerforth, who, seeing me in a corner speaking with two strangers, stopped in a song he was singing, and said: "I didn't know you were here, young Copperfield!" (for it was not the usual visiting room) and crossed by us on his way out.

I am not sure whether it was in the pride of having such a friend as Steerforth, or in the desire to explain to him how I came to have such a friend as Mr. Peggotty, that I called to him as he was going away. But I said, modestly—Good Heaven, how it all comes back to me this long time afterwards!—

"Don't go Steerforth, if you please. These are two Yarmouth boatmen—very kind, good people—who are relations of my nurse, and have come from Gravesend to see me."

"Aye, aye," said Steerforth, returning. "I am glad to see them. How are you both?"

There was an ease in his manner— a gay and light manner it was, but not swaggering—which I still believe to have borne a kind of enchantment with it. I still believe him, in virtue of this carriage, his animal spirits, his delightful voice, his handsome face and figure, and, for aught I know of some inborn power of attraction besides (which I think a few people possess), to have carried a spell with him to which it was a natural weakness to yield, and which not many persons could withstand. I could not but see how pleased they were with him, and how they seemed to open their hearts to him in a moment.

"You must let them know at home, if you please, Mr. Peggotty," I said, "when that letter is sent, that Mr. Steerforth is very kind to me, and that I don't koow what I should ever do here without him."

"Nonsense!" said Steerforth, laughing. "I mustn't tell them anything of sort."

"And if Mr. Steerforth ever comes into Norfolk or Suffolk, Mr. Peggotty," I said, "while I am there, you may depend upon it I shall bring him to Yarmouth, if he will let me, to see your house. You never saw such a good house, Steerforth. "It's made out of a boat."

"Made out of a boat, is it?" said Steerforth. "It's the right sort of a house for such a thorough-built boatman."

"So'tis, sir, so'tis, sir," said Ham, grinning. "You're right, young gen'l'm'n. Mas'r Davy, boy, gen'l'm'n's right. A thorough-built boatman! Hor, hor! That's what he is, too!"

Mr. Peggotty was no less pleased than his nephew, though his modesty forbade him to claim a personal compliment so vociferously.

"Well, sir," he said, bowing and chuckling, and tucking in the ends of his neckerchief at his breast: "I thankee, sir, I thankee! I do my endeavors in my line of life, sir."

"The best of men can do no more, Mr. Peggotty," said Steerforth. He had got his name already.

"I'll pound it it's wot you do yourself, sir," said Mr. Peggotty, shaking his head, "and wot you do well—right well! I thankee, sir. I'm obleeged to you, sir, for your welcoming manner of me. I'm rough, sir, but I'm ready—least ways, I hope I'm ready, you understand. My hous ain't much for to see, sir, but it's hearty at your service if ever you should come along with Mas'r Davy to seeit. I'm a regular Dodman, I am," said Mr. Peggotty, by which he meant snail, and this was in allusion to his being slow to go, for he had attempted to go after every sentence, and had somehow or other come back again; "but I wish you both well, and I wish you happy."

Ham echoes this sentiment, and we parted from them in the heartiest manner. I was almost tempted that evening to tell Steerforth about pretty little Em'ly, but I was too timid of mentioning her name, and too much afraid of his laughing at me. I remember that I thought a good deal and in an uneasy sort of way, about Mr. Peggotty having said that she was getting on to be a woman, but I decided that was nonsense.

We transported the shell-fish or the "relish" as Mr. Peggotty had modestly called it, up into our room unobserved, and made a great supper that evening. But Traddles couldn't get happily out of it. He was too unfortunate even to come through a supper like anybody else. He was taken ill in the night—quite prostrate he was—in consequence of Crab; and after being drugged with black draughts and blue pills, to an extent which Demple (whose father was a doctor) said was enough to undermine a horses constitution, received a caning and six chapters of Greek Testament for refusing to confess.

The rest of the half-year is a jumble in my recollection of the daily strife and struggle of our lives; of the waning summer and the changing season; of the frosty mornings when we were rung out of bed, and the cold, cold smell of the dark nights when we were rung into bed; of the evening schoolroom dimly lighted and indifferently warmed, and the morning schoolroom which was nothing but a great shivering-machine; of the alternation of boiled beef with roast beef, and boiled mutton with roast mutton; of clods of bread-and-butter, gog's-eared lesson-books, cracked slates, tear-blotted copy-books, canings, rulerings, hair-cuttings, rainy Sundays, suet puddings, and a dirty atmosphere of ink surrounding all.

I well remember though, how the distinct idea of the holidays, after seeming for an immense time to be a stationary speck, began to come towards us, and to grow and grow. How from counting months, we came to weeks, and then to days; and how I began to be afraid that I should not be sent for, and when I learned from Steerforth that I had been sent for and was certainly to go home, had dim forebodings that I might break my leg first. How the breaking up day changed its place fase, at last from the week after next to next week, this week, the day after to-morrow, to-morrow, to-day, to-night—when I was inside the Yarmouth mail, and going home.

I had many a broken sleep inside the Yarmouth mail, and many an incoherent dream of all these things. But when I awoke at intervals, the ground outside the window was not the playground of Salem House, and the sound in my ears was not the sound of Mr. Creakle giving it to Traddles, but was the sound of the coachman touching up the horses.

CHAPTER VIII.

My Holidays. Especially One Happy Afternoon.

When we arrived before day at the inn where the mail stopped, which was not the inn where mt friend the waiter lived, I was shown up to a nice little bedroom, with Dolphin painted on the door. Very cold I was, I know, notwithstanding the hot tea they had given me before a large fire down-stairs; and very glad I was to turn into the Dolphin's bed, pull the Dolphin's blankets round my head, and go to sleep.

Mr. Barkis the carrier was to call for me in the morning at nine o'clock. I got up at eight, a little giddy from the shortness of my night's rest, and was ready for him before the appointed time. He received me exactly as if not five minutes had elapsed since we were last together, and I had only been into the hotel to get change for sixpence, or something of that sort.

As soon as I and my box were in the cart, and the carrier was seated, the lazy horse walked away with us all at his accustomed pace.

"You look very well, Mr. Barkis," I said, thinking he would like to know it. Mr. Barkis rubbed his cheek with his cuff, and then looked at his cuff as if he expected to find some of the bloom on it; but made no other acknowledgement of the compliment.

"I gave your message, Mr. Barkis," I said: "I wrote to Peggotty."

"Ah!" said Mr. Barkis.

Mr. Barkis seemed gruff, and answered dryly.

asked, after a little hesitatian.

"Why, no," said Mr. Barkis.

"Not the message?"

"The message was right enough, perhaps," said Mr. Barkis; "but it came to an end there."

Not understanding what he meant, I repeated inquisitively: "Came to an end, Mr. Barkis?"

"Nothing came of it," he explained, looking at me sideways. "No answer."

"There was an answer expected, was there, Mr. Barkis?" said I, opening my eyes. For this was a new light to me.

"When a man says he wilkin,' said Mr. Barkis, turning his glance slowly on me again, "it's as much as to say that a man's a waitin' for an answer."

"Well, Mr. Barkis?"

"Well," said Mr. Barkis, carrying his eye back to his horse's ears; "that man's been a waitin' for an answer ever since."

"Have you told her so, Mr. Barkiss?"

"No—no," growled Mr. Barkis, reflecting about it. "I ain't got no

A Windsor Lady's Appeal

To all women' I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Uterine and Ovarian Tumors or growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write teday. Address Mrs. M. Summers, Box H. 309 Windsor, Ont.

WOMAN SICK FOR YEARS

Wants Other Women to Know How She was Finally Restored to Health.

Hammond, Ont. — "I am passing through the Change of Life and for two years had hot flushes very bad, headaches, soreness in the back of head, was constipated, and had weak, nervous feelings. The doctor who attended me for a number of years did not help me, but I have been entirely relieved of the above symptoms by Lydia E. Pinkham's Vegetable Compound, Blood Purifier and Liver Pills, and give you permission to publish my testimonial." — Mrs. LOUIS BEAUCAGE, Sr., Hammond, Ont., Canada.

New Brunswick, Canada. — "I can highly recommend Lydia E. Pinkham's VegetableCompound to any suffering woman. I have taken it for female weakness and painful menstruation and it cured me." — Mrs. DEVERE BARBOUR, Harvey Bank, New Brunswick, Canada.

Lydia E. Pinkham's Vegetable Compound, made from native roots and herbs, contains no narcotic or harmful drugs, and to-day holds the record of being the most successful remedy for female ills we know of, and thousands of voluntary testimonials on file in the Pinkham laboratory at Lynn, Mass., seem to prove this fact. Every suffering woman owes it to herself to give Lydia E. Pinkham's Vegetable Compound a trial

If you want special advice write to Lydia E. Pinkham Medicine Co. (confidential) Lynn, Mass. Your letter will be opened, read and answered by a woman and held in strict confidence.

call to go and tell her so. I never said six words to her myself. I ain't a goin' to tell her so."

"Would you like me to do it, Mr. Barkis?" said I, doubtfully.

"You might tell her, if you would," said Mr. Barkis, with another slow look at me, "that Barkis was a waitin' for an answer. Says you—what name it it?"

"Her name?"

"Ah!" said Mr. Barkis, with a nod of his head.

"Peggotty."

"Chrisen name? Or nat'ral name?" said Mr. Barkis.

"Oh, it's not her christian name. Her christian name is Clara."

"Is it though?" said Mr. Barkis.

He seemed to find an immense fund of reflection in this circumstance, and sat pondering and inеardly whistling for some time.

"Well!" he resumed at length. "Says you, "Peggotty! Barkis is a waitin' for an answer." Says she, perhaps, 'Answer to what?' Says you, 'To what I told you.' 'What is that? says she. 'Barkeis is willinj,' says you."

This extremely artful suggestion, Mr. Barkis accompanied with a nudge of his elbow that gave me quite a stitch in my side. After that, he slouched over his horse in his usual manner; and made no other reference to the subject except, half an hour afterwards, taking a piece of chalk from his pocket, and writing up, inside the tilt of the cart, "Clara Peggotty"—apparently as a private memorandum.

Ah, what a strange feeling it was to be going home when it was not home, and to find that every object I looked at reminded me of the happy old home, which was like a dream I could never dream again! The days when my mother and I and Peggotty were all in all to one another, and there was no one to come between us, rose up before me so sorrowfully on the road, that I was not sure that I was glad to be there—not sure but that I would rather have remained away, and forgotten it in Steerforth's company. But there I was; and soon I was at our house, where the bare old elms wrung their many hands in the bleak wintry air, and shreds of the old rooks' nest drifted away upon the wind.

The carrier put down my box at the garden gate, and left me. I walked along the path towards the house, glancing at the windows, and fearing at every step to see Mr. Murdstone or Miss Murdstone lowering out of them. No face appeared, however; and being come to the house, and knowing how to open the door, before dark, without knocking, I went in with a quiet, timid step.

God knows how infantine the memory may have been, that was awakened within me by the sound of my mother's voice in the old parlor, when I set foot in the hall. She was singing in a low tone. I think I must have lain in her arms, and heard her singing to me when I was a baby. The strain was a new one to me, and yet it was so old that it filled my heart brimful; like a friend come back from a long absence.

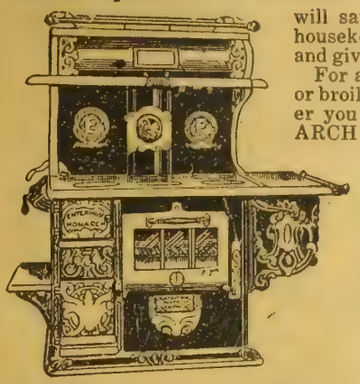
I believed, from the solitary and and thoughtful way in which my mother murmured hersong, that she was alone. And I went softly into the room. She was sitting by the fire, suckling an infant, whose tiny hand she held aginst her cheek. Her eyes were looking down into its face and she sat singing to it. I was so far right, that she had no other companion.

I spoke to her, and she started, and cried out. But seeing me, she called me her dear Davy, her own boy! and coming half across the room to meet me, knelt down upon the ground and kissed me, and laid my head down on her bosom near the little creature

A Castle in Spain

is "not in it" with a good, substantial, up-to-date steel range in your kitchen. Don't hoard up all your money, building castles for future years, and in the meantime have your wife worn out in daily toil, working with a poor stove. The Farmer's wife, as well as the Farmer, needs good tools. A few dollars invested now in an—

Enterprise Monarch Steel Range



will save the time and temper of the housekeeper, lessen fuel and repair bills and give satisfaction through years of use

For a quick, responsive fire for baking or broiling, and lots of hot water (whether you burn wood or coal) the MONARCH is what you should have.

WE CLAIM it is as good as any range on the market—and better than most. Not the cheapest, nor the dearest, but

A Guaranteed High Class Range at Moderate Cost.

that will pay for itself in a short time; with all the good features of all other ranges and some entirely its own.

Let us send you a circular describing it, if your dealer does not handle the MONARCH.

You judge a man not by what he promises to do, but by what he has done. That is the only true test. Chamberlain's Cough Remedy judged by this standard has no superior. People everywhere speak of it in the highest terms of praise. For sale by all dealers.

that was nestling there, and put its hand up to my lips.

I wish I had died. I wish I had died then, with that feeling in my heart! I should have been more fit for heaven than I ever have been since.

"He is your brother," said my mother, fondling me. "Davy, my pretty boy! My poor child!" Then she kissed me more and more, and clasped me round the neck. This she was doing when Peggotty came running in and bounced down on the ground beside us, and went mad about us both for a quarter of an hour.

It seemed that I had not been expected so soon, the carrier being much before his usual time. It seemed, too, that Mr. and Miss Murdstone had gone out upon a visit in the neighborhood, and would not return before night. I had never hoped for this. I never thought it possible that we three could be together undisturbed, once more; and I felt, for the time, as if the old days were come back.

We dined together by the fireside Peggotty was in attendace to wait upon us, but my mother wouldn't let her do it, and made her dine with us. I had my own old plate, with a brown view of a man-of-war in full sail upon it, which Peggotty had hoarded somewhere all the time I had been away, and would not have had broken, she said, for a hundred pounds. I had my own old mug with David on it, and my own little knife and fork that wouldn't cut.

While we were at table, I thought it a favorable occasion to tell Peggotty about Mr. Barkis, who, before I had finished what I had to tell her, began to laugh, and throw her apron over her face.

"Peggotty," said my mother. "What's the matter?"

Peggotty only laughed the more, and held her apron tight over her face when my mother tried to pull it away, and sat as if her headwere in a bag.

"What are you doing, you stupid creature?" said my mother, laughing.

"Oh, drat the man!" cried Peggotty. "He wants to marry me."

"It would be a very good match for you; wouldn't it?" said my mother.

"Oh, I don't know," said Peggotty. "Don't ask me. I wouldn't have him if he was made of gold. Nor I would not have anybody."

"Then, why don't you tell him so, you ridiculous thing?" said my mother.

"Tell him so," retorted Peggotty, looking out of her apron. "He has never said a word to me about it. He knows better. If he was to make so bold as to say a word tome, I should slap his face."

Herown was as red as ever I saw it, or any other face, I think;but she only covered it again; for a few moments at a time, when she was taken with a violent fit of laughter; and after two or three of those attacks, went on with her dinner.

I remarked that my mother, though she smiled when Peggotty looked at her, became more serious and thoughtful. I had seen at first that she was changed. Her face was very pretty still, but it looked careworn, and too delicate; gnd her hand was so thin and white that it seemed to me to be almost transparent. But the change to which I now refer was superadded to this: it was in her manner, which became anxious and fluttered. At last she said, putting out her hand, and laying it affectionately on the hand of her old servant:

Editor's Note.—Owing to the fact that our next issue will be our Special Spring number for which we have a special story, the next instalment of the story, David Copperfield, will not appear until our issue of April 29th.

N.B.—Coffee users will find Red Rose Coffee as generously good as Red Rose Tea. 370

Women and Higher Education.

"The claim has been made," says Margaret Anglin in the American "World," "that higher education for women chills the heart in livening the intellect, that the development of the intellect along the pathways of culture and higher thinking makes women cold and cynical in regard to human emotions.

"We are told that the super-educated college woman is incapable of being swayed by the same deep feelings as the child of nature who knows not the meaning of psychology, and to whom ethics and the subtleties of philosophy are reduced to the primitive conception of right and wrong. I doubt this very much. The woman of high education or the professional woman feels the same forces swaying her, but she knows how to control them. What higher education and the professional life do for women, however, is to eradicate the ostentatious display of feeling so long regarded as necessary for the "womanly woman."

"The power to repress the emotion has no effect on the ability to experience them. Convention and good breeding necessitate self-restraint, but

An Encouraging Message

I have a message of hope and good cheer, of encouragement and inspiration to every suffering woman. I have endured the torture due to female troubles and the consequent despondency, and mental agony almost to the point of despair, and I have been restored from this condition to a state of vigorous health, and to the happy, exhilarating frame of mind which accompanies physical well being. This change has been brought about wholly by the use of ORANGE LILY.

In addition I have had the privilege and pleasure of inducing multitudes of other suffering women to give ORANGE LILY a trial, and have received thousands of enthusiastic acknowledgments of the blessings it has brought to them. The following is a sample:

Truro, N. S., April 5, 1909.

Dear Mrs. Currah,—Your very kind letter was received yesterday. In reply to your question about my health, I am thankful to say that I am very well. As I have never given you a statement of my case you may be interested in it

For several years I have suffered untold agony. This suffering was continuous, but I would have violent attacks every few weeks, each attack lasting several days. The first Sunday in November, I felt the pain increasing and so did not go to prayers. The rest of the family did go, and soon after the forcing down pains seized me and I had to remain on the floor until their return. I was in great pain all night and was very sick for a whole week.

Then Mrs. L. came to see me and told me of your wonderful medicine. I got my husband to send for it right away, as I was too sick to write myself. (My doctor could do nothing for me.) I have used 5 boxes of ORANGE LILY, have had three months of good rest, and am now well, never better in my life. I have not had the old pains since. I often ask my husband if it is myself that is going around and doing my own work. I can scarcely believe it. It brings tears of joy to my eyes. I could shout it to all the world. I cannot speak enough in its praise.

Your friend, MRS. E. H. F.

Receiving, as I do, dozens of such reports each day, I feel impelled to make known to my suffering sisters the merits of ORANGE LILY. It differs from other so-called remedies in that it is not taken internally. It is a strictly local treatment, and is applied directly to the affected organs. Its curative elements are absorbed into the congested tissues, expelling the stagnant foreign matter which has been irritating the membrane and oppressing the nerves, and a growing feeling of physical and mental relief is noticeable almost from the start. It is a positive, scientific remedy, and even if you use no more than the Free Trial treatment you will be very materially benefited.

FREE TRIAL OFFER

I want every reader of this, who suffers in any way from painful monthly periods, irregularities, leucorrhoea, inflammation or congestion of the womb, pains in the back, etc., to send me their addresses, and I will forward at once, without charge, 10 days' treatment. If your case is not far advanced it may entirely cure you, and in any event it will do you much good. I am so earnest in making this statement, and so positive that it is true, that I trust every sufferer who reads this notice will take advantage of my offer and get cured at home, without a doctor's bill. Address, enclosing 3 stamps, MRS. FRANCES E. CURRAH, Windsor, Ont.

Had Pains in Her Liver

Doctors Only Relieved Her For A Time.

When the liver is inactive everything seems to go wrong, and a lazy, slow or torpid liver is a terrible affliction, as its influence permeates the whole system and causes Biliousness, Heartburn, Sick Headache, Floating Specks before the Eyes, Jaundice, Brown Blotches, Constipation, Catarrh of the Stomach, etc.

Milburn's Laxa-Liver Pills stimulate the sluggish liver, clean away all waste and poisonous matter from the system, and prevent as well as cure all sickness arising from a disordered condition of the liver.

Mrs. Wesley Estabrooks, Midgic Station, N.B., writes:—"For several years I have been troubled with pains in the liver. I have had medicine from several doctors, but was only relieved for a time by them. I then tried Milburn's Laxa-Liver Pills, and I have had no trouble with my liver since. I can honestly recommend them to every person who has liver trouble."

Price, 25 cents per vial or 5 vials for $1.00. For sale at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

P. E. Island Seed Oats For Sale

In order that our local farmers should be supplied with the very best cleaned and true to name oats, we have purchased from the most reliable growers in Prince Edward Island, a large quantity and will therefore be in a position to sell to any who may want good, reliable seed.

the woman who can control her feelings and whose breeding and education have taught her that unnecessary display of feeling is vulgar, experiences them just the same. It is this poise of the woman of culture and intellect, of business ability and professional standing, which gives rise to the complaint that she is not capable of human sympathy and emotion.

"Higher education, culture, and the broader life that has been opened to women in the last quarter century has done more toward the development of real human sympathy and feeling than all the artificiality and affection of the years before.

"When I speak of higher education I do not necessarily mean the accumulation of a lot of college degrees in dead languages or mathematics. Even in the lives of these self-restricted creatures the feelings which they have forced to lie dormant are liable to burst forth with the so-called sincerity of the untutored child of nature.

"By the woman of higher education and culture I mean one whose intellect has broadened her life by training, and whose mind has been able to comprehend and digest the facts which education has placed before her. A woman with keen sensibilities and a well-trained mind, a woman of strong intellectuality, despises the gushing display of feeling. If the charges of cold are brought against her it should be with a word of thankfulness. Lack of feeling is so often hidden by the disguise of hysterical protestation and gushing emotionalism, that women of culture and refinement shudder at the thought of being placed in the same category.

"With women who are incapable of feeling the easiest thing in the world is to assume setiment and emotion. Naturally, as in the case of all artificiality, it is apt to be overdone. There is no reason why the holiest of emotions should not be rational, nor is there any reason why woman's power of feeling should be placed upon the basis of absence of higher education."

Entertaining Guests.

There is one important thing that should not be overlooked in the entertainment of guests; treat them with equal courtesy. Be also careful to treat your poorer and humbler relatives, whom you have invited to your house, with due respect and cordiality—neither with any show of patronage, nor any marks of neglect. Whoever else may be your guests, let there be nothing in your manner to indicate that you are ashamed of the good old aunt that is visiting you, and the truest way to accomplish this is not to be ashamed of her. She may not dress in the latest fashion, and her talk may be of country matters; she may ask some queer questions, and show her familiarity with a style of life that is somewhat foreign to that of your other visitors; but if you are not willing, under all circumstances, to treat her with cordial civility, you should not have asked her to your house. No man ever loses caste, in the opinion of the truly refined and cultivated, by showing courtesy towards such as move in a lowlier sphere. Neither should the rich visitors be treated with overobsequious attention. They will not thank you for it, or respect you any the more for your excess of deference. Above all, never allude to the fact of their visiting you as an act of condescension on their part, or, by any word or look indicate that, in your opinion, they hold a higher position in society than you do. If you fall in with all their prejudices, and echo all their sentiments, and hang upon their lips, as the bees cling to 'every opening flower,' they will probaly see

IT must satisfy you.

If it doesn't, your dealer, backed by us, gladly returns your money.

Isn't that a sincere way to invite you to try it?

REGAL FLOUR

Maple Syrup Makers Enter This Contest

$500 IN GOLD CASH PRIZES

WHY not be a WINNER in this contest? We are giving away $500 in Gold Cash Prizes to users of the Grimm "Champion" Evaporator.

Cut Out This Coupon

Full particulars will be mailed on receipt of above coupon.

The competition will take place during the last two weeks of April and the samples of syrup and sugar received will be placed on exhibit in the show windows of the "Montreal Star." Every purchaser and user of the Grimm "Champion" Evaporator may take part in this contest. *Now is the time to properly equip yourself* to make high grade syrup and sugar—high priced and therefore profitable. Do it now before the sap runs. State the number of trees you will tap and we will give you prices on a suitably sized outfit. Address all enquiries:

through it all, and place you accordingly. Last of all, whoever may be your visitors, keep the skeletons out of sight. Family woes and trials and misfortunes, if they are made the staple of conversation, will cause the visit of your guest to be disagreeable. If you have invited him for the sake of his aid and sympathy, and he understands it to be so, it is another matter. In this case he comes for your comfort, and not for his own pleasure. But if he visits you out of pure friedship, and expecting to have a good time, lock up your closets where you keep your skeletons. The deepest sympathy will not endure constant draughts upon its water with out running dry.

Keep the Refrigerator Clean and Sweet

Watch your refrigerator closely this summer. It's better to have no refrigerator at all than to have one not perfectly clean and sweet.

In the first place, keep the shelves of the food chamber in good order. Wipe up any spilled liquids at once, and keep all crumbs brushed away. Do not allow odds and ends of food to accumulate in the refrigerator. If they are not used at a reasonable time, throw them away before they begin to spoil and taint the other food.

Milk absorbs odors very readily, as do most cooked foods also, though in a less degree. It is best, then, to cover closely such articles as fish, cooked cabbage, and the like, when they must be put into the ice box.

CLEAN EVERY WEEK.

Once a week the refrigerator should have a thorough cleaning. Remove all food from the food chamber, cover, and set in a cool place. Then remove the racks and wash them well with hot soap suds. Rinse with hot soda water, then with clear hot water. Wipe dry, and set in the sun to air. Borax or ammonia may be used instead of soda.

Wash the interior of the food chamber thoroughly in the same manner, using a small scrub brush. Use a sharp wooden skewer to clean the grooves and ledges that cannot be reached with the brush.

AS TO THE DRAIN.

The ice chamber next demands attention. Remove the ice, wrapping it in a piece of old flannel or newspaper to prevent melting. Then wash out the ice chamber with hot suds, and rinse first with hot soda water, then with clear hot water. The drain pipe should be cleaned with a flexile wire to which a bit of cloth is attached. Then pour down it hot soda water, and afterwards boiling water. See that every part of the refrigerator is wiped dry, and leave it open an hour or more to air.

If the refrigerator drains into the house drain, the traps must be carefully cleaned and kept in good working order. If a drain pan is used, it should be washed in the same way as the other parts of the refrigerator.

If this cleaning is done regularly every week, it will not take long or be very hard, and you will never notice that "ice-box taste" about any of your food.—Kansas Industrialist.

Children are much more likely to contract the contagious diseases when they have colds. Whooping cough, diptheria, scarlet fever and consumption are diseases that are often contracted when the child has a cold. That is why all medical authorities say beware of colds. For the quick cure of colds you will find nothing better than Chamberlain's Remedy. It can always be depended upon and is pleasant and safe to take. For sale by all dealers.

IHC Wagons Are As Good As They Look

TO really know the value of a wagon you must know of what material it is made, how it is built and about how many years of satisfactory wagon service you may expect. When you know all there is to know about I H C wagons it is safe to say that your next wagon will bear the I H C trademark—the stamp of quality and honest value.

Every piece of wood used in I H C wagons is carefully selected and air-dried. Only in air-dried lumber does wood retain its full strength and elasticity. All steel or iron is selected with the same care to secure the greatest possible strength. Thorough knowledge of the strain each part must stand is necessary because a wagon, like a chain, is no stronger than its weakest part. Every part of I H C wagons

Petrolia Chatham

has the same relative strength. The men who build I H C wagons know why one part is built stronger than another, know the exact strain it will have to bear. This same thorough knowledge has enabled them to build a wagon of light draft, which puts the least strain on the horses, without impairing the strength or durability of the wagon.

The finishing touch, the thing that adds to the life and appearance of an I H C wagon, is pure paint. Cheap paint may improve the appearance of a wagon for a short time, but after that is a positive detriment. Only pure paint is used on I H C wagons. It fills the pores of the wood, prevents shrinking, swelling, warping and twisting, and acts as a wood preservative.

There are many other reasons why I H C wagons are such good wagons, why owners say they are the best and most satisfactory. Have the I H C local agent show you an I H C wagon, or, if you prefer, write the nearest branch house for catalogues.

Put Any Weight on a Maritime Fence

and it stands the test. Man or beast can't break it down. Maritime Fence never sags or gets out of shape. Made from extra heavy imported hard drawn steel wire, thicker, stronger and galvanized so it is peel-proof. It is the last word in strength and durability.

The staying quality of Maritime fence is in the simple lock with the bull dog grip. It never lets go—never lets the fence get crooked. Maritime Fence is always sightly; always straight—always best. The quality of material and construction makes it best.

Don't buy fence until we have put our catalog and price list into your hands, postpaid, by mail. Costs you nothing to find out all you want to know about wire fence. Get your pen now and write on a postal "Send the catalog." 9

MARITIME WIRE FENCE

New Brunswick Wire Fence Co., Limited
Moncton New Brunswick

The Art of Breadmaking.

At the recent Women's Congress held at Lansing Mrs. C. W. Foulk, of the University of Ohio, gave a practical talk on bread and breadmaking, a report of which follows:

"There are two kinds of flours classified from the standpoint of the person who bakes; they are pastry flour and bread flour. If one is not in a position to have both kinds it is best to secure the bread flour, for the other kind can be made from the bread flour by the addition of a little corn starch and sugar. No attempt should be made to build a good loaf of bread out of flour for pastry baking.

"Again, flour may be classified into white flour, graham flour and whole wheat flour. The two latter are very good to use, but they have in some regards been overestimated as to nutritive value. For a well person who has a good digestive system that can care for the coarser indigestible fibre present in the unbolted kinds of flour they are all right and give a maximum of food value from the wheat used in the manufacture of the product; but for a person with a weak stomach it has been satisfactorily demonstrated in the laboratory that more of the white flour bread is digestible and that it creates less irritation to the stomach and other digestive organs. White bread flour is especially fitted for dyspeptics, although the contrary has been the general belief of laymen.

Yeast.—She proceeded next to explain that the yeast used in the manufacture of bread is a plant that grows when the condition of temperature, food and moisture for its development are provided. The quality of the bread largely depends upon the yeast and its growth. There are three classes of yeast used by housewives in the making of bread. They are liquid yeasts, dry yeast and compressed yeasts. A goodly number of women use the liquid yeasts. They are made with starter. To get good yeast two weeks is the longest one should keep them when expecting to have every batch of bread good. Dry yeasts are generally to be recommended above the liquid type; but the speaker was most favorable to the compressed kind. These are less likely to be contaminated, being wrapped in tinfoil. Care should be exercised that they should be fresh and sweet. Yeasts thrive best on sugar, and for this reason the speaker advised the addition of salt last in the mixing of bread instead of earlier, as it arrested in part the action of the yeast plant.

Mixing.—Two methods of making bread exist among our farmer women. They are known as the short and long methods. By the shorter method the bread is set in the morning and finished the same day. The long method requires that the bread be set in the evening and finished the following day. The long method requires less yeast. The speaker did not approve of this method. Many women who follow it get up in the middle of the night to mix the dough. This wholly unnecessary and should be abandoned for the shorter way. As indicated above, the short way of making bread demands the use of a larger amount of yeast. To learn how much yeast could be added without producing a noticeable flavor in the bread, experiments were tried in the cooking department of the University of Ohio, where it was found that seven yeast cakes to one loaf of bread did not impair the quality of the resulting loaf. Hence one should not fear to get too much of the yeast mixed with the flour. Mrs. Foulk stated that they would be able to finish their bread by following the short method in from three to four hours.

A comfortable living room is suited to the raising of bread. The temperature, however, should be even and no cold drafts be allowed to strike the container of the dough. Often sour bread results from keeping the bread in a too warm room.

Bread should not be kneaded too long. Long kneading makes a white loaf, but it is not the best flavored. Then, too, the finest loaves are those baked in small tins. It has been observed by the speaker that not a single contestant who baked bread in large double tins won in contests over those who used the small tins. The loaves baked in the small single tins are sure to be baked better, and other things being equal, are certain to be favored over those made in the larger tins.

The bread should be allowed to rise until it is double the original bulk and then worked down again. If it is permitted to rise more than this the second rising is apt to be slow and consequently give inferior results. By mixing when double the first bulk one gets a desirable action from the yeast again. She advised but the two mixings.

Baking.—The oven should be at such a heat when the bread is put in that a piece of unglazed paper will be browned in four minutes. Place the bread and then increase the heat during the next ten minutes, when the bread will stop rising. In the second ten minutes the loaves should become a rich golden brown. After this the heat should be gradually diminished. Leave the bread in from 40 to 60 minutes. It is better to have it overdone than not quite done. Loaves without a rich brown crust should be avoided, they are not fit for eating. If one does not like the crust, cut it off. This point was emphasized by the speaker, who stated that much ill-health results from the poorly baked bread that is eaten in this country.

After baking, the bread should be taken from the oven and pan, laid upon a clean white cloth, but not covered, and allowed to remain until cooled.

The question of the use of bread mixers was raised and the speaker stated that they were all right for the beginner, but the older women who had learned to make bread by hand-mixing found that they could not determine so well when the bread was mixed to the proper consistency. These women seem to know by feeling when to stop mixing.

The address was closed with a suggestive recipe for the making of good bread. The following ingredients were given:

One cake of compressed yeast; one pint water and one pint of milk heated to scalding point and cooled; two tablespoonfuls of sugar; two tablespoonfuls of lard or butter, melted; three quarts of sifted flour; one tablespoonful of salt.

Dissolve the yeast and the sugar in the liquid (water and milk), add the lard or butter (shortenings), and one-half of the amount of flour. Next beat with a spoon until smooth. This is for the purpose of working air into the dough for the yeast to feed upon. Add balance of flour or enough to make a dough that can be handled. Add the salt last for the reason mentioned above. Knead until smooth and elastic. Place in a greased bowl, cover and set aside where the temperature will be suitable and allow to stand until it doubles in bulk. Then mould into loaves. Place in well-greased bread pans of small size, filling half full. Bake from 40 to 60 minutes. You may use two cakes of the yeast instead of the one. This bread can be made in three hours. Where dry yeast is used make in the same manner except that the yeast must be first dissolved.—Mrs. C. W. Foulk.

Your Crops don't eat enough meat

Perhaps you think this is rather a strange saying.

Not at all. Your crops eat, just as you do. Just as in your case you grow healthy and strong with good and proper food, and thin and weak with poor food, so they---your crops---with proper food will grow healthy, abundant and strong, and bring you big returns.

The food your crops feed on consists of Nitrogen, Phoshoric Acid and Potash, and that food which they depend upon for size and quality of their fruit is POTASH, which we have aptly termed the "meat" that your crops eat.

"POTASH PAYS"

And we can prove that POTASH pays. Hundreds of farmers in Canada have doubled their crops with the proper use of POTASH, and this is the way they have done it.

They have taken the ordinary fertilizer which they buy from their dealers and which contains less than 10 p. c. POTASH and they have added enough POTASH, under very easily followed instructions, to make that fertilizer a 10% fertilizer.

The results have brought many a penny to their pockets. **YOU** can do the same. Your crop, no matter whether it is oats, wheat, apples, potatoes, tobacco, corn or anything else, removes from your soil **three times** as much POTASH as it does Phosphoric Acid. But the ordinary low-grade fertilizer contains only 2% POTASH as against 8% Phosporic Acid.

So, Mr. Farmer, this does not give back to your soil the proper amount of POTASH. Naturally you must increase this amount of POTASH in order to make a proper fertilizer. You don't have to take our word for this. Ask any Agricultural expert in any part of the world and he will tell you that it is true.

So, then, if you want to raise a bumper crop--if you want to get the maximum amount of produce from your soil, use a 10% POTASH fertilizer. Insist upon it. If your dealer does not sell POTASH we will gladly ship you the POTASH which we have stored ready for immediate delivery in warehouses at Montreal, St. John, N. B., and Toronto. You can mix your own fertilizer at home if you want to, and our experts will tell you how to do this free.

Send for free booklet which will tell you how to properly fertilize the kind of crop **YOU** raise. We will gladly send you this important and interesting booklet free.

Send your order for POTASH through your dealer or if your dealer has not got it, send us the dealer's name and we will quote you prices and send full particulars.

"Potash Pays." Make this year's crop a bumper crop. Ask us to help you---write for free expert advice TO-DAY.

GERMAN KALI WORKS, Inc

TEMPLE BLDG., TORONTO

HAD BOILS
ON FACE AND BODY
WAS TROUBLED FOR 8 YEARS.

Boils in themselves are not a dangerous trouble, but still, at the same time are very painful.

They are caused entirely by bad blood, and to get rid of them it is absolutely necessary to put the blood into good condition.

For this purpose there is nothing to equal that old and well known blood medicine, Burdock Blood Bitters.

Mrs. James Mageean, Floral, Sask., writes:—"I was troubled for eight years with boils on my face and body, and I tried everything I could think of. My neighbors told me to drink water off of sour corn meal, but I kept getting worse until one day a woman in town asked me why I didn't try Burdock Blood Bitters. My husband got me two bottles, and before one was gone my boils had all disappeared, and I feel like a different woman. I can't tell you how thankful I am for your medicine. I will recommend it to all suffering women."

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

MAXWELL'S HIGH SPEED CHAMPION

The Wringer Board extends from the side, out of the way of the cover. This allows practically the whole top of the tub to open up—makes it easy to put in and take out clothes.

No other washer has as large an opening. No other washer can be worked with crank handle at side as well as top lever.

Do you use Maxwell's "Favorite"—the churn that makes quality butter?

Write us for catalogues if your dealer does not handle them. 89

FLORICULTURE.

Mrs. S. A. J., St. John, writes:—Is it possible to grow Geraniums and Fuchsias in the same window? I am informed that Fuchsias will not grow in the same window as Geraniums because the odor of the latter will kill them. Which is the best season to repot plants generally—spring or fall? Where can I get seeds of the Wander Berry? Is it a pretty plant for the garden?

This old superstition of the incompatability of temper as between Geraniums and Fuchsias is furnished on facts to the following extent only: The former requires plenty of sunshine and the latter partial shade, such as a north window. The color has nothing to do with it. Spring is the best time for repotting generally Fall repotting is, of course, also necessary with most plants. You can get seeds of the Wanderberry, so called, from J. L. Childs of Floral Park N. J., its disseminator, and from some other catalogue seedsmen. From observation of its culture this past season under the climate conditions of New Brunswick, it could not, by any stretch of imagination be considered as a very ornamental plant from the florist's standpoint.

Ferns, St. John, sends four leaves of ferns for identification. These are as numbered: One, Pteris Senalota; two, Polystichum Vulgare; three, Pteris Adiantoids; four, Pteris Wimsetti—all good ferns for fern dishes. The Polystichum should not be too prominent in mixed dishes as they require and will make a period of rest.

Tree Lover, Hampton, writes:—Please tell me the botanical name of the Norfolk pine? Is it a satisfactory house plant as compared with a palm?

Anracaria Exceisa is the required name. This plant is a most satisfactory house plant and its treatment is practically identical with that of palm. The spring like weather of the past few days is causing all house plants to freshen up and start new growth. Where possible repot all pot bound plants of soft texture. Ferns and Rubber plants, of course, excepted unless you are sure that they need repotting.

Do not the spring catalogues make one think of that little place in the country or our little city plot. I think very few vines or shrubs would conceal an unsightly fence or building. It is wonderful what results can be obtained.

Persons owning summer camps should plant a few shrubs or tall flowering plants near a verandah to "tie the house to the ground" as the landscaper expresses it. Much quicker results can be obtained by this method than with permanent vines.

Important Publication.

The Department of Agriculture of the Dominion of Canada has just published a neat book, composed of the reports of Mr. W. H. Bunting, the expert that the Department sent over the Dominion to inquire into the fruit raising conditions of the various provinces. Referring to Novg Scotia Mr. Bunting says:

MORE THOROUGH SPRAYING NECESSARY. 1912.

"However, partly on account of the immense size of the trees, and partly on account of lack of suitable appliances, spraying has not been carried on with the energy and thoroughness necessary to produce the best results. Careful and thorough spraying, followed up by a systematic thinning of the fruit in seasons like the one just passed, will work wonders in equalizing and regulating the crop and enabling Nova Scotia fruit to be on the market every year with a first class article."

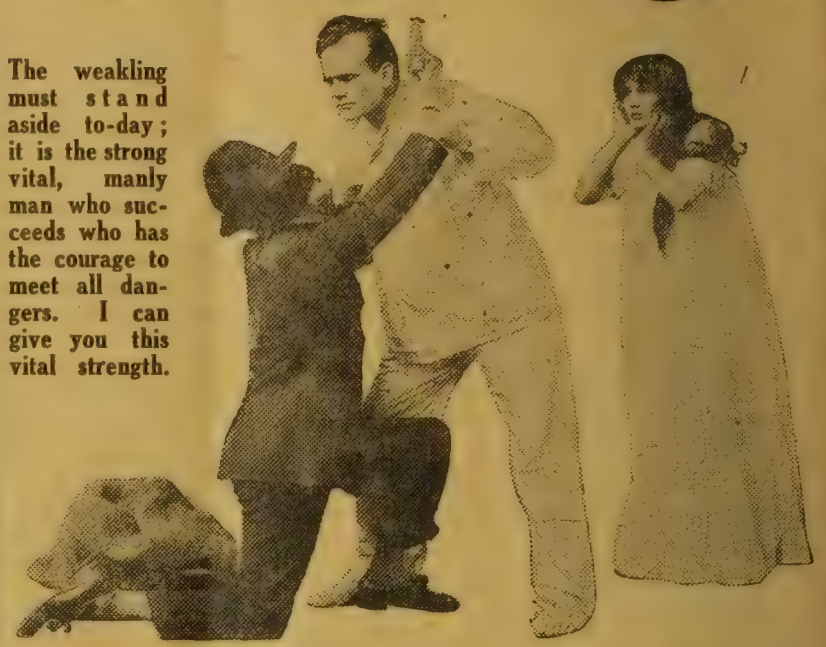
In a summary on the whole province upon spraying he further says:

SPRAYING.

"It is only a few years since spraying has come to be considered one of the essentials of successful orcharding. A solution of lime and sulphur, combined with a certain proportion of arsenate of lead has become the panacea of the fruit grower for nearly all troubles which threaten his orchard, be they insect or fungus. "Spraying without ceasing" has become the watchword, and woe betide him who, when the time comes to dispose of his crop, has neglected this part of the care of his orchard. The inspector will be after him, the buyer will neglect him, and the general public will roundly censure him because his product will not by any means have the quality which careful, thorough spraying would have insured."

Restores Men To Vital Vigor

The weakling must stand aside to-day; it is the strong vital, manly man who succeeds who has the courage to meet all dangers. I can give you this vital strength.



Vitality is the thing which makes success; it gives men that compelling power which sends them forth eager and equipped to meet and overcome all obstacles; it is the thing which gives our young men courage to face death; it is the thing which inspires and holds a woman's love and faith. No matter what your age, I can give you this same vitality. I can restore the vigor you lost, no matter what early or later indiscretion may have sapped your streagth. I can make you "young" and keep you "young." From an intimate and studious observation of possibly 100,000 weakened men I say to you that vitality or the lack of it means all the difference between a manly man and a half man. The man who bubbles with vital power will exert a pleasing influence upon all with whom he comes in contact; women are naturally attracted to him, as are men. Lack of vitality is a negative condition, and it even repels. You wear my Health Belt and suspensory attachment all night; it sends a great, glowing, health-giving current of electro-vimut into your nerves, blood and organs; it takes all the "kink" out of your back and all the coward out of your makeup; it puts you right up in the "feeling fine" class and keeps you there. No stimulation, no false results; just a sure return to manhood and courage. Recommended also for rheumatism, pain in the back, kidney, liver, stomach and bladder disorders. It makes you feel young and keeps you feeling young forever.

Let Me Send You THIS BOOK Free

Here is my latest illustrated book, "Health In Nature, containing a fund of privrte information relating to weaknesses of men. All men, young or old, can read every word of this little publication with great profit Sent to you in plain, sealed envelope by mail. The book is not written with the idea of compelling you to use my Health Belt; it is meant merely as a guide for men, and while my Belt is fully described, there is absolutely uo obligation on your part to purchase. I simply want you to read this book that you may know certain truths about all weaknesses, which have never been printed before. Vitality is the greatest thing in the world, and I can supply you with it. Please fill in the coupon for the free book.

DR. M. F. SANDEN, CO., 140 Yonge St., TORONTO, ONT.

Dear Sirs:—Please forward me your Book, as advertised, free.

Experiment in Winter Hog Feeding.

A two months' feeding test has just been completed at Brandon Experimental Farm, in which chopped barley has been compared with shorts as a winter feed for young pigs. The pigs used were early fall pigs, and had received no milk nor any commercial substitute for it. Up to the start of the experiment they had been fed on shorts, barley and feed flour.

They were divided on December 14th into two lots as nearly evenly as possible, there were three Berkshires and one Yorkshire in each lot. They averaged slightly over 70 pounds each at the start. One lot received barley chop and the other shorts; in addition both lots received a small quantity of feed flour and some mangels. The quantities fed daily at the start were; Barley or shorts 2¼ lbs. per pig; feed flour, ¾ lbs. per pig; mangels, 2 lbs. per pig. These quantities were increased as the pigs grew. It was found that the pigs on the barley could use more food and they were consequently given a little heavier ration. The quantities in each case were kept to what the pigs would clean up with relish. The grain feeds were purchased at the following rates: Barley, $15.00 per ton; shorts, $20.00 per ton; feed flour, $28.00 per ton. The mangels were grown on the farm and are valued at $3.00 per ton. The results are as follows:

	Lot 1	Lot 2
No. of Pigs in lot	4	4
Weight at start of test lbs Dec. 14.	292	282
Weight at end of test Feb. 14.	492	425
Gain in 2 months	200	143
Gain per pig per day	.81	.58
Total amount of barley fed	708	
Total amount of shorts fed		637½
Total amount of feed flour fed	248½	248½
Total amount of mangels fed	488½	488½
Total cost of feed	$9.52	$10.58
Cost of feed per 100 lbs. gain in weight	$4.26	$7.40

This is certainly a decided victory for barley. Of course it would not be possible to buy barley at ¾c. per lb., but even if it were the same price as the shorts, the results would still be decidedly in its favor. It is possible that the similarity between the shorts and the feed flour made the ration that contained both, not so palatable and well balanced as the one that had barley and feed flour, and part of the failure of the shorts is due to that cause.

A Royal Warrant.

The L. C. Prime Company, Limited, St. John, N. B., have just received a cable announcing the fact that a Royal Warrant has been issued to the Manufacturers of "Molassine Meal," the well known live stock food.

This means that the Molassine Co. is entitled to call themselves Purveyors to the Royal Family and to use the Royal Arms.

This is perhaps the greatest honor of all of the many that have fallen to this enterprising firm.

MOLASSINE MEAL has been recognized in Great Britain for many years as the leading Live stock Food.

Good Values in Shorthorn Bulls.

Walter S. Eaton, Upper Canard, N. S., writes:—I have lately sold two good young Shorthorn bulls to Agricultural Societies in this Province. Among the bulls offered in my ad. in The Maritime Farmer are some exceptionally good ones.

A One Idea Business

THE business of making Oliver plows is built on one idea: "Satisfy the customer." Nearly fifty-eight years ago when James Oliver was both making plows and selling them to farmers he applied to his business the principle of customer satisfaction, which has since become a fundamental business rule. He built plows, tested them, then sold them, and last of all interviewed his customers to get their suggestions for further improvements. Not many years of such work as this were required to establish Oliver plows in a high place in the estimation of the men who used them. For over fifty-seven years the same idea has dominated the business of building

Oliver Plows

When the plant at Hamilton was erected the problems of Eastern Canadian plowing came up for consideration. As a result of the careful study of those problems and the experimenting that followed it, Oliver plows for Eastern Canada stand in a class by themselves as satisfaction givers.

The line includes walking plows, three-wheel sulkies, walking gangs, hillside plows, high and low lift gangs, and riding cultivators. There are one or two plows in the line which are specially adapted for most Eastern Canadian conditions. Among these are the Oliver 1-C sulky and 1-C gang. In both these plows most of the weight of the plow is carried on the two furrow wheels which, of course, ride on a smooth surface all the time. There is a spring on the land wheel which, in connection with the two bails on which the plow is hung, insures an even depth of plowing.

Oliver plows are handled exclusively in Canada by the International Harvester Company of Canada, Ltd. You can see any plow in the Oliver line at the place of business of the I H C local agent. If you will tell him what kind of plowing you want to do, he can show you the plow that will do your work best. See him for catalogues and full information, or write the nearest branch house.

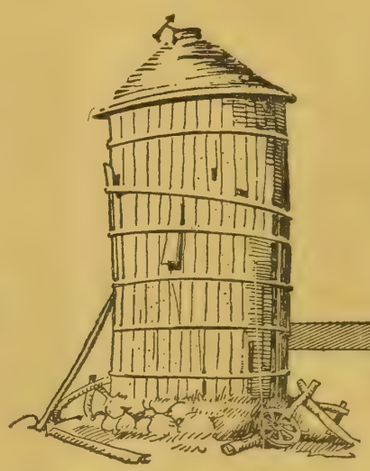
What kind of a silo will yours be?



Wood—or Concrete?

IF you were to build two silos—one of wood, the other of concrete—side by side, and then could see them as they will look after five years of service, you wouldn't have to think twice to decide which is the best material. In a few years more there wouldn't be much of the original wooden silo left—the repairing you'd have to do would be as troublesome and cost as much as the building of an entirely new one. But the passage of five, ten, fifteen or even twenty years will make no difference to the hard-as-rock wall of the concrete silo.

CONCRETE SILOS LAST FOREVER

WIND, rain, fire and lightning are alike defied by concrete. You need no insurance against its destruction, because it *cannot be destroyed.* Concrete silos are best for another reason. The concrete keeps the ensilage at an even temperature, so that it "cures" better, and therefore contains more food-value for your stock.

YOU CAN BUILD ONE YOURSELF

NO matter whether you have ever used concrete or not, you can build a concrete silo. Our book, "What the Farmer Can Do With Concrete," gives all the information you will need, not only about silos, but about scores of other uses for concrete on the farm. It isn't a catalogue, nor an advertising circular. A handsome book of 160 pages, well illustrated, and written for farmers. It is free. Just send your name and address on a postcard or in a letter and the book will be sent free by return mail.

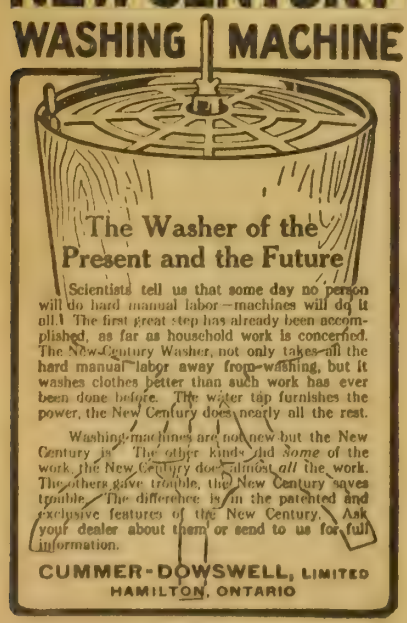
NEW CENTURY WASHING MACHINE



The Washer of the Present and the Future

Scientists tell us that some day no person will do hard manual labor—machines will do it all! The first great step has already been accomplished, as far as household work is concerned. The New Century Washer, not only takes all the hard manual labor away from washing, but it washes clothes better than such work has ever been done before. The water tap furnishes the power, the New Century does nearly all the rest.

Washing machines are not new but the New Century is. The other kinds did *some* of the work, the New Century does almost *all* the work. The others gave trouble, the New Century saves trouble. The difference is in the patented and exclusive features of the New Century. Ask your dealer about them or send to us for full information.

New-Born Foals.

(Continued from page 428)

and in two weeks, or thereabouts, she should have recovered from foaling and be taking her usual feed, grazing grass and getting ready to resume light work in harness.

THE FOALING BOX STALL.

Two 14 by 14 foot box stalls should be kept ready for the use of mares on every farm where foals are raised. No mare should be allowed to foal in an ordinary stall, or unprepared box stall. Navel and joint diseases will not be likely to attack foals born in clean places. An absolutely clean foaling place is necessary and should be prepared as follows:—

Remove and burn all loose litter and manure. Cleanse and scrape the floor; then saturate it with a 1-50 solution of coal tar disinfectant, or a solution of 4 ounces of sulphate of copper (bluestone) to one gallon of hot water. Scrub and cleanse the walls with a similar solution of coal tar disinfectant or a 1-1000 solution of corrosive sublimate. Cleanse the ceiling in the same way; then apply to walls and ceiling fresh made lime whitewash, to each gallon of which has been added one-third of a pound of chloride of lime. Cover the floor with fresh, dry planing mill shavings in preference to any other bedding material. Remove manure as soon as it is dropped.

When the foal is born and has been cared for and the afterbirth of the mare has come away, remove the mare and foal to the second box stall, prepared as was the first. Then clean out, disinfect and whitewash the stall just used and put in fresh, clean dry shavings in readiness for the reception of the next mare. The mare must always occupy a clean, specially prepared box stall and it should be perfectly ventilated and as sunny as possible.

Where but one box stall is available clean it out, burn the afterbirth and soiled bedding, use a disinfecting solution freely on the floor, and put in plenty of fresh, dry, clean shavings as soon as possible after the birth of the foal. If the mare foals on grass treat the foal as if it had been born in the stable. Navel infection is less liable to occur on grass, but this is possible, and preventive treatment, therefore, is necessary, no matter where the foal is dropped.

TREATMENT OF FOAL AT BIRTH.

Attend to the navel cord (umbilicus) as soon as the nose of the foal has been cleared of afterbirth. If possible avoid tying the navel cord. It is best for it to break off naturally. If it fails to break and the mare is lying down, make her get up and the cord may break.

If found necessary to tie the cord, use a clean disinfected string. A dirty string may cause infection. Soak the string in a five per cent. solution of lysol or carbolic acid, or a 1.500 solution of corrosive sublimate (bichloride of mercury). Tie the cord one inch or a little more from the belly: then sever the cord with a clean knife. An emasculator or esseur (castrating instruments) may be used to sever the cord in place of tieing it and then cutting through below the knot.

Saturate the stump of the navel cord immediately, whether tied or not, with the following disinfectant; Powered corrosive sublimate, 2 dr; boiling water, 1 pint. When it has cooled, color the solution with 2 drachms of tincture of iron, label the bottle "poison," gnd keep it out of the way of children. Repeat the application twice a day until the cord shrivels up, drops off, and no raw

Is This Offer Fair?

You do not risk a cent. You must be either delighted with this tea's rich, mellow flavor, or else your dealer wants you to take advantage of this guarantee:—

You have only to return the broken package to get your money back, if you do not like the flavor exceptionally well.

35c., 40c. and 50c. per lb.

MONEY IN POTATOES

$48.00 per acre
OR

$128.00 per acre
WHICH?

When it comes to a difference of $80 an acre on a potato crop, let us take off our hats to the Potato experts.

They can show a practical farmer how to turn an average crop of 120 bushels per acre into a bumper crop of 240 bushels. Simply changing a few old methods of potato growing does it. In this day of high prices, that means $128.00 per acre clear profit instead of $48.00—a difference of $80.00.

The big profit is on the extra bushels because the first cost remains the same.

How experts worked it out through years of experimenting is told in simple words in our little book "Money in Potatoes." A book full of sound ideas—no theory. Every difficulty you could have in potato growing is dealt with.

With this book to refer to you can double your potato crop. Send in the $80.00 coupon for a free copy to-day. 17

Free Barn Plans

to any Farmer of good standing by the "LOUDEN" Barn Architect

If you are going to build a new barn or re-model an old one—tell us your needs. Our special barn architectural department will send you plans FREE.

No! we are not in the barn building business, but having been 47 years in close touch with the farmers' needs and requirements and helping farmers to lay out their barns, we have secured a wide experience, which in the interests of good farming, we will gladly pass on to any Canadian farmer of good standing. Write us regarding your building requirements.

THE NAME

LOUDEN

has been connected with Barn Equipments and Barn planning for over 47 years. We make a special study of means to save time, save labour, and save money for the farmer.

Every up-to-date Farmer should have this Book

It describes and illustrates the full line of Louden Hardware Specialties for the farm. You will find it a handy book of reference.

Write for free copy to-day.

PERFECT BARN EQUIPMENTS

The LOUDEN MACHINERY CO.
Dept. 50 - GUELPH, Ont. 5

spot remains. To keep the solution from blistering the foals' belly smear carbolized vaseline or unsalted lard around the navel before making the first application.

A good way to use the solution is to put some of it in a shallow, wide-necked bottle, then hold the bottle against the foal's belly with the navel stump immersed so that it will be completely covered by the fluid. If the navel cord has been tied remove the string as soon as possible, squeeze out the blood clot and instantly soak the navel stump with the corrosive sublimate solution. Use the solution twice a day until the navel is perfectly healed. Remove sloughing portions of the cord each morning, so far as possible, to allow the solution to wet all raw parts of the cord.

GIVE ATTENTION TO THE BOWELS.

A strong foal will be on its feet trying to nurse in less than an hour from birth. Such a foal needs no help, but a weak one will have to be held up to suck until strong enough to do so without help. Wash the udder of the mare with a lukewarm two per cent. solution of coal tar disinfectant and then rinse off with warm water before the foal is allowed to suck for the first time. The external organs (gentials), tail and hind parts of the mare should be washed with a similar solution once a day for the first week or so after the birth of the foal.

Keeping the udder free from infective matter in this way tends to prevent the foal from scouring, for that condition of the bowels often is due to germ infection of the intestinal tract by way of the mouth. Disinfection of the navel cord also tends to prevent scouring. At birth the intestine of the foal contains a sticky mass of fecal matter (meconium). This should come away promptly and usually this is accomplished by the first milk (colostrum) which possesses purgative properties. To assist nature, either insert a small tallow dip candle (made for this purpose) in the foal's rectum, or, within an hour after birth, give an injection of either warm water, warm slippery elm bark tea, flax seed tea, sweet oil, or a mixture of equal parts of cream, molasses and warm water, and repeat in twelve hours if required. Harm may be done by injecting a large quantity of strong soapy warm water with an ordinary horse syringe."

Fountain syringe is to be preferred and small, hard rubber nozzle, or a small clean rubber hose and funnel. Smear vaseline or lard on the nozzle and in the rectum before giving the injection. If the bowels do not move within twenty-four hours from birth and the foal seems sick, shake up two to four tablespoonfuls of pure castor oil and sweet oil, according to size of foal, and give as one dose. Then continue the injections at intervals of six hours.

In case the mare dies or has no milk the foal may be raised on cows' milk, if the attendant conducts the work patiently and intelligently. Choose the milk of a cow that has recently calved, preferably one which gives milk low in butter fat, for mares' milk while rich in sugar is poor in fat. Sweeten the milk with molasses or sugar and dilute with warm water. Give a little of this prepared milk at short intervals from a scalded nursing bottle and large rubber nipple. Be careful to keep the bottle and nipple scrupulously clean. Add an ounce of lime water to each pint of the prepared milk, and allow half a cupful once an hour at first.

As the foal grows, gradually increase the amount of milk fed and lengthen the intervals between meals. In a few days food may be given six times a day and later four times daily. The foal will soon learn to drink from a pail if allowed to suck the attendant's fingers at first.

Until the bowels move freely, give rectal injections night and morning. If the foal scours at any time give two to four tablespoonfuls of a mixture of sweet oil and pure castor oil shaken up in milk and stop feeding milk for two or three meals, allowing sweetened warm water and lime water instead. Let the foal lick oatmeal as soon as it will eat, and gradually increase the amount and add wheat bran. In five or six weeks some sweet skim milk may be given and the amount gradually increased daily until in three months or so it may be given freely three times a day in place of new milk. The foal at this age also will be eating freely of grass, grain and bran.

At all times supply pure cold drinking water. Let the foal run out in a lot or grass paddock for exercise. Accustom it to be handled daily. Feed small quantities of nutritious food often, keeping all food vessels clean, and the foal should thrive and develop well.—Agricultural Station, Madison, Wisconsin.

SPRAYERS

For large or small orchards, market gardens, potato farms, grain, mustard, tobacco, home and garden work, poultry plants, whitewashing, cleaning, cold water painting, etc. From *Bucket, Knapsack* and *Barrel Sprayers* to *Traction* and 50, 100, 150 and 250 gallon *Power Sprayers*—complete or in parts to build up. Sprayers already in use. 40 combinations.

They have outside pumps, no corrosion. Unit sprayers, so you can build bigger when necessary. Ask your dealer to show them and write for new booklet, "*Spraying Vines, Trees and Bushes.*" We also make full line potato machines, garden tools, etc.

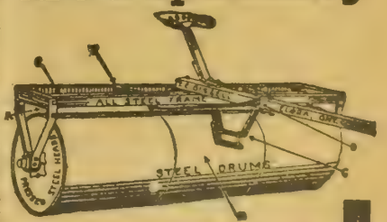
"Bissell" rollers are a specialty



The "Bissell" Rollers are built by men who have made a life study of this work, and are SPECIALISTS IN THE BUSINESS. Search as you may, there are no such perfect Land Rollers on the Continent as the "Bissell." Make a note of these points and compare the "Bissell" Rollers with any other Land Roller in America. If the "Bissell" does not convince you that it is the best Roller, then don't buy, but you ought to know the facts, and it will do any person good to make the comparison. No need to send special travellers to sell "Bissell" Rollers. Practical farmers see the difference and prefer the "Bissell."

The 18 cold rolled anti-friction Bearings ⅛ inch thick with lathe cut ends, held in the one piece Malleable Iron Cage, is a single point placing the "Bissell" Roller away ahead.

Look for the name "Bissell" on every Roller. No other is genuine. Ask Dept. M for free catalogue. 61

T. E. BISSELL CO., ELORA, ONT.

Soil Characteristics.

(Continued from page 419.)

1844, the average yields for the ten years 1892 to 1901 were 12.3 bushels per acre on Plot 3 (unfertilized) and 31.8 bushels on Plot 7 (well fertilized), but the amounts of both nitrogen and phosphorus in the subsoil (9 to 27 inches) were distinctly greater in Plot 3 than in Plot 7, thus showing that the higher yields from Plot 7 were due to the fact that the plowed soil had been enriched. In 1893 Plot 7 contained per acre in the surface soil (0 to 9 inches) about 600 pounds more nitrogen and 900 pounds more phosphorus than Plot 3. Even a rich subsoil has little value if it lies beneath a worn-out surface.

METHODS OF LIBERATING PLANT FOOD.

Limestone and decaying organic matter are the principal materials the farmer can utilize most profitably to bring about the liberation of plant food.

The limestone corrects the acidity of the soil and thus encourages the development not only of the nitrogen-gathering bacteria which live in the nodules on the roots of clover, and other legumes, but also the nitrifying bacteria, which have power to transform the insoluble and unavailable organic nitrogen into soluble and available nitrate nitrogen.

At the same time, the products of this decomposition have power to dissolve the minerals contained in the soil, such as potassium and magnesium, and also to dissolve the insoluble phosphate and limestone which may be applied in low priced forms.

Tillage, or cultivation, also hastens the liberation of plant food by permitting the air to enter the soil and burn out the organic matter; but it should never be forgotten that tillage is wholly destructive, that it adds nothing whatever to the soil, but always leaves the soil poorer. Tillage should be practised so far as is necessary to prepare a suitable seed-bed for root development and also for the purpose of killing weeds, but more than this is unnecessary and unprofitable in seasons of normal rainfall; and it is much better actually to enrich the soil by proper applications or additions, including limestone and organic matter (both of which have power to improve the physical condition as well as to liberate plant food) than merely to hasten soil depletion by means of excessive cultivation.

The Annual Report of the N. S. Secretary for Agriculture.

The Annual Report of the Secretary for Agriculture for Nova Scotia for the year 1912 has just been issued and is now available as long as the copies last for free distribution on application to the Secretary for Agriculture or to any of the members representing the counties of Nova Scotia.

The report consists of an outline of the year's work in the Department of Agriculture including Exhibitions, Agricultural Societies, Farmers' Associations, Field Crop Competitions, Meetings, Dairying, etc., and also the report of the work at the Agricultural college showing the progress that has been made in the various Departments of this Institution.

Besides this matter dealing with the routine work of the Department and the College, the Report contains a series of articles on Swine Breeding in Nova Scotia. This series is a continuation of the series of articles which have been appearing in the report of the Secretary for Agriculture since 1907. These previous reports have dealt with Sheep Raising, Dairying, Soils and Soil cultivation, Orcharding and Horse Raising. As in previous years, the series of articles on topical subjects are being printed in separate cover and may be secured either by themselves or under the same cover with the General Report of the Secretary for Agriculture. We may state that any who have not received copies of the previous reports may get them on application to the Secretary for Agriculture at the same time when they apply for a copy of the present Report of 1913.

The series of articles on Hog Raising includes a description of the various breed of swine, methods of feeding, care, breeding, etc., and there is also a valuable article on the Housing of Swine which contains plans of various types of houses recommended for keeping of swine. The series is concluded with a splendid article on Diseases of Swine and Their Treatment. The whole series is a valuable one and should be in the hands of everyone interested in swine breeding and feeding in the Province of Nova Scotia.

A limited number of these reports are also available for distribution outside of the Province. Those who are interested should apply to M. Cumming, Secretary for Agriculture, Truro, Nova Scotia.

ROOFING

Description of some of the More Important Varieties af White Oats.

BANNER.

The panicle is of medium size but well supplied with upstanding productive branches. The spikelets are long with narrow glumes. The grain belongs to the long type with a somewhat drawn-out tip, but otherwise plump and well filled with a relatively thin hull. The degree of stooling is medium, while the straw is long and quite elastic. This sort ripens medium early or a few days later than six-rowed barley. As regards yield, this variety occupies a front place and is most in demand at present over Canada generally. It thrives in a great variety of soils.

SIBERIAN.

This sort resembles quite closely the above variety in many particulars. The kernal is quite similar in type, as is also the panicle and character of straw. In some districts, it is said to give a slightly higher yield than Banner, although in others the reverse is the case. This sort has not obtained nearly so wide a distribution over the country as a whole as has the latter sort.

LIGOWO

This oat possesses a grain of fine quality, being exceptionally large and plump with a relatively thin hull. The awn is usually coarse but falls off easily. The spikelets are inclined to be three kernelled. This sort ripens considerably earlier than Banner and can therefore often be cultivated to greater advantage where early maturing sorts are desired. The sraw is of medium length and of fine, firm quality, thus rendering the sort eminently suited for cultivation on rich, vegetable soils. On drier soils, the stand is liable to become too thin and the yield of both srraw and grain lower. Under proper conditions, the yield of this sort is good.

DAUBENEY.

The panicle is rather small with stiff, upright branches. The spikelets are small and ordinarily two kernelled. The grain is comparatively small and unattractive, yet quite plump and with a relatively thin hull. At the Ontario Agricultural College, Guelph, and at Macdonald College, Ste. Anne de Bellevue, Que., it stands among the very highest yielders, although at other stations, it does not occupy quite so high a place. The greatest virtue of this sort is its ability to mature early, ripening as it does about the same time as our common varieties of six-rowed barley. For this reason, it is highly recommended in Ontario and Quebec at least, as a sort suitable for growing in a mixture with barley of the above class. The straw is rather short but abundant and of good quality.

ABUNDANCE.

This sort enjoys a high reputation in many parts of Canada, especially in those districts where a relatively early variety is desired. The grain is of fine quality, being large and plump with a relatively thin hull. The panicle is comparatively large and rich, pyramid-like in contour, with upright, spreading branches. The spikelets are inclined to be three-kernelled, and rather broad. This sort usually ripens from 4 to 6 days before Banner, hence its popularity in certain districts as above mentioned. The straw is of good length and strength and of fair quality.

Annapolis Valley Fruit Farm.
228 Acres, Only $1900

Bldgs. worth more than price asked; good 8-room house; nearly new 40x60 ft. barn, ties 20 head stock, holds 70 tons hay; 40 acres rich tillage, fine for potatoes, hay, grain and apples; 20 young trees now set; wood and timber will make new owner rich; wire-fenced and spring-watered pasture for 25 head; near neighbors, schools and all advantages; owner has other farms, must sell one; a big snap to quick buyer; part cash; for traveling instructions write Box D., Sussex, N. B.

The Maritime Horse Show.

Although the first show was held only a few years ago it is now one of the events which is eagerly looked forward to. From the first it seemed to meet a long-felt want.

Coming as it does at a time when our noblest of animals are looking their best, and man is glad to take a holiday before the struggle of a summer toil and the fair sex are resplendant in Easter bonnets and spring suits it offers a rare combination of profit and pleasure.

The promptness with which horsemen from all parts of the Maritime Provinces have come forward with their good ones, the readiness they have displayed in adopting up-to-date equipment all speak volumes for the future of this popular show.

Nor is this true of the "light horse" alone. Perhaps nowhere has progress been greater than in the farmer's horse. Last year farmers' "teams," and "four-in-hand" were such as to elicit exclamations of surprise and praise from gentlemen who are in the habit of attending much larger and older shows.

The management are to be congratulated on the rapid growth of this show. From the first it has been their aim to give the visitors value for their money.

The events are brought on promptly and with no confusion. A first class band is in attendance and the events are interspersed with music.

To those who want to gain knowledge and enjoy a holiday we know of no better place than at the Maritime Horse Show at Amherst.

Hogs in the Orchard.

On July 1st we turned into our orchard three shoats weighing 100 lbs. each. One month later we lost the smallest one. We fed them milk twice daily and for the first month about four quarts of grain. When the apples began to fall we stopped feeding the grain and when there were more apples than they could pick up daily we omitted the milk. They had access to running water, and on September 1st they weighed 250 and 225 pounds respectively. They turned over about two acres of ground which we wished to plow as a means of improving the orchard. We find money in hogs.

Wheat and Rye for Pigs.

"How do entire ground rye and entire ground wheat compare in slop for growing pigs?"

Experimental evidence indicates that entire ground wheat is superior to entire ground rye for making gains on hogs of various ages. However, from the composition of the digestible nutrients of the two grains, rye contains a higher per cent of the more important food nutrients for growth. Since rye contains a higher per cent of phosphorus, which is essential for bone growth, it is doubtless of greater value for young growing pigs than for more mature hogs. On the whole, there is apparently little difference in the feeding value of entire ground wheat and rye of the same quality for growing pigs.—Herbert W. Mumford, University of Illinois.

Amatite ROOFING

Why Practical Men Demand Amatite

ROOFING that needs paint every two years can't hold the market against Amatite—which *needs no paint whatever.*

Practical men know the great advantage of a roof that *needs no painting.* They know what a nuisance the painting is. They know how much it costs. They know how liable they are to neglect to paint their roofs at the proper time.

Painted roofings are waterproof only where the paint is. Amatite is waterproof all the way through.

Amatite is sold in the usual convenient rolls of 110 square feet with a smooth lap where the mineral surface is omitted, so as to secure a tight joint. Nails and cement are packed in the center of each roll.

Free sample and booklet on request to nearest office.

Big Ben

The Men Who Make Big Ben

About 26 years ago a German clockmaker came from the East to La Salle, Illinois.

His only baggage was an idea—the plan of an automatic process he had invented, and which would make more alarm clocks and better alarm clocks than hand labor could ever hope to turn out.

With the backing of some local merchants and with a handful of clockmakers, a small factory was started on the edge of the town. —Beginnings were hard, competition intense. They weathered storms that would have knocked the fight out of weaker hearted men.

But when success at last came in sight they had built one of the best equipped clock plants in the world and one of the greatest names in the American clock industry—*Westclox, La Salle, Illinois.*

Today, the Westclox people number 1,200. Every week day of the year they turn out 10,000 alarm clocks—alarm clocks of every description and style — their name "Westclox" is on every one of them and *Big Ben* is the king of them all.

Big Ben is the ideal of the Westclox people. He is their conception of what a perfect alarm clock should be. He is only two years old, but in this short time 6,000 Canadian dealers have already accepted him.

Only the finest materials are used in his making. He is strong, massive and practical. His face is frank, open, easy to read. His keys big, handy cass to wind. He rings steadily for five minutes or intermittently for ten. He costs you $2.50 at any time you say. If you have time enough every other year, there is no telling how long he will last.

Big Ben's price is $3.00 at any dealer's. If you cannot find him at your dealer's, a money order sent to *Westclox, La Salle, Illinois,* will bring him to you, carefully packed and express charges paid.

Feed Value of Roots.

In a recent talk on the feed value of roots, Prof. G. E. Day, of the O. A. C. said that usually the feeding value of roots is based on the dry matter contained in them. He seemed, however, to agree with the view of those who hold that even the water in roots is not without special value in the ration.

Taking dry matter alone as the basis of value roots are not equal to corn. Experiments carried on in Maine showed a return of only 3,415 lbs. of dry matter per acre from Swede turnips as compared with 5,580 from fodder corn. Pennsylvania experiments showed 4,554 lbs. of dry matter from mnagels and 6,783 from corn. Ontario experiments showed 5,034 lbs. of dry matter per acre from mangels and 8,135 from corn.

SILAGE SURPASSES ROOTS IN MILK PRODUCTION.

A table given in Henry's Feeds and Feeding, quoted by Prof. Day, would also indicate that the dry matter in corn is more effective in milk production than is that in roots. This table shows the number of pounds of milk obtained per 100 lbs. of dry matter fed in roots and corn respectively at various experimental stations:

Station	Root Ration.	Silage Ration.
Ohio, 1889	59 lbs.	62 lbs.
Ohio, 1890	59 lbs.	60 lbs.
Ohio, 1891	62 lbs.	66 lbs.
Ohio, 1892	69 lbs.	76 lbs.
Pennsylvania	87 lbs.	82 lbs.
Vermont	113 lbs.	119 lbs.

It will be observed that in all cases, save one, that of Pennsylvania, the dry matter in corn gave a better return in milk than did the same weight of dry matter in roots. It is, as Prof. Day said, difficult to understand this unless the dry matter in corn was wrongly estimated. The dry matter is calculated by expelling all possible moisture and then weighing what remains.

The experiment station at Cornell also found that 1 lb. of dry matter in mangels is slightly superior to 1 lb. of dry matter in corn silage. Also that 1 lb. of dry matter in mangels is equal to 1 lb. of dry matter in grain, and that mangels may replace half the grain ordinarily fed in a ration composed of grain, mixed hay and silage. At the Copenhagen Station very extensive trials go to show that 1 lb. of dry matter in roots is equal in feeding value to 1 lb. of Indian corn, mixed grains or three-quarters of a pound of cotton-seed meal.

The results of tests quoted above are not exactly uniform, yet they all point to one thing, namely, that for dairy cows, the dry matter of roots is not materially different in feeding value from the dry matter in other foods.

SILAGE BETTER THAN ROOTS IN FATTENING.

At the Ontario Agricultural College, roots have been fed in comparison with corn silage for fattening steers, and in all cases the roots did not make so good a showing, pound for pound, as silage. In one series of tests, silage showed 25 per cent higher value per ton than roots, and in other tests the difference in favor of silage was greater.

A review of British methods of steer feeding shows a very heavy use of roots as high as 150 lbs. per steer per day in some cases, accompanied by a comparatively light meal ration. The comparatively low cost of labor in Britain, and the high price of concentrated food, renders it advisable for the British farmers to use roots as a substitute for a large portion of the meal ration. In this country such a practice would not be the most economical, more especially because we can raise corn for silage better than they can in Britain, and corn silage has been shown to be a cheaper food than roots for fattening steers.

At the Michigan Experiment Station sugar beets gave better results than corn silage for fattening lambs, but turnips were scarcely equal to silage.

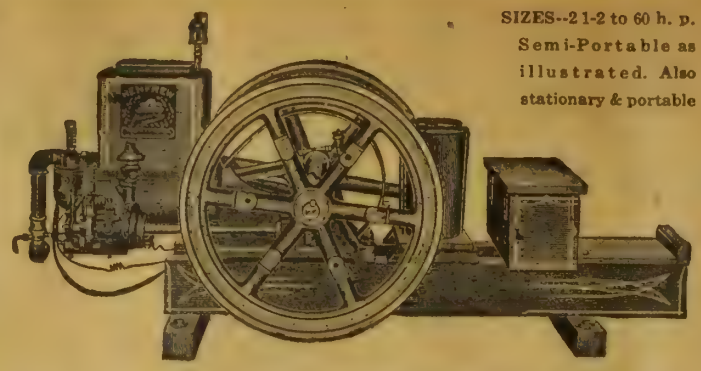
At the Iowa Experiment Station mangels were fed against corn silage. The daily gain was slightly in favor of mangels, and the grain consumed for 100 lbs. gain was less for the lot receiving mangels, but the lower cost of corn silage made it the more economical food of the two. In Great Britain, roots are used very liberally in sheep feeding, and the quality of sheep produced in that country speaks well for the suitability of the ration.

ROOTS IN HOG FEEDING.

The average results of feeding roots to hogs at five Experimental Stations show that 100 lbs. of grain were replaced by feeding 557 lbs. of roots. In tests at the Ontario Agricultural College, our best showing for roots was 442 lbs. of roots equivalent to 100 lbs. of grain, which may be regarded as an abnormally high value for roots.

In extensive feeding trials in Denmark it was found that one pound of ground barley was equal to 7.5 lbs. of mangel beets containing 11 per cent dry matter and 6.7 per cent. sugar.

The very high return from feeding roots at the Ontario Agricultural College is due probably, Prof. Day said, to the fact that the hogs which were not fed roots received an exclusive meal ration, and the roots appeared to stimulate the appetite and aid digestion, which was shown in the more thrifty appearance of the root-fed hogs. In the Danish trials, dairy by-products were fed to all the hogs, and hence the roots do not show to as great advantage, the dairy by-products giving the desired variety in the ration of the hogs which received no roots. It has also been found



SIZES--2 1-2 to 60 h. p. Semi-Portable as illustrated. Also stationary & portable

Factory Methods On The Farm

THE modern manufacturer and the modern farmer use strikingly similar business methods. The modern manufacturer is always on the look-out for labor-saving machinery for his factory—machinery that will do the work in less time and at less expense. The modern farmer is also on the watch for labor-saving machinery for his farm.

Renfrew-Standard

And of all the labor saving farm machinery, what can excel the gasoline engine? It saws wood faster than a hired man can saw it. It pumps water for the cattle quicker than he can pump it. It shells the corn faster, grinds the feed quicker. It will run the fanning mill and the emery wheel for you. It will run the cream separator, the churn and the washing machine for your wife. If desired, it will furnish the power to light your home or barn with electricity.

A good engine will produce gasoline power at a fraction of the cost per hour you would pay for man-power. Therefore it is good business to use gasoline-power wherever it is possible to substitute it for man-power. That's what the modern manufacturer would do if he brought his factory methods to the farm.

A good gasoline engine, such as the ***Renfrew-Standard***, will soon pay for itself. And it will last for years. It's built to last. It is so perfectly balanced and runs so steadily that it requires no anchoring.

Main bearings are of anti-friction metal. Cylinders are of close grained semi-steel, like those used in high grade auto engines.

The carburetor consists of but three parts. Nothing about it to confuse the operator or get out of order. The governor, which is the fly-ball type, like that of a steam engine, permits the speed to be varied while the engine is running. And you can start the engine easily without cranking in cold or warm weather.

The ***Renfrew-Standard*** is the latest and best type of gasoline engine sold in Canada today. A booklet giving complete description will be mailed promptly on receipt of your name and address. Just drop us a card by next mail. Also ask us about the Gifford 1 1-2 h. p. engine---truly a wonderful little engine.

EWING'S RELIABLE SEEDS

The Germs of Life are Vigorous

in Ewing's Reliable Seeds—and so are the Vegetables, Field Crops and Flowers grown from them.

This is not merely a claim—it is a *proven fact*, which has been demonstrated annually, for for over forty years, by thousands of Canadians.

Don't stake your time, trouble, expense, and the season's use of your land, on an uncertainty. Get Ewing's Reliable Seeds and be *sure* of good crops.

WM. EWING & CO., Seedsmen

McGILL ST., MONTREAL. 27

EWING'S RELIABLE SEEDS MONTREAL

that the hogs fed equal weights of roots and meal produced a better quality of bacon than those fed grain alone.

Another important point brought out by Prof. Day, based on experiments carried on in Utah, was as to the effect of roots on dressed weights of carcass. In all cases, in these experiments, it was found that the shrinkage of cattle, sheep and hogs, was greater in killing where roots were a part of the ration than where they were not. But this might be accounted for by a fact that tells in favor of root feeding. In all cases root-fed animals showed more blood and heavier vital organs than those which had not had roots. More blood and stronger vital organs means, of course, greater vitality, a most important factor either in breeding or feeding stock. While, wherefore, roots may not possess as great feeding value as one would expect, this is probably more than made up for in the greater thrift they produce in animals to which they are fed.

Even the feeding value depends, in large measure, on where and how roots are used. Where the rations of hogs, say, contain considerable quantities of buttermilk or milk, the addition of roots need not be expected to show any marked results. On the other hand, where a ration lacks succulence the addition of roots will produce results out of proportion to their real feeding value.

Very little, if any, actual experimental work has been done in connection with feeding of roots to horses, but every horseman knows, said Prof. Day, the beneficial influence of a few roots, especially in the case of idle horses. Probably their laxative action is their main feature.

SILAGE FOR SHEEP AND HORSES

Questioned as to silage for sheep Prof. Day said that some men had good results from this sort of feeding while others declared they would not have it at all. For his own part he preferred roots to silage in the case of sheep. Still in one case a sheep belonging to the A. O. C., when apparently about to die, was given silage when it would take nothing else, and from that time on it began to mend. Roots are, however, safer than silage in the case of sheep, because they vary less from year to year. If silage is put in too green it will develop too much acid to make it safe for sheep, but if it is well matured it may be all right.

"What about silage for horses?" Prof. Day was also asked.

"We have fed some when short of roots," was the answer. "But in feeding silage, it is necessary to be absolutely sure there is no mold on it. Mold of any kind is exceedingly dangerous for horses."

CARROTS OR MANGELS FOR HORSES.

"What about carrots for horses?" came next.

"Our experience is that it matters little whether you use carrots, mangels or turnips, all are good," was the answer.

"What of apples for stock?" asked Geo. E. Fisher, canner and fruit grower

"If my memory is right," answered Prof. Day, "they have more water and less dry matter than roots; but, provided there is not too much acid, they should be valuable in proportion to their dry matter content."

Mr. Fisher said that sour apples really contain more sugar than sweet apples. Sweet apples are without sugar to turn to acid. Consequently sour apples have, he contested, greater feeding value.

"Perhaps you are right," said Prof. Day, "but I should fear the effect of the acid on the kidneys of the animals."—Address by Prof. G. E. Day.

MOLASSINE MEAL

Made in England

is made in England and is recognized by the leading veterinary surgeons in Great Britain—used in all mounted departments of the British Army—large Cartage Companies—Omnibus Companies—and all owners of horses having heavy work to do or for show or breeding purposes. It is

Look for this Trade Mark

on every bag

A Splendid Economical Feed for Horses, Cattle, Sheep and Pigs

"MOLASSINE MEAL" is not only a good food itself but enables the animal fed on it to obtain the full nourishment from all other food. When MOLASSINE MEAL is fed regularly three times a day, you have no waste fodder of any kind. It costs you less for feed and the animals obtain more nourishment.

Get some from your dealer to-day. If he has not got it, write and let us know at once.

Ridding Ewes of Ticks.

"Fifteen ewes will lamb in May. They are infested with ticks. Is it safe to dip in winter when they have heavy fleeces? Would a strong solution of stock dip kill the ticks? Will ewe lambs less than one year old breed?"

Since the ewes are to lamb in May, it is probaly best not to dip them, but to shear them about April 15. A great many of the ticks will be removed in the process of shearing and generally the remainder disappear shortly after the fleeces are removed. After warm weather comes, the ewes and the lambs should be dipped twice, the second dipping following the first in about two or three weeks. Any of the proprietary dips will kill ticks, if the directions of the company making the dip are followed. It is comparatively safe to shear the ewes at the time stated if adequate shelter is available and if the operator is careful in the process of shearing. Well grown, vigorous ewe lambs usually will breed in the later autumn months.

University of Illinois.

Many sufferers from rheumatism have been surprised and delighted with the prompt relief afforded by applying Chamberlain's Liniment. Not one case of rheumatism in ten requires any internal treatment whatever. This liniment is for sale by all dealers.

Double Crops for Roughage.

Let the reader remember that the following system of double-cropping is not especially exhaustive on soil, the products not being allowed to thoroughly ripen, as more vitality would be sapped from the land while they were maturing and the grain was filling and ripening. Of course, under such cropping the soil should be well cultivated, fertilized as often as practical and systematic crop rotation practiced to avoid rubbing the land. Ground on which this double crop was grown one season produced 65 bushels of corn to the acre the following year.

Preparing the ground as early in the spring as possible, we sow oats at the rate of about three bushels to the acre (more or less, according to the fertility of the land). Heavy disking will do in preparing the seedbed, but thorough stirring is better. Also broadcasting the seed will give satisfactory results, but we find drilling more profitable as the oats then will withstand any drought that may occur. While the grain is the "milk" to the "dough" stage we mow the oats, raking them and putting them in shock to prevent scorching by the sun; then haul and stack or mow them away for winter feed. By this early cutting the whole product retains the rich flavor and natural succulence, the tender blades are not brushed off nor blown away as in other hay and the roughage is entirely cleaned up by the stock. At the same time there is sufficient grain in it to make the feeding of other grain unnecessary. This is one of the finest feeds we ever had any experience with, being especially adapted to dairy feeding on account of the "milk" cured and stored away in the grain. It is also very fine for younger stock.

Just as soon as we can get this first crop off the field, we again prepare the land for seeding and sow with a mixture of millet, oats and corn (about a half-bushel of millet to the acre, the remainder of the seed being in whatever proportion the land seems adapted to growing). Many object to millet as a roughage, but I have found it good if cut early enough. If it is allowed to grow up rank and heavy with grain, it is an undesirable feed for the stalks are hard, dry, tasteless and with very little nourishment in them. This ripening of grain anh stalks is also most exhaustive on the soil. But by cutting millet just as it is filling the heads, there will not be too much grain in it, while the plant itself will possess those admirable and most nourishing qualities above mentioned in the oat-hay—tenderness, succulence and richness of flavor. We have taken yearling calves through the winter with practically no other feed but these two roughages; one-half of oat-hay and the other half of millet, corn and oats combined. No other grain was supplied except what was on these products and we feel that the cheapness with which it was produced will recommend it to all in these times of high priced roughage. —M. Coverdell.

220-Acre Fruit and Grass Farm
$3050 Income Last Year

Borders water offering best of salt water advantages; good 8-room house with running water; 40-ft. barn; near P. O., boat landing, store, etc.; apple orchard producing 600 bbls. in season; variety small fruits; good chance to develop large commercial orchard; cuts 30 tons hay; wood and timber valued at $1000; owner an old man must sell; if taken immediately price only $3200, part cash; for all details and traveling instructions to see this and many other farm bargains throughout Nova Scotia and the N. E. States, see page 67, our "New Mammoth Farm Catalogue No. 36," just out; beautifully illustrated and filled with a wonderful assortment of money-making farms; send today for your free copy, it will save you lots of time and money. E. A. Strout Farm Agency, Station 2612, 294 Washington St., Boston, Mass.

A World's Ayrshire Record.

On March 2nd, 1913, the Ayrshire cow, Daisy of Ferndale,—26735, qualified in the Canadian Record of Performance test with 15533.9 pounds milk and 578.17 pounds butter fat, equal to 687 pounds butter, given in 365 days and is due to freshen April 25th, next.

This cow is owned by W. C. Tully, Athelstan, Que., and was slightly over 4 years of age when she entered in the test.

Mr. Tully is a young man, who started selecting and breeding Ayrshires two years ago and is to be congratulated on his success, as he has also a number of other cows making good records.

This cow now holds the yearly record for milk and butter in the 4 year old class, outstripping Bessie, of Rosemount, owned by Geo. A. McFadden, Bryn Mawr, Pa., that held for some time the world's record with 14102 pounds milk and 587.17 pounds fat.

What is a Good Boar Worth ?

Several hundred dollars is not too much to value a good boar. Figure it this way: An Indiana subscriber writes that he raises 500 to 800 hogs a year which he markets at seven to eight months of age, when they weigh 200 pounds. With corn at 60 cents per bushel, middlings $26 and bran $24 per ton, it costs him five cents per pound to produce his pork.

A New Jersey farmer tells us his pigs average 240 pounds at this age and cost 4½ cents a pound to produce, feed being $1 a ton higher than in Indiana.

At 8 cents per pound the extra 40 pounds is worth $3.20, while the saving of ½ cent per pound in cost of production means $1.20 more, or $4.40 on each hog. If through the use of better breeding stock this gain could be made on 500 hogs yearly it would mean $2200 extra income—enough to buy several good boars and an automobile.

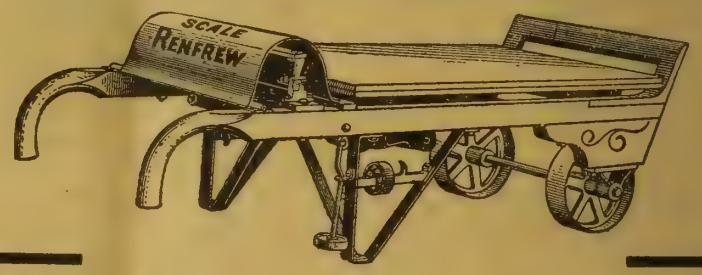
Lambing in New Zealand.

New Zealand farmers have been favoured with exceptionally fine and dry weather for the lambing season, and are rejoicing over the high percentages they are getting. The latest reports from the North Island estimate the crop of lambs at from 15 per cent to 20 per cent above the average. Some phenomenal returns are recorded. In many large flocks 120 per cent. and upwards have been docked and marked, while one flock of Romney-Lincoln ewes is credited with 175 per cent., of which the first 90 lambings were twins. The lambing season is a few weeks later in the South Island than in the North, and only a few returns are as yet available, but, as the weather was favorable and grass abundant, large percentages are expected.

Lrce on Live Stock.

At this season of the year many farmers are troubled by having the cattle and horses covered with lice. Lice are easily killed. Insect powder can be sifted into the hair and will kill the lice. Kerosene emulsion or a solution of creolin to fifty parts of water is good. Kerosene emulsion is prepared by using one-half pound of hard, soft or whale-oil soap, one gallon of boiling water and two gallons of kerosene. Dissolve the soap in the water, add the kerosene and churn for five or ten minutes. Use one part of this solution and twelve parts of water.

"WHEEL THE SCALE TO WHAT YOU WANT TO WEIGH"



THE "RENFREW" HANDY TWO WHEEL TRUCK SCALE

SAVES MONEY FOR FARMERS AND DAIRYMEN

Thousands of farmers are losing money yearly through the inaccuracy of their scales.

It was to protect the farmers against these losses that the Renfrew Truck Scale was designed and built.

And it does protect them, by being absolutely accurate.

Gives the farmer ALL his profits on everything he sells by weight.

Saves for him time and labor,—simply wheel the scale to what you want to weigh.

Weighs everything from one pound to 2000 lbs---and weighs it right.

To verify these statements:

Potato Leaf-Roll.

Last summer the plant pathologist of the Maine Agricultural Experiment Station found a field of potatoes badly attacked with blackleg where there was every evidence that the disease, along with the potatoes, had been imported from Scotland to Colorado a few years ago, taken from there to Idaho and then sent to Maine. In this case the Idaho grower had received a prize for raising 645 bushels of potatoes per acre. The name of this Scotch variety was new to the Maine purchaser, and he naturally thought that on account of the published yield that it was superior to those grown at home. Therefore, he paid a fancy price for enough of the Delmany Challange potatoes to plant several acres. This price was materially increased by the cost of freight nearly across the continent. When the field was seen in August, there was no evidence that the crop was materially better than that from home-grown varieties, but it did give an excellent illustration of how blackleg and other diseases may be introduced, particularly from Europe, with what are purchased for the highest grade of seed.

A new disease has made its appearance in some of the western states in 1911 and 1912 which is more serious than any yet experienced there. This is what is known as the leaf-roll disease and has been particularly severe in the irrigated regions of eastern Colorado and western Nebraska. The potato crop, which in these sections has been very profitable, has now been rendered so uncertain that the growers have been compelled to greatly curtail their average.

The leaf-roll disease is now thought to be a physiological trouble and not one caused by a living parasite. Some have suggested that it might be the result of unfavorable climatic or soil conditions, but as yet no one has been able to show under what conditions it is produced, or how it can be avoided. Hence, no remedy can be recommended. The important thing for the potato grower to know at present is that it is carried by the seed tubers. Moreover, potatoes from a field on which leaf-roll appeared will, if planted, produce a crop which is usually more badly affected than the first.

Leaf-roll has been known in Europe for some years and has been prevalent in certain sections since 1905. It has received much attention from some of the best German plant pathologists during the past seven years and there is coming about a feeling there that lack of care with regard to the quality of the seed stock used has much to do with the trouble. The same is true in all probability with regard to conditions in America.

When our potato growers will realize that careful selection of their own seed will improve their crops infinitely more than any "changing seed," and when they have reached the point where they will insist that no potatoes be planted on the farms whose source is unknown or which cannot be guaranteed by some responsible party as being free from disease, then we may expect to avoid most troubles of this kind. Of course, it will be wise to be on the lookout for new and improved varieties, but they should be bought under a guarantee of being free from disease and should be tested out first on a small scale before risking the infection of large fields with a new and dangerous disease. The common practice of selling off the entire crop and then picking up seed tubers from any available source and of any available grade, and the notion that seed must be "changed" frequently, is responsible for the present wide distribution of blackleg and scab within the state.

Plants attacked by the leaf-roll disease resemble in appearance those affected by blackleg and by the Fusarium wilt. The blackleg disease may be distinguished by the characteristic blackening of the base of the stem from a little above the soil downwards. With the Fusarium disease there is usually a distinct browning of the stem below ground and the tubers frequently show a discolored ring at the stem end.

The leaf-roll disease is characterized by a decided upward rolling of the leaves at the midrib. The foliage appears unhealthy, usually of a decided yellow, but often having a reddish or purplish tinge. While the growth of the affected plants is checked and the formation of tubers is prevented, they may live nearly as long as healthy ones. Plants attacked by blackleg, on the other hand, usually die before they have attained much size, and in ordinary seasons have entirely disappeared by the first or the middle of August in Maine. Plants affected by leaf-roll sometimes set small tubers clustered around the base of the stem, or numerous rudimentary ones are produced on the stolons. They also sometimes form aerial tubers in the leaf axils, but this may happen in the case of the blackleg or the Fusarium disease, or even mechanical injury of the stem at or near the surface of the soil.—Chas. D. Woods, Director Maine Experiment Station.

A Horse Forty-two Years Old.

Editor Maritime Farmer:—

Your readers will doubtless be interested in the account of an unusually long-lived horse, which belonged to Chester C. Culver of Albany Co., N. Y. I knew Mr. Culver well and there is no question as to the horse living to be past forty-two years of age at the time of death on Feb. 1.

This horse was born on the farm of Mr. Culver's father, July 4, 1870, and on the same day Mr. Culver was born. Boy and horse grew up together. When Chester was three years of age the elder Culver gave the horse to him and the ownership was continued until the death of the horse. Before young Culver was five years old he had learned to ride the horse, a very spirited and powerful animal. On July 4, 1876, centennial year, there was a great celebration in the village of Branchport and six-year-old Culver, on his "twin", headed the procession amid great applause.

One night, several years ago, Mr. Culver was awakened by a noise near the window of his sleeping room. He went out and found that the horse had been sticking his front feet against the house to attract attention. Mr. Culver went to the barn and found two tramps sleeping in the stall next to the one occupied by the horse.

Mr. Culver became much attached to the horse, which was always a fine roadster even up to his later days. Last spring he was a candidate for sheriff. The single vote against him was cast by a neighbor whom Mr. Culver went to see on foot. Every man whom he and the horse called upon in company voted for Mr. Culver.

This horse was forty-two years six months and two days old on the day of his death, was never sick and appeared as usual on the day before his death.

T. M. CHADWICK,
Yates Co., N. Y.

International Stock Food
Is Equally Good for Cows—Horses—Pigs

This great tonic is for all live stock—to make cows give more milk—to keep the working horses in prime condition—to fatten pigs and keep the "winter" pigs strong and vigorous.

We guarantee that it will make your colts, calves, pigs, shoats and lambs grow rapidly, and keep them healthy and thriving all the time.

Tell us the number of head of stock you own and we will send you a copy of our $3,000 Stock Book—Free.

Here's another farmer who finds it pays to feed International Stock Food:—

"Beukport, West Co., N.B., Jan. 13, 1913.

"INTERNATIONAL STOCK FOOD is all O.K. I average a package every two months for my stock—having three horses, four cows, two calves, four steers and sheep. Careful tests show that my milking cows have given 50 per cent. more milk since feeding International Stock Food. It is also fine for calves.

BEVERLY TOWER.

International Stock Food, Poultry Food, and Veterinary preparations are for sale by dealers everywhere. If you cannot obtain our goods in your town write us direct. (81)

EATON'S SPRING AND SUMMER CATALOGUE

NOW READY

SHALL WE SEND YOU ONE

NO one should miss having a copy of our latest issue. It's not only an interesting book to look through, but, over and above all, it's a book with a purpose. You'll find throughout its two-and-a-half hundred odd pages enough to convince the most sceptical of its saving opportunities. It's a style book—not too extreme in Fashion's trend, yet featuring what's newest and most serviceable, and, above all, conveniently priced—and what a profusion of home needs it portrays—furnishings from a door mat to a high-grade piano. A choosing of articles necessary for every room and clothing for all the family. Then there are also interesting values in modern **Farm Equipment, Farm Wagons, Cream Separators, Plows, Wire Fencing, Harness,** and lots more you might be glad to know about, such as **Athletic Goods, Boats and Canoes, Cameras, Drugs, Jewelry.** So you see that this big new book with its fund of buying opportunities has got something of interest for all, and every home has need of it. To those who have not received a copy we simply ask that they forward us their name and address—**at once**—even as you read this you should write for your copy, so that through no delay or forgetfulness any chance that is now apparent to save on the spending would be lost.

10.00 WE PREPAY CHARGES ON ALL ORDERS OF TEN DOLLARS AND OVER

Here's more **EATON** helpfulness that's bound to prove popular. What with **EATON** quality, quick service, and low prices always assured, and the added advantage of free delivery of all $10.00 orders and over, it would seem as if we had reached the high water mark of **EATON** service. Do not fail to read, first of all, the inside of front cover page of your Catalogue for fuller particulars regarding this important announcement and other details—and don't fail to use your Catalogue—make it your buyer, whereby every cent will have to go the farthest, and through which your best interests will be profitably cared for.

AN EATON PURCHASE MUST BE SATISFACTORY OR YOUR MONEY BACK AND WE PAY CHARGES BOTH WAYS

Chamberlain's Cough Remedy has won its great reputation and extensive sale by its remarkable cures of coughs, colds and croup. It can be depended upon. Try it. Sold by all dealers.

Cow Testing Associations.

(Continued from page 425)

ed and the percentage of butter-fat it is quite easy to find the number of pounds butter-fat produced by each cow and that is really the only fair standard by which we can judge our cows.

We have now reached the time of the year when the majority of the cows in New Brunswick freshen. Now is the time to begin keeping records and then persistent work is required that complete records may be obtained for the whole year or whole period of lactation. Incomplete records are very deceiving and practically useless.

It is hoped that much more interest will be taken in the work this year than ever before. This chance of obtaining a knowledge of the individual merits of their cows is the opportunity of the dairy farmers. They would certainly do well to give this matter serious consideration. It is one of those little details which go to make up success. Surely the results to be obtained will more than counterbalance the little trouble and expense involved.

Factory owners and managers would do well to give every encouragement to this work. These men will sometimes go far to increase their patronage. Would it not be well for them to help along the cow-testing work which, if carefully followed out by selection and breeding, will double the milk yield from the same number of cows in a few years.

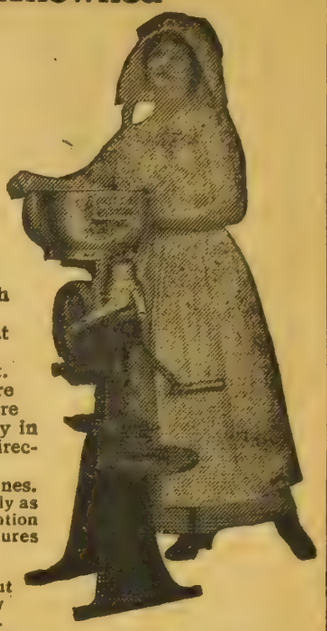
The cow-testing work is an effort to put farming on a business basis. Let all lend their co-operation to this work and when the business of dairy farming is carried on as a business great progress will be made.—H. N. Flewelling, Dairy Division Officer, Sussex.

MAKE MONEY

Selling World Renowned

EMPIRE

Cream Separators and STA-RITE Gasoline Engines



IF you want money—real money—you can make it selling EMPIRE Cream Separators and STA-RITE Engines. No others sell so easily, or give such good service.

Canada is speedily becoming a great dairy country.

Other things fail but dairying does not.

Prices of wheat and other products are uncertain but prices for dairy products are steadily rising. No wonder the tendency in the Dominion is more and more in the direction of Dairy farming.

Dairymen must have separators and engines.

No other separator runs so easily or quietly as the EMPIRE. No other needs so little attention or so few repairs. You know that these features appeal strongly to farmers.

We want energetic agents everywhere.

Write us for full particulars. Then get out your pencil and figure what you can easily make by taking the agency. Write us quickly. Agencies are going fast. Separators sell fastest and easiest in Spring and Summer, so ask for agency and Catalog 121 now.

The Empire Cream Separator Co., Ltd.
Toronto Winnipeg

Iced Cocoa—To every two cupfuls of cocoa made in the usual manner add half a cupful of whipped cream. Beat it into the cocoa sweetened to taste, and let it stand until cold, in glasses, with ice.

It's a wrong idea that "only the rich can afford to run a dairy by modern, scientific methods." The rich are the only ones who can afford to run it any other way.

MOLASCUIT MEAL

The Pure Product of the Sugar Cane and contains no Foreign Substance.

A Highly Nutritious Food

Used by the Largest Farmers and stock keepers in the British Dominions with great success.

Feed it to your Horses, Cattle and all Live Stock

It is the most economical of the Molasses Feedstuffs, and a very small quantity per day will keep all your animals in good condition. You will find it worth your while to give it a trial.

It is entirely British grown and British manufactured, being made in Demerara entirely from the Sugar Cane grown in that Colony.

One Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The adress must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small add as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, St. John, N. B.

GEO. H. SEAMAN, Moncton, N. B.

"Women of Canada, I want You to House Your Family under A Perfect Fireproof Roof and within Fireproof Walls. See that Your Husband Gets My Book"

G. A. Pedlar

"I KNOW, when I talk to the women of Canada about making their homes safer against fire, and better as dwelling places, that these women will listen to me. And they will listen to me and act as well, when they learn that Pedlar products are moderate in cost, compared with the service they give and the labor and work they save."

"I have been in business a long, long time now. It has been one of my rules since the beginning to give the very best and most honest value in everything I make and sell. My line of goods has expanded in every direction."

"One of these is my metal lath. Use it in your homes when you are building with cement plaster. This makes each wall a fire barrier, and makes each ceiling a fire barrier, too. It is much safer than wood lath and lime plaster."

"But, if your house is already built, and especially if you live in a wooden house, either use my metal lath with cement stucco on the outside walls or use my metal siding in various patterns. This makes your house 'fire-retardant.' It cannot catch fire from sparks."

"In the same way, use my beautiful 'Oshawa' or 'George' Metal Shingle or my metal tile on your roof, instead of cedar shingle. It makes a clean, smooth roof."

"Talk to your husband about these things. I will be glad to answer any letters you send, but I would prefer that you write my nearest branch. Suppose you plan to fire-proof your home. Write, and tell about your house and its size and building material."

G. A. Pedlar

"Here is My New 'George' Shingle for Barns"

"I AM very proud of this 'George' Shingle. It is, like my 'Oshawa' Shingle, now sold all over the world, but is much bigger. My son, the late Geo. H. Pedlar, Jr., planned it to save labor time in laying roofs, for he foresaw how labor prices were going upward. They did rise, and the price of cedar shingles also. The result is that, to-day, this metal 'George' Shingle makes a less costly but far better barn roof than cedar. See your husband uses it. It fireproofs his barn roof."

"Save Barn Cost, and Fireproof It with My Galvanized Corrugated Iron"

"My Pedlar Galvanized Corrugated Iron saves the cost of barn walls, compared with wood. It makes a warmer, stronger barn, lightning-proof as well, and needs no paint like wood. It saves so much in high-priced labor during building that it pays to use it, without considering how much better it builds a barn."

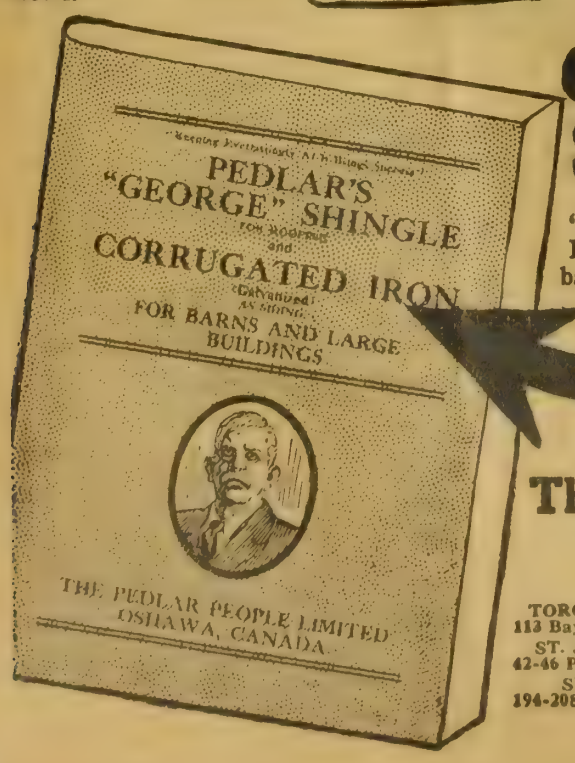
"My Art Sidewalls and Ceilings Make Your Home Fire-proof"

"I spoke of using my metal lath and cement plaster to make a new house fire-retardant. For an old house, I have beautiful patterns in sheet metal sidewalls. Put these on wall and ceiling, right over the plaster. This little picture shows how such a wall looks. Get my catalogue 17CC for details."

"I make my Metal Art Sidewalls and Ceilings in various architectural styles. Remember you can get them for your school, church, local hall, etc., where there is fire danger."

"Put My Metal Sidewalls on Your House to Stop Fire Danger"

"This shows my Pedlar Siding to go outside the weatherboarding on your house. It is metal, in patterns for stone, brick, etc. Paint it or leave it in the gray zinc color. It costs little and stops fire danger. Anybody can apply it. Ask for my catalogue on "Siding."



Get My 'George' Shingle Book

"This is a book for your husband. It tells how he can build his barn with Pedlar metal walls and roof, instead of burnable wood. Have him write, or write yourself. I will send it free."

"Get My 'Fireproof' Book for Your House"

For making your home fireproof with my shingle, metal tile, metal lath, metal siding, and my other metal specialties, write the nearest branch, and say that you want them to send you my "Fire-proof" Catalogue No.

Have Frost & Wood help in your hayfield

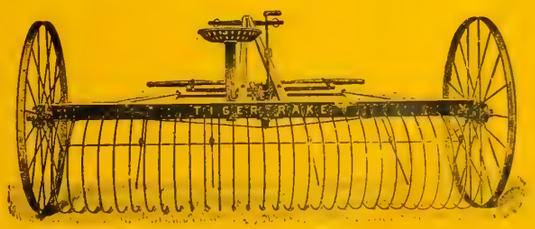
THERE is an experience of 75 years behind "Frost & Wood" farm implements. This means that few farm machines have the benefit of so many suggested improvements by so many practical farmers.

When you buy a "Frost & Wood" machine or implement, the purchase you receive has in it details, materials and features of design that make it as nearly perfect in service and dependability as skill can make it. You cannot be in error, if your implement bears the name "Frost & Wood."

Frost & Wood Mowers

The long pitman on this Mower avoids broken knives and wear at the knife head. The drive from the main wheel is by means of an ***Inside*** gear operating an ***Inside*** pinion. This keeps two gear teeth in contact with two pinion teeth. and reduces wear. These close-meshed teeth start the knife immediately, and prevent choking at the cutter bar, broken knives and sections, and strain on the Mower and team.

"Frost & Wood" Mowers have roller bearings on the power shafting, are easily oiled, and give years of service like a new Mower on account of the care taken in building each part.



Frost & Wood Tiger Rake

We have put a "perfect" Rake on the market—the "Tiger." In the first place, it is strong and simple. We support the frame with a truss on the larger sizes, and make this rod of heavy steel. The teeth are perfectly seated in the tooth bar, and are of the best steel. They are tempered in oil and are so carefully shaped that they slip along the ground, missing nothing, but still not digging into the sod.

The foot-trip is an easy-working cog device, operating at the centre of the axle where the weight of the load is most nearly even. Everything is the best material obtainable, and the "Tiger" will give long service and fullest satisfaction. See the catalogue.

Write us for Catalogue or see the Frost & Wood Agent about any Farm Implement you need, especially if you seek years of perfect service in your machinery.

The Sussex Manufacturing Company's Line Is Complete

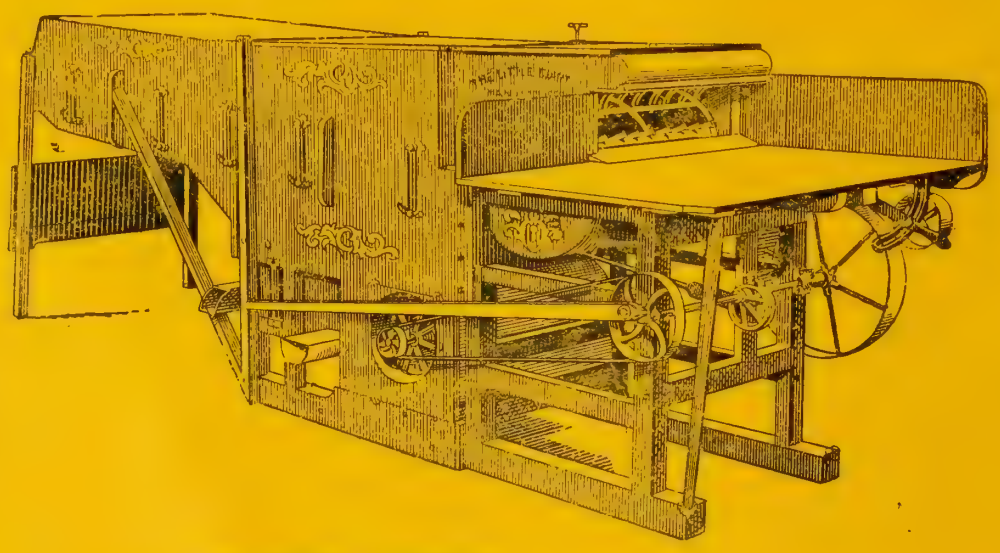
THE Sussex Manufacturing Company line is the best in their class on the market to-day. You will see by the cuts and the catalogue which we would like to send you that we have made many valuable and extensive improvements and have added to our lines a number of new machines which have been designed by expert mechanics.

In the construction of our machines we have availed ourselves of the services of highly practical men of long standing thus enabling us to offer to the public goods which are unsurpassed both for quality and service.

As an evidence of this large number of strong testimonials, which we will furnish upon request, have been received from satisfied customers.

Also being closely connected with one of the leading lumber concerns in Eastern Canada, we are in a position to get the very best lumber some years in advance of the time when it is required to be used; thus giving us an opportunity of thoroughly seasoning the wood by the air dried process and it is found that our machinery which is so constructed gives splendid satisfaction and is better able to stand the climatic changes to which it is subjected in actual use.

One of the strong features is, that every machine we build is set up and given a thorough test before it leaves our factory.



Two Horse Thresher

This is the machine on which our reputation has been built and is without doubt the best machine on the market.

Can be operated with Two Horse Tread Power or with Gasoline Engine. It is decidely in favor where limited quantities of grain are to be threshed.

Four Horse Thresher

Built especially for use with Gasoline Engines.

Experience has shown that Gasoline Engines are coming more and more into use as a power for threshing purposes.

With this power, the demand is for a machine small enough to be moved from place to place with ease and yet of sufficient capacity to turn out a big days work.

Our Four Horse Machine is especially built to meet this demand. A five to seven horse power engine will operate it with ease. Can be supplied with or without tailings elevator, bagger and also with trucks if so desired.

New Model Undershot

The Undershot Thresher is designed to meet the requirements of those who need a heavier and faster threshing machine then our Four Horse.

It is made very strong throughout. The frame is of the best straight lumber, well joined and thoroughly braced, so that when the machine is running at its full capacity there is very little vibration. The grain can be taken from either side of the machine and change can be made while in operation.

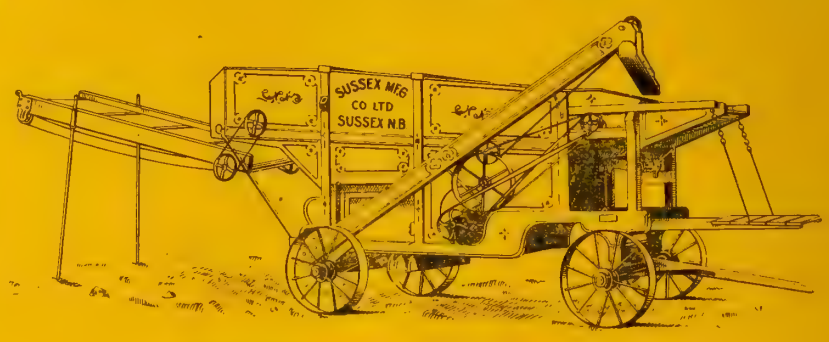
It is fitted with trucks, tailings elevator and one length of straw carrier. A bagging attachment is supplied at a slight additional cost and can be used on either side, to which bag can easily be attached, provision being made for two bags

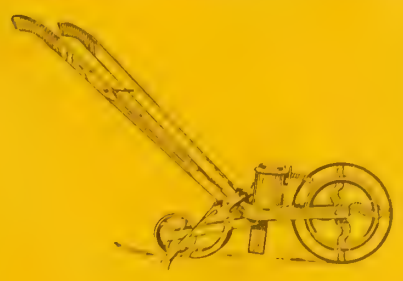
The New Model Undershot Thresher is operated with an eight to ten horse power engine. The main bearings are all equipped with compression grease cups. A convenient tool box is placed underneath the cylinder, thus keeping the tools that you need near at hand.

Inside of a New Model Undershot

The body is 40 inches wide. The separating device consists of a number of kickers which thoroughly agitate the straw and take it direct from the cylinder.

For the perfect separation of grain, this machine has no superior.





Garden Seeder

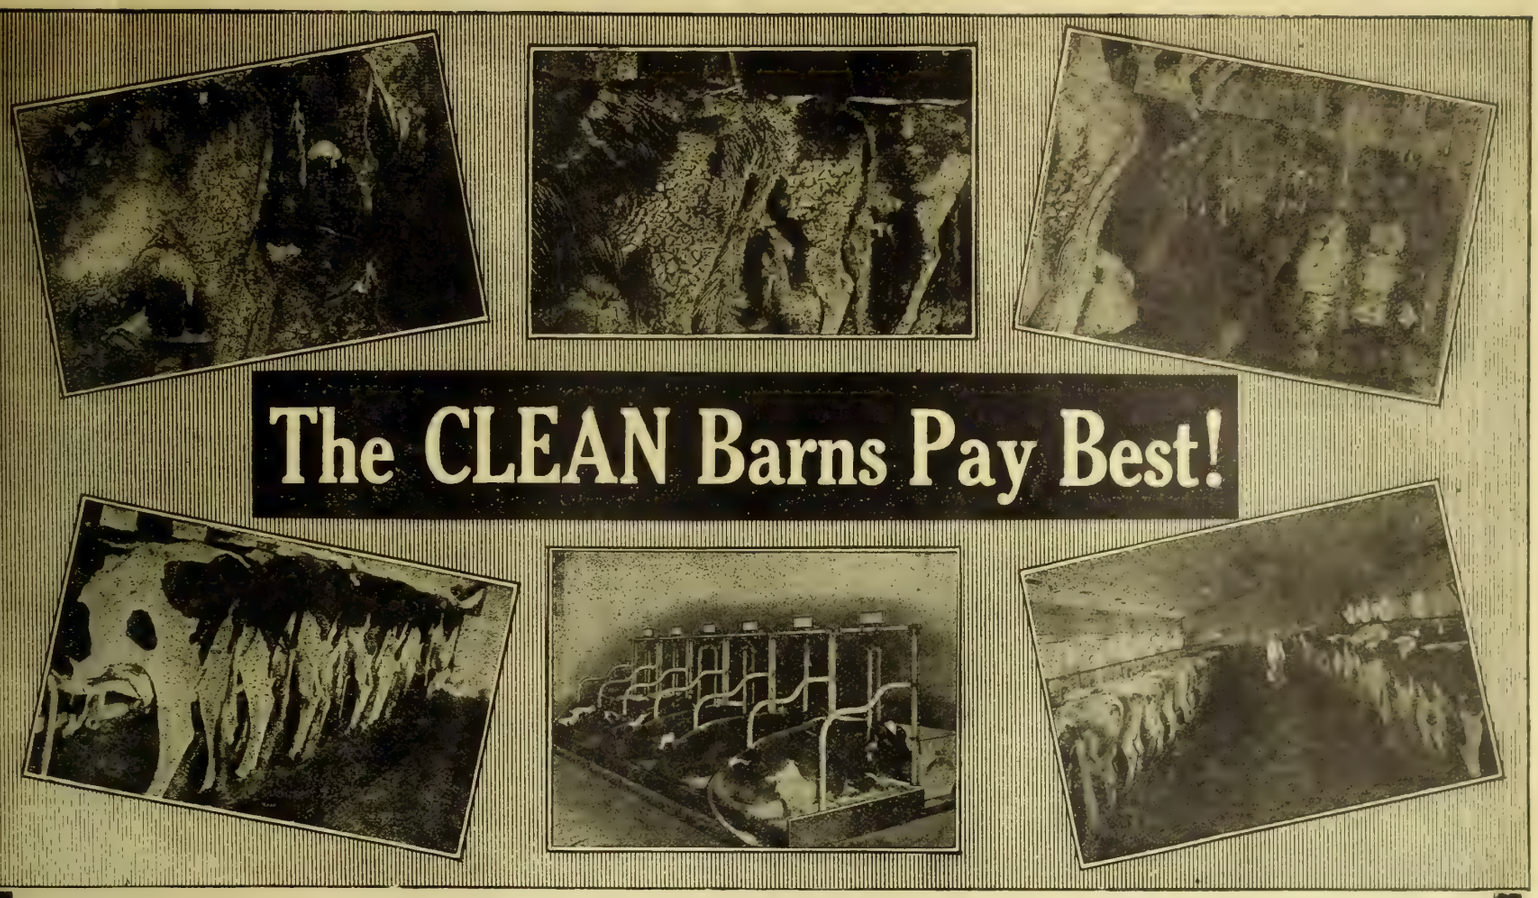
In selecting a Garden Seeder the best obtainable is the one you should have. Our seeder has years of success behind it and with improvements recently added, makes it without doubt the best machine of the kind on the market. The seed discharge of this machine can be exactly regulated by moving the steel plate at the base of the seed cup as per directions on the side of each seed cup.

The flow of seed can be instantly stopped by a swinging cut off operated by a chain attached to one of the handles. This prevents any loss of seed at the end of the row. The marker is held firmly in place and is easily adjusted. The covering wheel is attached to a swinging frame and by varying pressure on the handles, the operator can roll lightly or otherwise. The main wheel is high with a wide rim, keeping it from sinking into the soft earth. No better seeder can be built for the accurate and fast sowing of turnip, cabbage, sage, carrot onion, parsnip, spinach, beet, pea, corn and all other kinds of garden seeds.

Manufacturers of Threshing Machines in four sizes; Horse Powers in two sizes; Hay Presses, Wood Cutters, in three different sizes; Grain Grinders, Root Pulpers, Garden Seeders, Feed Boilers. A large and well assorted stock of Plow Castings, a large and complete line of House Finish, Refrigerators, School and Church Furniture and General Workers in Wood and Iron.

The Sussex Manufacturing Company

SUSSEX, N. B.



The CLEAN Barns Pay Best!

Modern Barns Are Easy to Clean—Easy to Keep Clean

If you could line up every cow so the manure would all drop into the gutter, ***none*** of it on the bedding in the stall—if you could ***remove*** the manure from your barn in half the iime, with half the work—wouldn't it be worth ***real money*** to you?

If you could feed your cows individually—giving each one her share—making it impossible for one to rob from another—if you could water them in the stall, all at the same time—if you could prevent cows from nosing their feed into the stalls—if you could make ***play*** out of getting the manure into the spreader, wagon or shed, or on the pile 30 to 40 feet away from the barn—wouldn't those advantages mean ***dollars*** and ***cent*** to you?

And if you found that the equipment necessary to make all these things *real* in ***your*** dairy, would pay for itself the ***first*** year and would last a ***lifetime***—would you be interested enough to investigate more thoroughly?

You will answer "yes"—if you are in the dairy business for ***profit***. That is why we want you to mail the coupon to-day, for our two fine free books which fully describe and illustrate the many advantages of

The BT Sanitary Barn Equipment

Stalls, Stanchions, Pens, Litter Carriers, Feed Carriers, etc.

There are five patented features of the BT Stalls and Stanchions that make them five times better than any other. Our Stall Book tells about them. The Alignment Device, Sure Stop Swinging Post, Double Curve Partition, Individual Self-Cleaning Mangers, Stanchion Rests. These are the features that make the BT Stalls and Stanchions the choice of dairymen who want the greatest efficiency in their barns.

The BT Manure Carrier has twelve or more advantages over any other, advantages that you cannot afford to overlook when deciding on the carrier to buy. The easy bent I-Beam Track requires no special curves. The adjustable button-on hangers, the movable track section, simple switches, double windlass chain, solid steel windlass shaft, clean, easy hand-wheel windlass, friction brake, latch trip, etc., heavy galvanized tub—think of all the features possessed by the BT Carrier, and every one a work-saver, time-saver and money-maker. Isn't it worth while to investigate the BT Equipment?

Barn-Building Book Free

For years we have had a special study of dairy barns—not only how they should be equipped, but how they should be constructed, lighted and drained how they should be designed and arranged to be most profitable to the owners.

Some of this knowledge is incorporated in our book, "How to Build a Dairy Barn." This book contains information that every farmer should know regarding sanitary housing of dairy cows. It describes lighting, ventilation, stable floor construction, and contains suggestions about silos, site, appearance, exposure, design, drainage and equipment, illustrated by many blue prints.

We will send a copy of this book free—providing you answer the questions in the coupon.

If you intend building or remodelling, write us for full information in regard to our Free Barn Planning Service.

Send in Your Name

We want you to write to us for our book; even if you only intend making a few changes or additions in your stable. We believe you will find many paragraphs of interest. the fine illustrations of modern barns—inside and outside views, the letters from owners of BT equipment, facts and figures. Simply fill in the coupon and the books you request will be mailed to you free at once.

Stall Books tells all about BT Stalls and Stanchions, Calf Pens, Cow Pens, Box Stalls, etc. Carrier Book about BT Litter Carriers, Feed Carriers, Milk Can Conveyors and Feed Trucks. Fill in the coupon and mail it.

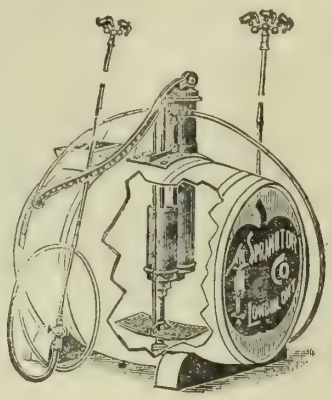
HAND SPRAMOTOR

A Machine that will Return the Money Invested in it Every Year and Then Some

A Hand Power Spramotor sprays an acre of potatoes ***effectively*** in 30 minutes—***annihilates*** bugs, germs and pests and makes the blight impossible—making your work ***vastly more profitable*** than ever before.

The Hand Spramotor has two lines of 10 feet hose—cuplings attached, patent valves, two bamboo extension rods with internal brass tube brass cupped ends, patent drip guard and two nozzle clusters.

A ***durable*** machine for all purposes — destroying weeds, spraying orchards and can be used effectively for white-washing or painting the buildings about the farm.



Note — There's a Spramotor ***built for your exact*** requirements. Prices range from $6.00 to $350.00. You owe it to yourself to find out all there is to know about it. We forward you the facts with our treatise on "Crop Diseases" without placing you under any obligation to buy.

SPRAMOTOR CO.,

1534 King Street E. - - LONDON, Can.

OUR VALUES

are summed up briefly under the following captions:

Style and Quality

Our goods are made to suit you no matter what your occupation may be or what they are needed for.

We are shoemakers of many years experience and understand the needs of this country.

Make Your Coal Oil Lamp Burn Gas

The New "Great White Light" Burner Turns Ordinary Kerosene Illumination Into

GASLIGHT

"ASK THE USER"

"Great White Light" Burners speak for themselves, prove their worth, make friends—
IF
GIVEN
A
FAIR
TRIAL

EVERY "Great White Light" burner sold under a POSITIVE PROTECTIVE GUARANTEE not to smoke nor smell even when turned low or burned all night.

WHAT THE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil.

THE PROBLEM OF PERFECT COMBUTION

Air is composed of 79% Nitrogen and 21% Oxygen. The Nitrogen is entirely useless for combustion or light giving purposes, but it must go through the burner in order to utilize the oxygen. How to overcome this useless 79% of Nitrogen that **must pass** through the burner and how to **increase** the supply of Oxygen which in turn will increase the quality and size of the flame has always been the problem. The popular idea has been for some time that heat is the only medium which will accomplish this process of separation, but it has since been learned through exhaustive and comparative tests that heat plays only a small part in the operation.

WHAT TE WONDERFUL BURNER DOES

Located on both sides and in the interior of the dome of the "Great White Light" burner are the marvelous little "Radions" which are placed securely and with such absolute precision that they generate the latent gas properties in kerosene oil. The discovery of the scientific action obtained by the use of the "Radions" has opened new and unlimited opportunities for coal oil illumination.

Air will not mix with oil itself, although both are essential for **perfect** combustion and this is where the wonderful action of the "Radions" is manifest and as they gradually become heated the process of separation takes place. The "Radions" help to draw the supply of Oxygen from the flat sides of wick and force it toward the ends of the tube where it is most needed, at the same time repelling or forcing away the useless Nitrogen and creating a tremendous draught through the burner and chimney, which in turn supplies the necessary increased amount of Oxygen to form an **absolute, complete and perfect combustion.**

SIMPLICITY

Although the principle of the burner is built upon highly scientific lines and the results it produces are marvelous, still it is extremely simple in construction and any child can handle the burner with utmost safety. **UNDERSTAND THE POINT**—it makes no difference what you have ever seen, or heard of, or used as a coal oil burner the new **"GREAT WHITE LIGHT"** is entirely different, cheaper and better.

One of these burners, either small, medium or large size, will be sent to anyone, whether new or renewal subscription. When sending in money state which size you want. Send to-day.

We guarantee these burners to do as represented or money refunded.

The Maritime Farmer

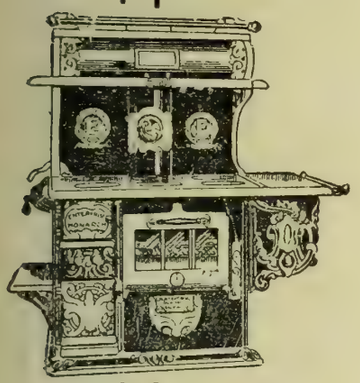
SUSSEX, N. B.

We do not sell these burners but each subscriber may get two beside one we furnish free by sending 35 cents for each additional one wanted.

Agriculture The True Basis of A Nation's Wealth

In other words, the Farmer is the backbone of the country. **BUT,** back of the Farmer is his Wife, the true source of his individual wealth.

If the wife is not a good cook and housekeeper, she can waste more in a week than the farmer can save in a month: **BUT** no housekeeper, however expert, can do good work with a poor stove, and unlike her city cousin, the farmer's wife cannot send to the corner store for cakes, pies and ready-made dainties if the stove "won't work." She must rely on her own kitchen equipment for all the cooked foods needed in the farm home. This is where the—



ENTERPRISE MONARCH STEEL RANGE

comes in, as an economical and reliable baker. With its large extension fire box for wood burning, heavy castings, large copper reservoir giving an ample supply of hot water, and every known device for accurate baking the **MONARCH** is just the range for the farm home.

EASY TO OPERATE **HARD TO WEAR OUT**

EASY ON FUEL **HARD TO EXCEL**

The price is low, being no more than many inferior ranges are sold for and we furnish a **written guarantee with every Monarch sold.**

Drop us a card for circular illustrating and describing its many special features.

DE LAVAL
CREAM SEPARATORS

Cheapest As Well As Best

Every sensible person wants the **best** of everything, but in many things the best is beyond their means and they must necessarily be content with something less.

In the case of the Cream Separator, however, the **best** is fortunately the **cheapest** as well, and it is of the greatest importance that every buyer of a separator should know this.

Moreover, the **best** is of more importance in the case of the Cream Separator than in anything else, since it means a saving or a waste **twice a day every day in the year** for many years.

It is true that DE LAVAL Separators cost a little more in first price than some inferior separators, but that counts for nothing against the fact that they **save their cost every year over any other separator,** while they last an average twenty years as compared with an average two years in the case of other separators.

And if first cost is a serious consideration a DE LAVAL machine may be bought on such liberal terms that it will actually **save and pay for itself.**

These are all-important facts which every buyer of a Cream Separator should understand and which every local DE LAVAL agent is glad to explain and demonstrate to the satisfaction of the intending buyer.

If you don't know the nearest DE LAVAL agent simply address the nearest of our main offices as below.

Wood or Concrete Silos, which are best?

Over in the U. S. many experiments made by the various agricultural experiment stations have conclusively shown that **silage does not keep as well in cement, stone or brick silos as in silos constructed of wood.**

Furthermore, the advantage of the wood silo over cement, stone or brick is greatest in a cold climate.

The vital question is "Which silo will keep the silage in the best condition"

If you are interested in reading the unbiased opinion of scientific investigators who have given this question careful investigation we shall be glad to send you, upon request, reprints of some of the experiment station bulletins giving in detail the reasons why wood silos make the best silage and keep it in the best condition.

We shall also be pleased to send you our silo catalog and give you any other silo information desired.

We are exclusive distributors in Canada of the World's Standard De Laval Cream Separators, and also carry a complete line of creamery and dairy machinery and supplies. If interested write for separate catalogs.

Canada's Leading Stock Men Strongly Recommend The Use Of

Dr. WILSON'S DERBY CONDITION POWDERS

for Horses, Cattle, Sheep and Pigs

The names of the successful Stock Breeders whose testimonials appear in this advertisement, are household words in the Maritime Provinces. They are some of the leaders who are setting the ideal to which progressive fellow farmers aspire. They are authorities on the care and management of Live Stock.

Read what they say about Dr. Wilson's Derby Condition Powders, the best Live stock conditioner on the market as it purifies the blood and improves the general appearance of every animal to which it is administered.

Demonstration Orchard Work in New Brunswick

THE three demonstration orchards taken over by the Department of Agriculture last year in Sunbury, York and Albert Counties, were conducted again this year under my direction together with the orchard of C. R. McKenzie, at Lingley, Kings County. These orchards are serving their purpose of affording a good demonstration not only of the renovation of neglected trees, but of the advantages resulting from proper pruning, spraying, cultivation and fertilizing. The returns from there orchards for the present year, with the exception of the one at Lingley, show very satisfactoev profits and the trees without exception have responded well to the treatment. Full particulars as to the care and treatment of these orchards, together with the results of last vear's work will be found in the Report of Horticulture for 1911.

SUMMARY

ALBERT COUNTY ORCHARD

Net profit per acre in 1911..... ....$181 70
Net profit per acre in 1912..... .... 79 49

Average annual profit per acre for two years $130.58, which on a valuation of $500 per acre is a return of 26 per cent.

SUNBURY COUNTY ORCHARD

Net profit per acre in 1911..... ....$ 55 89
Net profit per acre in 1912..... .... 206 91

Average annual profit per acre for two years is $131.40, which on a valuation of $400 per acre is a return of almost 33 per cent.

YORK COUNTY ORCHARD

Net profit per acre in 1911..... ....$ 88 56
Net profit per acre in 1912..... .... 341 74

Average annual profit per acre for two years is $215.15, which on a valuation of $300 per acre is a return of over 72 per cent.

THE ALBERT COUNTY ORCHARD.

This orchard is situated at Lower Coverdale, on the Petitcodiac River, six miles below Moncton. The soil is a stony loam with a gravelly subsoil. The site has a northeastern exposure to the river and is well windbreaked with spruce. There are about 625 bearing trees about thirty-five years old. 21 by 26 feet apart, mostly of the Winter Bough variety.

Eight rows were taken over by the Department in the spring of 1911, in which were the following trees; 65 Winter Bough, 44 Alexander, 39 Bishop Pippin, 26 Red Streak, 17 Ribston Pippin, 7 Manx Codling, 5 Belliveau, 2 Northern Spy, 1 Greening, 1 Fameuse, 1 Gravenstein and nine others, various varieties, names not known. The Winter Bough, Red Streak, and Manx Codling were about all large trees, but many of the Alexander were badly cut up and had had their bearing surface much reduced through black rot canker on the limbs. The other trees were of medium size. The many numerous large canker and other wounds, together with the somewhat neglected state of the orchard, made the scraping, painting and general spring work very expensive in 1911, but the expense of such work was considerably reduced in 1912.

EXPENDITURE OF SPRING OPERATIONS.

Pruning 2¾ days at $2.00	$ 5.00
10 bbls. Winter Spray at $1.54	15.40
14 bbls. Summer Spray at $1.12	16.68
Hauling Brush. 2 men and 1 Horse, ½ day	2.25
Plowing, 1½ days at $3.50	5.25
Harrowing, 1 day at $3.50	3.50
36 two-horse loads of manure applied in 1911. $54. half chargeable to 1912	27.00
1000 lbs. Basic Slag and 900 lbs. Sulphate of Potash, applied in 1911, $33.45, half chargeable to 1912	17.73
Hauling fertilizer to orchard in 1911, $3.00, half cost charged to 1912	1.50
Cover Crop Seed	8.25
Sowing Seed	.75
Depreciation of Spray Pump	5.00
Total	$108.31

EXPENDITURE OF HARVESTING AND MARKETING.

280 bbls. delivered at .30	$84.00
Picking and packing 280 bbls at 25c	70.00
Hauling to Moncton 280 bbls. at 10	28.00
Market Fees, 280 bbls. at .05	14.60
10 p. c. Sales Commission on $703.70	70.37
	$266.97
Interest at 6 p. c. on $1,500.00 value placed on 3 acres of orchard by Mr. Steeves	90.00
Spring Expenditure	108.31
Total expenditure	$465.28

REVENUE.

16 bbls. No. 1 Winter Bough at $2.25	$36.00
4 bbls. No. 2 Winter Bough at $1.50	6.00
20 bbls. No. 1 Red Streak at $1.60	32.00
12 bbls. No. 1 Manx Codling at $2.10	25.20
3 bbls. No. 2 Manx Codling at $1.50	4.50
45 bbls. No. 1 Alexander at $2.25	101.25
20 bbls. No. 2 Alexander at $1.75	35.00
25 bbls. No. 1 Ribston at $3.50	87.50
10 bbls No. 2 Ribston at $2.25	22.50
80 bbls. No. 1 Bishop Pippin at $3.25	260.00
40 bbls. No. 2 Bishop Pippin at $2.00	80.00
2 bbls. No. 1 Belliveau at $2.00	4.00
3 bbls. No. 1 Fameuse at $3.25	9.75
Total Revenue	$703.70
Total expenditure	465.28
Net profit from 3 acres	$238.42

Net profit per acre $79.47, which on the valuation of $500 per acre is a return of almost 16 per cent.

The balance of the orchard, which under Mr. Steeves' own direction was partially pruned and sprayed in 1911, but not cultivated or fertilized, was

LET US SPRAY---Three Great Essentials

Proper Material Systematically Applied at the Right Time

By M. K. Ells, Secretary N. S. F. G. A., Port Williams, N. S.

IT IS safe to say that interest in spraying was never so keen among fruit growers as it is this spring. At last it has become a live question and, 1912 with its thousands of barrels of spotted, wasted fruit, may be looked on in after years as giving us the most valuable lesson in our history.

Experience is a hard school master, and his educational fees are enormous. Some fruit growers last year with two or three thousand barrels of apples, paid their whole crop to find out what was made know twenty years ago by government experts who addressed agricultural meetings in the Valley at that time. In looking over some Reports of the Nova Scotia Fruit Growers' Association, I find that in 1893, Prof. John Craig speaking at Wolfville, gave an address on the "Black Spot." This address is so pertimate at the present time that I will copy part of it verbatim. He says:

"Now although we talk a great deal about the disease commonly called "Black Spot," I do not think any of us realize the vast amount of damage which is justly chargeable to it.

During the year 1890 the estimated injury resulting from "Black Spot" in the United States, and as close an estimate as possible was formed, amounted to sixteen million dollars to the apple industry alone and from this estimate we can very relatively judge what is our own relative position in regard to it.

In considering this disease there are a few foundation principles which we should take up first, and study, before we can get a clear understanding of the methods and reasons for treating it in certain ways.

In a broad way it is well to consider what most of you know, that fungi belongs to a flowerless class of plants and exist on dead or living plants—they are unable to take up the crude material from the soil as flowering plants do, but they maintain their existence by living on other plants which prepare food for them and give it to them in an assimilated form. They have no flowers or seeds, but their reproduction is effected by special organs which are called spores. There are two classes, one feeding on dead organic matter; the other on living plants. These latter twine around and take hold of the plant and draw the nourishment out of it—and this class which derive their nourishment from living plants are called Parasites. Smuts, Mildews and Rusts belong to the parasitic class, so that we see they have no power of assimilating food for themselves. It must be prepared and in an assimilated form. Another great difference between them and our ordinary plants is that they have no visible flowers—they are entirely flowerless. Their negative portion, or that which corresponds in flowering plants to leaves and buds, consists of slender thread-like tubes, collectively called mycelium.

These portions which correspond to seeds of the flowering plants are called spores. These spores are exceedingly minute and multiply with great rapidity, and by means of these the disease is carried over from one season to another. The parts of a fungus are microscopic objects not discernable by the naked eye, and can only be distinguished by means of a high power microscope. The number of injurious fungi probably surpasses that of the flowering plants.

We, of course, are all familiar with the well-known "Black Spot" of the apple, also the disease which causes the blighting of the pear and apple.

An Orchard Syraying Meeting Held at Chipmans Corner Kings Co., N. S., 1912

A Portion of R. S. Starr's Orchards, Starr's Point, N. S.

A familiar example is also found in the disease which causes the potato rot. These are all specific microscopic plants, and depend upon spores or seeds for reproduction in the same manner as flowering plants. Now, of course, one plant living upon another—storing up nourishment which is filched by the other must be injured to a serious extent.

There are several ways in which these parasites are injurious. They first deprive the host plant of its nourishment, and its food supply being weakened and reduced, its vitality is naturally lowered, and it is unable to properly perform its functions, it does not ripen up the wood made during the season, and it is unable to perfect its fruit; again, the growth of this unnatural state of affairs may be accelerated or retarded in an abnormal manner, and the general health of the tree much affected. In connection with "Black Spot" one of the principal features we observe at the North is that the plant is so much weakened that the growth of the season is not well ripened and the plants go into winter in bad condition and are injured by the cold, even although we may not have noticed the presence of the fungus on the foliage. We thus find that owing to the attack of the parasite that the tree does not ripen up its wood in the autumn, if then a severe winter follows we have what is commonly called winter killing, caused as I have said by insufficient nutrition due to supporting parasites. Among other effects noticeable in summer when the attack is severe are that the leaves and fruit fall and decay prematurely.

The disease to which I wish to direct your attention more particularly at this time is the "Apple Scab." I find some of the results of experiments which I have carried out in the treatment of this disease have already been incorporated in your report of last year and those who have read it will be able to listen to the present imperfect explanations at least with some degree of satisfaction. The Apple Spot is a product of the cool climates although it extends its attacks from Maine to California. It does not exist to any injurious extent in the extreme South. It depends more or less upon climatic conditions for a greater or less development—a cool and moist atmosphere being particularly favorable to the germination of the spores and spread of the malady, while a dry, hot condition has the opposite effect. At first it was not understoad that the disease attacks both the leaves and the fruit. The pressure of the enemy is first brought to our notice by small black spots on the fruit, which are now looked upon as only one form of the trouble. When investigators began to examine it closely they found another form on the leaves, causing peculiar blotches or smoky colored spots—this was proved to be the same thing. It thus occurs that sometimes we may find the fungus affecting the leaf very badly, and on the same tree the fruit might be comparatively free, and right here is a point of considerable importance; in such cases, when the fruit is not affected much, fruit growers frequently do not think it necessary to spray their orchards, but it is important to treat the tree whether the fruit is attacked or not. I have already shown that the growth is greatly retarded and the health of the tree much impaired by the fungus growing on the leaves. The spores or reproductive organs are carried over winter by living on fruit in the barrels, also on dead leaves, and so we have many ways and means for it to be carried through from one season to another. Now, you will then see the ill effect of putting in barrels fruit which is affected with the scab, as the closed and damp atmosphere of the barrel will certainly favor the growth of the fungus."

He then went on to describe how to make and apply Bordeaux mixture and the results that could be expected, closing his address with these remarks: "The main points to be remembered in connection with this malady are that it is caused by a minute parasitic fungus, a low form of plant life, which, by living on the leaves and fruit of the apple, prevents assimilation in the former, and the development of the latter. It is not so generally known that the same fungus attacks both the leaves and the fruit. A few facts to be remembered in connection with successful treatment are: 1. That it is perpetuated by spores that take the place of seeds. 2. That these spores formed in the autumn, live over winter upon the dead leaves. 3. That these germinate in the spring as soon as conditions are favorable, which is usually about the time the young foliage developing. The efficacy of the copper salt remedies have now come to be generally recognized and the fruit grower who does not use these remedies is neglecting a simple precaution in direct opposition to his best interests."

Although twenty years have passed since that address was given, very little could be added at this date that would increase our knowledge on the question, except that we now have lime-sulphur and power sprayers with which to apply it in thorough manner; and yet it has taken twenty years to assimilate the knowledge given us by Prof. Craig and many others since that time of what caused Black Spot and how it could be controlled.

In this enlightened age there should be no mystery about a subject discussed so often and for so many years in the agricultural press and on the platform by institute speakers and wher-

ever fruit growers meet, from the blacksmith shop to the prayer meeting. Everyone understands what a potato bug is, and no questions but what Paris Green will kill him if it is applied where he will eat it. We can see all this with the naked eye, and "seeing is believing." Because we cannot see the spores of the "Black Spot" is no reason why we should not believe that it exists and is capable of doing quite as much damage in its line as a potato bug, and also that there are poisons that will control it the same as Paris green will control the potato bug: and to follow out the illustration, just as there is a certain time when the poison must be applied if we wish to protect our potatoes, so there is a right time that we must spray to kill the spore of the Black Spot or our work is labor in vain. This question of time does not seem to be generally understood. To raise a crop of clean apples in a year like 1912 is no hit or miss affair, it means careful planning and then sticking right to it through the season. Here knowledge is strength, for a man who does not know what he is fighting, or understand how it developes is in a hopeless position. If he succeeds, it will be by chance not by knowledge.

In writing for this magazine last August I said there were three essentials if we would be sure of clean fruit, I want to emphasize them here. They are a correct spraying mixture, applied at the right time and in the proper manner. It is useless to look for success if any of these three are neglected. Either lime-sulphur or Bordeaux will fill the bill, and can be prepared with very little trouble. With commercial lime-sulphur everything is done for us except putting it in the spray tank and when the other two essentials are carried out it has given splendid satisfaction.

The correct time to apply seems to bother a good many people; the books say to spray just before the blossoms open, immediately after the petals have fallen and again ten days or two weeks after that. This looks simple enough on paper but in practice how many fall down?

The first spraying is frequently missed altogether or a bright day opens the blossoms quickly before the work is completed. Rain may cause the loss of two or three days just as the trees go out of bloom and by the time the pump is well started the little apples are as large as the end of your finger.

Still others spray at no definite time, but put it on whenever they can make it fit in with other farm work. The third spraying is a sort of retoucher to catch any places we may have missed the second time, and also to protect the new surfaces exposed by the rapidly growing leaves and fruit.

We have the evidence of dozens of practical men in the Annapolis Valley that these three sprayings with either Bordeaux or lime-sulphur and applied as they should be will insure any fruit grower of ninty per cent. of clean apples and in addition to this if some arsenical poison is used, will absolutely control all canker worms, cateterpillars, green fruit worms, bud moth, and the Coddling moth. A fourth spray without poisons must be used a wet season like 1912 about the twentieth of July to prevent a late infection of the "Black Spot" and the "Fly Spec Spot." This latter fungus does not show until after the apples are picked and have been stored for some time. It caused a lot of injury this past year, but was not found on fruit sprayed the later part of July.

It can be completely controlled by this late spraying. Now we may put our spray on at the right time, and use what science tells us is the very best fungicide and still get poor results unless the work of applying is done carefully and thoroughly. Every leaf as far as it is possible should be covered. With lime-sulphur it is safe to give the tree a good wetting down, indeed this is necessary if a thorough job is to be done. Use an angle nozzle and have one man on a tower six or eight feet above the ground; this man should carry a fourteen foot rod so he can reach easily to the centre of the trees on either side of him. The best work cannot be done if both men remain on the ground.

Anyone who raises one thousand barrels of apples cannot afford to do without a power sprayer; the initial outlay is high, but if the right machine is bought, one that will do the work with few costly breakdowns, they will soon pay for themselves many times over.

In the spring of 1911 about 150 power outfits were sold in the Valley at an average price of two hundred dollars apiece.

As many more have been bought since, so it is safe to say that $60.-000 has been expended the last three years for power sprayers. I believe we could also safely say that $30,000 of this has been utterly thrown away as far as any good it did the farmers was was concerned. Ten different makes have been sold by as many different firms and they all look alike when the agent is showing them off to the man who is not a born mechanic. Some,perhaps the majority are giving splendid satisfaction, while others are utterly worthless for the purpose for which they are intended. A leaky pump that won't hold her pressure or an engine that won't go, standing in an orchard on a fine day when work is pressing will lead to more bad language than a balky horse. In buying an outfit one should look to several important points. First, there must be some system of mechanical agitation; we all know how Bordeaux and Paris Green settles to the bottom of the tank, Lime Sulphur and Arsenate of Lead also settle in a lesser degree, and the old fashioned return hose will not give power enough to keep any mixture stirred up. The engine should be compact, light enough to haul over soft ground and as simple as possible. In fact, it should be pretty nearly fool proof. Personally, I believe the jump spark system will give the fewest ignition troubles.

With the experience we have had so far, the open cylinder, single acting pump seems to give the best satisfaction. On the double acting pump the stuffing box, as soon an a little wear takes place, is likely to give trouble. Experience has shown that it is almost impossible to keep it tight after the first season. The by-pass valve or safety valve that allows the liquid to pass back to the tank when the spray is cut off is another important point to look to. Spray materials are very corrosive stuff and will cause some valves to wear or stick so that they are soon of little use. If they do not work something is likely to break.

So with all these pitfalls to look out for it is well to buy only from a firm whose machines have given good satisfaction in active service. No one can judge a sprayer on the show room floor. It is not always safe either to take the word of a fellow fruit grower as to the satisfaction his machine is giving. We all hate to acknowledge that we have been taken in, and frequently the man who swears by his machine in your hearing will be swearing at it as soon as you are out of sight.

For the man depending on his orchard for his living this question of better fruit is all important. If we have over production in the future it will be of No. twos and No. three, never of No. ones and fancys. Spraying, thinning, prunning, cultivating, fertilizing, all are necessary and of all these spraying is not the least important.—M. K. E.

Need of Lime in Garden.

Lime should be applied to vegetable soils every four or five years, half a ton to two ton an acre. It frees plant food, improves the physical character of the soil, neutralizes acids, is unfavorable to certain diseases, and is of especial value in the improvement of refractory soils, such as the city home garden must often use or do without a garden. Any of the three ordinary forms are satisfactory, but the gardener must be sure the price is in proper proportion. Ratios of value are: Fifty-six pounds quicklime are equivalent to 74 pounds water-slaked or hydrated lime, and to 100 pounds limestone rock or air-slaked lime. Good physical condition for distribution is very important. This material is best applied broadcast in the spring after plowing. It should not be used in advance of potatoes, as it favors scab. No increase in single element of soil treatment will bring the highest returns unless all other essentials are present in proper proportions. No amount of nitrogen will bring a good crop if the soil is in bad physical condition, or if the mineral elements are lacking.—Prof. Paul Work, New York State College of Agriculture.

Use For Tin Cans.

If the roots of such vegetables as cucumbers, melons, eggplant, peppers and sweet corn are disturbed, though the disturbance is ever so slight, they are impatient of transplanting. Lima beans and tomatoes especially are put back by transplanting in the usual way.

A good method in such cases is to take a lot of old tin cans and place them in a bonfire in the garden. A stove could be used if more desirable. Leave the cans in the fire until the solder is all melted off and the cans fall apart. The cylinder that forms the sides should then be tied with a string. Place the bottomless can on a board, if the plants are to grow in a window, or they may be put at once in a hotbed or cold frame.

Fill the cans with rich earth and sow a little seed in each. Keep in a shady place and water frequently till sprouts appear. They should be thinned after the first pair of true leaves have formed. Leave just the proper number of plants for a hill. In the case of tomatoes, peppers and eggplant only one plant should be left.

When ready to plant in the garden they should be watered, then the string cut. The can will slip from the compact ball of earth, and it may be set in the hole without disturbing a single root. Flower pots may be used, but they are expensive. Tin cans are always at hand and easily prepared.

Demonstration Orchard Work in New Brunswick

(Continued from page 459)

this year sprayed, plowed, harrowed and seeded to clover, but not manured or fertilized. Both sections of the orchard bore very heavily indeed in 1911, but the recuperative power of the trees well pruned, sprayed, cultivated and thoroughly fertilized over those not fertilized and cultivated, and only partially pruned and sprayed, is well shown in the 280 barrels of fruit obtained from the 210 trees in the demonstration orchard as against the 225 barrels obtained from the 410 trees in the home orchard. The expenditure and receipts for the home orchard are as follows:

EXPENDITURE OF SPRING OPERATIONS.

13 bbls. Winter Spray applied at $1.54	$20.02
10 bbls. Summer Spray applied at $1.12	11.20
Plowing, 4 days at $3.50	14.00
Harrowing, 2 days at $3.50	7.00
Clover Seed, 70 lbs at .26	18.20
Sowing Clover Seed	.75
Deprecation of Spraying outfit	2.50
Total	$73.67

EXPEEDITURE OF HARVESTING AND MARKETING.

225 bbls. delivered at .30	$67.50
Picking and packing 225 bbls. at .25	56.25
Hauling to market 225 bbls at .10	22.50
Market Fees, 225 bbls at .05	11.25
10 p. c. Sale Commission on $562.50	56.25
Total	$213.75
Interest at 6 p. c. on $2,500 value placed on the 5 acres by Mr. Steeves	150.00
Spring Expenditure	73.67
Total Expenditure	$337.42

REVENUE.

225 bbls. at $2.50	$562.50
Total Expenditure	437.42
Net profit on 5 acres	$125.08

Net profit per acre $25.01 which on the valuation of $500 per acre is a return of 5 per cent.

THE SUNBURY COUNTY ORCHARD

This orchard is situated on the eastern bank of the St. John River at Maugerville, on high intervale land. The soil is a dark loam several feet deep and is exceedingly fertile, being part of the old river bed. The orchard is in sod and never cultivated, the ground being moist and rich enough to produce good hay crops, and at the same time to keep the trees growing thriftily and producing well. There are about five hundred bearing apple trees, eighteen years old, 20x20, nearly all of the Wealthy and Duchess variety. The Duchess trees have far outgrown the Wealthy, and have twice the bearing surface of the latter. One block of sixty Duchess and another block of 100 Wealthy, covering in all about one and two-thirds acres, were taken under control by the Department.

EXPEEDITURE OF SPRING OPERATIONS. 1

6 days pruning at $2.00	12.00
1 days scraping and painting at $1.50	1.50
1 gal. paint, at $2.25	2.25
1 day hauling brush at 3.50	3.50
12 loads manure applied one half chargeable to 1913, at $1.50	9.00
8 bbls. Winter Spray at $1.54	12.32

Portion of Crimson Beauty Orchard. Rows 24 feet apart; Trees 8 feet apart in the rom. Planted by Franklin Sharp in 1887.

4 bbls. Summer Spray at $1.12	4.48
Depreciation of spraying outfit	5.00
Total	$49.05

EXPENDITURE OF HARVESTING AND MARKETING.

358 bbls at .25	$89.50
Picking and Packing 140 bbls. Wealthies at .18	25.20
Picking and packing 200 bbls. Duchess at .13	26.00
Picking and packing 18 bbls. Ben Davis at .18	3.24
Hauling to wharf 358 bbls. at .02	7.16
	$151.10
Intecest at 6. p. c. on $660.00 value placed on the 1 2-3 acres of orchard by Mr Clark	40.00
Spring expenditure	49.05
Total expenditure	$240.15

REVENUE.

84 bbls. No. 1 Wealthy at $1.75	$147.00
56 bbls. No. 2 Wealthy at $1.25	70.00
160 bbls. No. 1 Duchess at $1.75	280.00
40 bbls. No. 2 Duchess at $1.25	50.00
13 bbls. No. 1 Ben Davis at $2.25	29.25
5 bbls. No. 2 Ben Davis at $1.75	8.75
Total Revenue	$585.00
Total expenditures	240.15
Net profit on 1 2-3 acres	$344.85

Net profit per acre $206.91, which on a valuation of $400 is a return of almost 52 per cent.

THE YORK COUNTY ORCHARD

This orchard is situated at Douglas, on a strong southern exposure to the St. John River, and contains about 130 trees of various ages and sizes, planted different distances apart, most of them about fifteen-by-twenty feet. This orchard has not been plowed for fifteen years, and when taken hold of there was much dead wood in the young growth and almost every tree had developed large trunk wounds from sun-scalds, and were more or less affected with black rot canker. The soil is a medium red loam with gravelly sub-soil. The varieties were as follows: Duchess, Alexander, Wolfe River, Fameuse, Wealthy, McIntosh Red, Montreal Peach, Switzer, Bishop Pippin, Bethel, Eccles Pippin, Gano and others. The owner placed a valuation on this orchard of $150 per acre in 1911, but has now doubled that valuation.

EXPENDITURE OF SPRING OPERATIONS.

2 days pruning at $2.00	$ 4.00
½ day hauling brush, 2 men and team	2.50
1000 lbs. basic slag, 900 lbs sulphate of potash and 430 lbs. nitrate of soda, applied in 1911, $46.98, one half charged to 1912	23.49
Freight on fertilizer and hauling same to orchard $3.00 half charged to 1912	1.50
6 bbls. winter spray applied at $1.54	9.24
8 bbls. summer spray applied at $1.12	8.96
Depreciation of spraying outfit	5.00
	$54.69

EXPENDITURE OF HARVESTING AND MARKETING.

Picking and packing 290 bbls at .20	$58.00
Hauling to market and selling including depreciation in value of barrels, 290 bbls. at .30	87.00
Total	$145.00
6 p. c. interest on $450. the value placed on the 1½ acres of orchard by Mr. Hawkins	27.00
Spring Expenditure	54.69
Total expenditure	$226.69

REVENUE.

10 bbls for home use at $2.50	$25.00
21 bbls. Duchess at $1.54	32.38
10 bbls. Red Astrachans at 1.42	14.20
3½ bbls. Switzer at $2.32	8.10
49 bbls. Wealthy at $1.64	80.36
3½ bbls. Irish Peach at $2.03	7.10
2½ bbls. Dudley Winter at $1.30	3.25
3 bbls. Gideon at $1.57	4.71
21 bbls. Alexanders at $1.56	32.76
1 bbl. Wolf River at $2.50	2.50
2½ bbls Haas at $1.60	4.00
6 bbls. Scott Winter at $3.00	18.00
1 bbl. Twenty Ounce at $2.50	2.50
2½ bbls. Peewaukee at $2.50	6.25
1½ bbls. Bishop Pippin at $3.00	4.50
8 bbls. Milding at $3.50	20.00
5 bbls. Eccles at $3.00	15.00
1 bbl. Gano at $2.25	2.25
32½ bbls Fameuse at $2.84	92.30
68½ McIntosh at $3.25	222.62
25½ bbls. Bethel at $3.00	76.50
11½ bbls. Sudbury's and various others at $1.92	22.07
43 boxes Exhibition Fruit at $1.00 (clear)	43.00
Total	$739.31
	226.69
Net profit on 1½ acres	512.62

Net profit per acre $341.74, which on the valuation of the owner of $300 per acre is a return of almost 114 per cent.

NOTE.—It should be mentioned that the majority of the trees in this orchard are quite small, there being only about ten large trees and twenty-five of medium size.

COMMENTS.

The apples in the Demonstration Orchards were not generally so clean and free from diseases this season as last. In the Douglas orchard the McIntosh and Fameuse were attacked by a late outbreak of apple scab appearing in August. The same was true in the orchard at Lingley, most of the fruit in that orchard being infected when about half grown. A period of moist warm weather at that time favored the spread of the disease and wherever spores fell upon susceptible varieties scab spots appeared. In the Coverdale orchard, scab developed to a considerable extent early in the season and was probabl- due to neglect of thoroughness in spraying. In the Maugerville orchard the fruit was uniformly clean this season.

The Douglas orchard was not cultivated this year, but the roots of last season's crop sent up a strong thick growth, which was cut in June, when about twenty inches high. A thick second growth came up in the fall and went into winter in good condition. Owing perhaps to the wet season the cover crops sown in the Coverdale orchard only made a fair amount of growth this year. Summer vetches grew about six inches high and mammoth clover and winter vetches about five inches. Crimson clover made but slight growth. In the Lingley orchard summer vetches formed a good thick coating over the ground while mammoth clover and winter vetches only grew about four or five inches. Crimson clover was so infested with weeds that little or no growth was made.

The Friendly Garden.

A garden seems like some good friend,
Long known, long loved of old,
With whom hours joyous have been passed
And mirthful stories told.

The paths familiar to the feet,
Each bed, each box, each row—
Each has a greeting like a friend
Of happy long ago.

The days we spend in labor there
But make us better friends,
And for reward the garden gives
Rich hoard of dividends.

It is a friend who never speaks
A harsh or bitter word;
It is beloved of wind and sun,
Of bee and humming bird.

It waits with welcome ever kind
To those who gladly come:
Blessed is the heart who has and loves
A smiling garden chum!

—A. R. W. in New England Homestead.

The Culture of Cranberries a Profitable Business

Gleaning a Revenue From Boggy Land

By C. N. Vroom, St. Stephen, N. B.

NEW BRUNSWICK abounds in tracts of land, varying in area, now considered as waste, but which might be made among the most profitable parts of the farm. Wet, peaty soils, of little use for other purposes, are eminently suitable for the culture of cranberries, and the expense of preparing and planting is not excessive, when the length of life of the bed is considered.

The proper soil for the culture of this berry, is a peaty, alluvial soil. A peat bog, if not too deep, or any black land on which wild bog cranberries now grow, will present a suitable home for the cultivated berry. Beds are sometimes made on an ordinary very sandy loam, but such soil requires the annual application of commercial fertilizers, which are not required on black soil, and it runs more to weeds than a peat soil does. A wet soil with the water table near the surface, is the best, and this should be ditched and drained until the water recedes to within 10 or 12 inches of the surface. The first operation in preparing a bed, is to strip the sod or turf from the surface sufficiently deep to prevent the growth of bushes, grass or weeds from the roots. This will be a hand job generally, as the ground is often too soft for horse work and is apt to contain many sticks and logs with which it is hard to deal except by hand. After the ground is cleared and levelled, it should be covered to a depth of three or four inches with sand, free from loam or weeds. A coarse sand, in which is some gravel, is suitable. Many shallow peat bogs have a deposit of sand underneath, and where this is the case, the sand can be conveniently and cheaply obtained from the bottom of the ditches. After the sand is spread, the rows should be marked out 18 inches apart, which may be done by drawing over the bed an instrument made like a hand sled, with two or more runners the proper distance apart.

The bed is now ready for planting, which should be done in the latter half of May. For this purpose, cut vines are used, being the upright parts of the vine, mowed from a bearing bed. These may be obtained from some reliable dealer, who makes a business of supplying them, care being taken to get good varieties. These are put up in sacks or barrels, about eight barrels being necessary for planting an acre. These vines will be six or eight inches long, and the process of planting is very simple. One hand drops the cuttings in the marked rows, about 15 inches apart, and another follows and presses a part of the cutting into the soil with a stick notched on the end. A pressing of the sand about the cutting with the foot completes the operation.

In the after treatment of the bed, the most important thing is weeding. If the ground has been well stripped and the sand is clean, this will not be a very difficult operation, but it is important to keep down the weeds and give the vines a chance to grow. If this is faithfully done for three years, by the fourth year the vines will take charge, completely covering the ground, and reducing the task of weeding, almost to a vanishing point. By this time also the bed will be yielding profitable crops. No cultivation is required, and in fact it is desirable in weeding to mix the sand with the soil as little as possible. Properly brought to this point, the bed is in shape for many years to come, and requires little attention but picking.

There is a very general impression that cranberries cannot be raised without provision being made for flooding them, but while such an arrangement is desirable, it is not a sine qua non. Cranberries are grown quite extensively through the Annapolis Valley, and in many cases there is no provision for flooding. The owners of these beds figure that they may lose their crops by frost once in four or five years, but even thenthey consider the business profitable. Where the bed can be located on a small stream however, so much the better. A dam may then be built so that the bed may be flooded to a depth of 18 inches or two feet, with a gate that may be easily opened and closed. Water should be turned on in the spring and allowed to remain until about the 20th of May, so that the period of blossoming may be retarded to escape the June frost. Again in the autumn, if heavy frost is imminent before the berries are picked, the gates may be closed in the afternoon and the bed flooded for the night. A clean sanded bed, however, will not catch the frost so quickly as a bed full of weeds and grass.

The above is a brief outline of the process of cranberry growing, and only calculated to call the attention of farmers to this industry which has received little attention in New Brunswick, and to which the province is specially adapted. The cranberry is a cold climate plant and will grow to perfection here. We have not the same insect enemies to contend with that are prevalent in some parts of the United States, while our prices are better and the demand is practically unlimited. A well established bed will yield from 50 to 60 barrels to the acre, and the price seldom drops below $5 per barrel. This is good enough for land that is practically useless for other purposes. In starting a bed, not only is it desirable to get a variety of good quality and appearance, but they also should be prolific yielders. There is as much difference in the yield and quality of cranberries as of apples. Some of the wild varieties are good, but they should be tested before setting a bed of them. New varieties come from the seed as they do in apples and other fruits, and some of the best berries grown in Nova Scotia, are native varieties. The cranberry is the best keeping fruit that we have, in ordinary storage conditions, and in its culture is an opportunity to add greatly to our farm values and to the prosperity of the province.—C. W. Vroom, St. Stephen, N. B.

How I Grow My Own Nursery Stock of Apple Trees.

Editor The Maritime Farmer:—

I am much interested in horticulture and, consequently, I am glad that the people of New Brunswick are waking up to the fact that as good fruit can be grown in their own province as anywhere.

It may be of interest to some of your readers to know my method of growing apple trees.

From a seedling or native apple tree I gather the apples after they are frozen. I extract the seeds and the following spring I plant these seeds in my garden, two feet apart, the soil having been put in good condition and free from weeds. After the little seedlings come up I keep the ground thoroughly cultivated and free from weeds.
